For a year or more your troubles and anxieties have been more than paralleled by those which beset your customers. It is very trying for a private owner when successive price reductions cut the value of a machine which he tends as carefully as if it were mother's first baby. It is no less trying when he tires of it and desires a new mount, to find that the cut prices of dumped over-production stuff render his year-old machine practically unsaleable. I know one ex-officer who spent his gratuity (nearly £300) on an excessively posh four-cylinder outfit, complete with every conceivable gadget. When the slump came, he attempted to unload. He began by asking £200, worked down by easy stages to £75, and eventually took £50. Buying can never be brisk when canny men foresee such shattering losses. So our present optimism is firmly founded on the fact that *prices are at last stabilised very near the datum line.* You have had your troubles. We have had ours. They are very nearly over, let up hope.

Keen and Too-Keen Competition.

I can clearly foresee that your next anxiety will arise out of throat-cutting competition. Traders meet competition in various ways. A certain steamer line once had a monopoly and abused it. Bad boats. Slow passages. High fares. Heavy freights. General callousness about their passengers' interests. A rival syndicate started to run boats in opposition. Fierce competition arose. Tickets were cut down to 'bus fare levels. They gave you free grub on the boats, and if choppy seats prevented any passenger from devouring the comestibles, he had a coupon available at a restaurant when he landed. One of the companies cracked under this pressure. The survivor regained the monopoly, and proceeded to grind the faces of its passengers once more.

The Paying Policy.

Or again. On the water front at 'Frisco there are a lot of cheap eating houses which compete for the custom of seafaring men. At times competition becomes acute. But one small restaurant always thrives. It keeps its charges down to the lowest economic level. It never provides frozen meat. Its coffee is never brewed from bad barley. It eschews the sort of sour-faced waitress who chucks your food at you with a snarl after keeping you waiting for ten minutes or more.

Honest Value. Minimum Prices. Good Service. These are the thing which tell. In the course of time they always defeat the dishonest trader, who sends out dud stuff, however cheap, and forgets all about you when once he has cashed your cheque. It is odd how incompletely these elementary maxims are grasped by some commercial engineers. At an earlier crisis in the industry I particularly remember two firms. Jones had a design which was dull, commonplace, and only just roadworthy. Smith had a genuinely brilliant layout. Smith called in a receiver, and Jones is still paying fat dividends. The explanation was that Jones limited himself to first-class material, employed the best labour obtainable, tested and inspected all through as hard as ever he could, and in the rare event of any client meeting trouble, met him on the doorstep with open hands. Smith was a friend of mine. He sent me down a sample of his new model. It went through three gear boxes in as many weeks. Soft stuff. Slung together anyhow. No tests. No inspection. And absurd charges for replacements. He has started again with some more money which somebody provided, and ever since those days he has had to spend thousands in advertising, trying to steal new customers; for his old ones won't touch his stuff with a barge pole.

Maintain Quality.

The competition that lies ahead will bring violent temptation to many firms whose post-war manufacture has been inspired by the highest engineering and trading principles. In the old days, when the golf

An Open Letter to the Trade.—

caddies at St. Andrews were definitely trained, they used to ask the aspiring kiddies: "What would you make a tee with?" The usual answer was "With sand." But the boy who replied "With brains" went up a place on the list. The same applies to a motor cycle. It is easy to cheapen a motor cycle by using dud stuff, or cheap labour, or simplifying inspection, or neglecting tests, or hardening up the service organisation. But the only policy that pays is to maintain the quality, and to cut the cost by sheer intellectual *tours de force*.

Wonderful Performance and Reliability.

Technically, we have had a splendid year. Your machines are internationally recognised as invincible—the envy and despair of all other manufacturing nations. You get more out of a 350 c.c. four-stroke than your rivals can squeeze from 500 c.c. Your baby two-strokes are as full of kick and wear as the full touring layouts of other nations. Even the big twin, which is only a sideline with us, has, thanks to Le Vack and J.A.P., surpassed American achievements on the track. The stock shelves have accurately reflected the shop window. Behind your competition successes stand a great host of satisfied private owners. Indeed, their satisfaction is so deep founded that it begins to make trouble for you. Riders keep their machines longer than is healthy for an industry which hardly possesses any export trade. The quick recovery of that export trade is one of your chief problems. In the old days you had no special cause to cultivate it. It fell by default first to the Neckarsulmer people of Germany, and later to America. You just accepted that share which came your way automatically, without going out to look for more. To-day the aftermath of war has shorn off most of it. Meanwhile many riders are keeping their excellent 1922 mounts for 1923, and perhaps for 1924 as well. Export is indispensable.

Roads aren't quite what they used to be, are they? I commend, to your temporary notice at any rate, the claims of the big tyre. No doubt the spring frame is the ideal. But it is neither easy to design nor cheap to make. Tyres are at last really cheap. Three-inch tyres confer an incredible addition of comfort, plus reduced upkeep charges and an amazing immunity from road stops. Very, very few makers of small or medium machines yet list them, even as an option.

Cycle Cars and Sidecars.

It is alleged that your big sidecars are seriously threatened by some of the new cycle cars. I have not seen a cycle car which I regard as dangerous. I think the alarmists overlook two factors. It is perfectly true that the little 8 h.p. Rover car, for example, is now down to £180, and has an enviable reputation. Even at that, one swallow does not make a summer, and the 8 h.p. Rover is not a typical motor cyclist's vehicle. There is nothing sporting about it; and most motor cyclists are at least semi-sportsmen. Moreover, the price is not low enough to compete with us. The "J" model Matchless sidecar outfit, for instance, a fine machine of considerable popularity, is priced at £50 less. And between £180 and £130 there is a great gulf fixed in the motor cycle world, as anybody who has sold machines on easy payments is well aware. We may not be able to posh up our big sidecars quite as much as we used to do, but there are stacks of life in them yet; and if their knell is ever sounded, the 500 c.c. and 600 c.c. and 750 c.c. outfits will still be quick sellers. I fancy I heard the O.K. people murmur something about 250 c.c. at this juncture?

Sport and Transport.

The shadows of two approaching changes in the industry are just visible, though neither of them is as yet vital. Ten years ago the essence of motor cycling was "sport." Ten years hence its essence will be "transport."

Transport is an economic matter. The same change has already passed over the pedal cycle industry. At 1900 period I bought a new push-bike every year. I bought my last push-bike in 1911, and it still looks well and is in perfect order. Durability of mechanism, and not less of external finish, counts more every year. An "all black" Sunbeam push-bike is handsome when it is five years old. Sooner or later we shall all want motor cycles capable of the same miracle. With the accompanying reduction in home sales, due to a slower consumption rate, export trade will become annually more and more vital to the industry. Simultaneously, we cannot apply the word "transport" to a machine which is never put on the road in winter or after dark. When motor cars had no hoods, no windscreens, and dashboards about 6 in. high, they stayed in their stables from October till April, barring an occasional sunny afternoon. When their lamps were fed by crude gas generators or paraffin reservoirs, they sped home towards sunset, just as the birds do. Then scuttles and all-weather bodies relieved the driver of all yearnings for China goat-skins, and dynamos solved the illumination problem. The car was moved from the sphere of sport into the sphere of transport, and sales multiplied exceedingly. A similar process must occur with motor cycles, though it will be less smooth and easy.

Protection and Lighting.

I notice that various experimentalists are already busy. I hear that there will be three full screen systems for motor cycles at Olympia. Dynamos we have already seen offered for some seasons; but, my dear sirs, the price! They have often added £30 to the cost of a £120 machine. Now a man may be willing to pay £2,100 for a 40 h.p. six-cylinder saloon; but where will you find the man to expend £700 on a lighting set for it? I fully admit the difficulty of providing satisfactory electric lighting as a £10 extra. But the need will create the supply. It is a vital element in the switch-over from "sport" to "transport." In the meantime, those firms who are trying to acquire a big trade in lighting sets will pave the way to good business in so far as they render their dynamos transferable from one machine to another. I am at present using generator lighting (which I loathe), simply and solely because there is no cheap dynamo which is designed to take off my 1922 'bus and go straight on to my 1923 'bus.

An Open Letter to the Trade.—

I think you will find your local agents no less grateful than your auxiliary industries if you contrive to simplify the subsequent attachment of such important gadgets as dynamos, speedometers, and the like. Keen agents are a great asset to the manufacturer. Even now, when every rider who can afford to do so buys a new mount every year, there is not an awful lot in a small motor cycle agency. The commission is not great, and an inpecunious buyer without liberal notions of business expects a lot of gratis service or cheap service. He is often as much of a nuisance to the supplying agent as a profit and a joy. In years to come, when the poor agent is selling a machine at £50 to last five or ten years, his lot will be worse. Comfort and enrich that agent by encouraging your inpecunious clients to order valuable accessories every now and then, making the deal a source of income to the agent. After all, your buyer has a papa and a sweetheart. Christmas comes every year, and every man has a birthday. Why not a dynamo set (just a bolt-on job) at the first birthday after purchase? A speed indicator (integral drive being arranged for) at the following Christmas. At the present time lots of invaluable accessories do not find the market they deserve, first because they are so awkward to fit, and secondly because their fitting, never having been allowed for in the design, spoils the clean lines of what was an engineering job till they were added.

Better "Service" Needed.

It has been my misfortune or privilege to reside in widely separated parts of England, and I know what a big country it is. It is one thing to own a motor bicycle if you live in Leamington. Quite another if your lines are cast in Penzance, or Aberystwith, or Dundee. The "service" which is so prompt and simple at a radius of twenty miles from the factory seems so slow and awkward if you are 300 miles away. Particularly if—as often happens—you are in the middle of your short annual holiday when something goes.

Surely the time is coming when the big firms of the industry should have established service depôts capable of rendering in the remoter counties the same efficient attention which Coventry and Wolverhampton can supply in their own neighbourhood? Take, for example, the man who goes to Devon in August with a big sidecar outfit. He sustains a mildish crash. His holiday is terminated, and also ruined. He has to choose between sending the outfit bodily 200 miles or so by train, and re-collecting it at a week-end three weeks later, all of which entails a stupendous expense for an income of his class. Or, alternatively, he has to entrust it to some local worthy, who may or may not be efficient. I have known cases where a machine, locally repaired in such an alternative, was never the same again; and a disgusted owner unloaded it angrily a few months later. But if his maker had a service depôt at Exeter, or Bristol, or Plymouth, the wreck would be put in the nearest train; a night staff might possibly start work on it in the same day.

"Free in the Land."

Greedy people we motor cyclists, aren't we? Always grasping what you offer with both hands, and yelling for more? But the main fact of our common relations is that you have inspired us with such appreciation of your courtesy, your readiness to meet all our wants, and your ability to accomplish the impossible that we regard you with the naïvest confidence. Still, I should not represent public feeling if I failed to conclude with a heartfelt expression of our thanks for the key of the open road which you have put in our hands. At an absurdly small cost and with remarkably few and petty interruptions, we find ourselves made free of these glorious islands, which we now know and enjoy in a manner which would have been absolutely impossible without your skilled and kindly assistance. We hope our pleasures are duly reflected in your profits; and we intend to support you in 1923 as you have always supported us.

I am, gentlemen, yours very faithfully,
B. H. DAVIES.

THE CLUB RUN. A recollection of the sunny days of summer. Despite the dust, riding in close company up a hill is good fun and provides instructive opportunities for comparing the performances of touring models. Buckhaw Brow, near Settle in Yorkshire is the hill depicted.

DIRECT BELT DRIVE'S FASCINATION

Thoughts Provoked by a Ride on a Single-geared Big Twin. How much have Motor Cycles Improved?

EVERY sphere of life has its "good old days"; to the motor cyclist, if we are to believe what we hear, the phrase is particularly applicable to the pre-gear box era.

Probably so. Certainly most so-called veterans have happy memories of some fine piece of riding on a direct belt-driven machine, some feat that nowadays would surely call for second, perhaps for low, gear. We all talk glibly of the wonderful amount of enjoyment there is to be extracted from a good single-geared motor cycle, of how only thus are the full niceties of driving exercised, and then we order the latest chain-driven mount complete with three- or four-speed gear box and clutch.

Are we getting soft, or are the joys of direct belt drive considerably exaggerated? It was with some idea of answering the riddle that I accepted recently the offer of a ninety-mile trip on Mr. A. D. Draper's old twin Matchless. I had only once been on a single-geared machine since August, 1914, and that not for long, so I approached the experiment in the proper spirit of critical apprehension, thoroughly spoiled by many thousand gear- and clutch-assisted miles.

An Old Machine Modified.

The machine deserves a word or two of description. It was made in 1907, but a great deal of its components are considerably younger. For example, it has been re-bored and Ricardo pistons have been fitted; the valve timing has been altered, and the carburetter has been set to give an exceptionally strong mixture at low speeds. 4 m.p.h. to 60 m.p.h. is its speed range, figures not reached by many a so-called sports model of 1922. Last, but not least, it has a spring frame and spring forks of Mr. Draper's own design, which was illustrated in *The Motor Cycle* of November 2nd.

I took it over at Staines, with Uxbridge first and then Coventry as my objectives. To say it was a bit funny at first may be trite, and may be bad English, but it exactly describes my sensations. The controls worked in the reverse way to those of my machine, and the brake was not notably effective. For a dozen miles we plunged more or less haphazardly through the bye-lanes in an endeavour to strike the Oxford Road, Mr. Draper on my machine setting a healthy pace.

However, there were few controls to master, and as soon as I realised that neither the air nor the spark lever was a mere ornament all went well. It was worth it, if only for the satisfaction of trickling through the Saturday afternoon crowds in High Wycombe and then roaring up the long hill a few miles further on, on the same 4 to 1 gear.

Comfort on Rough Roads.

We short-circuited Oxford, not because I feared it, but because I wished to learn the alternative route. By the time, creditably short, that the outskirts of Coventry were reached I felt ready to traverse London from north to south. The spring frame proved rather remarkable. It acted. Furthermore, there was none of the usual bounce of the usual frame. Hitting a pot-hole did not mean a series of cushioned bumps instead of one jar. The sensation resembled that of a rigid frame on dead level roads. Which is what a spring frame ought to give. The Matchless handlebars are of the sit-up-and-beg type, but the steering was excellent.

To return, however, to our original theme. Has the single-gear machine any fascinating element which the best chain-driven variable-geared machines of to-day lack? Frankly, I think not. Its sole fascination lies in the fact that it has only a single gear. And that may be rather valueless satisfaction at times.

Mr. Draper's Matchless is an exceptionally fine example of its type—lively, vibrationless, and flexible, yet, cutting the suspension system out of the discussion, my own chain-driven single, thanks to a well-balanced engine and a most efficient transmission shock absorber, is just as pleasant to drive under any circumstances whatsoever. Motor cyclists are not growing soft; motor cycle design has made more progress than most of us realise.

A. McL.

THROUGH FEMININE GOGGLES.

The Lightweight as a Hack.

By MABEL CORSELLIS.

WHEN a woman buys a motor cycle she usually wants to be able to utilise it for a variety of purposes. It is of little benefit to the average woman to possess a machine which will perform miracles on Brooklands if it is awkward to drive in traffic or is too high in the frame to allow a short skirt to be worn on occasion.

From Pedal to Motor Cycle.

In 1915 I was still riding an ordinary bicycle, as were most other girls, and everywhere I went my bicycle went too as a matter of course. I used to carry innumerable parcels on it—my tennis racquet, golf clubs, bathing kit, pic-nic basket, or whatever I required at the moment.

In 1916 I bought my first motor cycle—a 1914 T.T. Ivy—for £14. At first it would not run, but by the time I had fitted another magneto it went very well indeed. I could not, however, do the things I did on my old push bike. That Ivy had the petroil system, no gears, no kick start, no clutch, and T.T. handle-bars. The frame was too high for skirts, so I could only use it when breeches were permissible. Still, it was a good 'bus, and I once safely carried a dozen eggs in a basket on the handle-bars for 10 miles over a fairly bad road!

So much for my first mount. My last lightweight was a Cedos, and I had it nearly a year before a dealer in Euston Road swallowed it up.

Lightweight on the T.T. Course.

Next to the discarded push bike, the Cedos (known to my family as The Fuzz-Box) was the most useful machine I have had, and very reliable. I had it for six months in the Isle of Man, and thought nothing of the T.T. course, which is a pretty good test for a small engine. When I was a marshal at Craig-na-baa corner during the practices eighteen months ago, I had to rise at the chilly hour of four and ride about 5 miles, all uphill. I never had any difficulty in starting, in spite of the cold, and often took a passenger on the carrier. Slight belt-slip going up the mountain was the only trouble.

I once came home to Douglas from Ramsey over the mountain road with a T.T. Scott and a Scott sidecar. It was slightly foggy (which, with the atmosphere at that altitude, suits the Cedos carburetter very well), and I astonished myself and the others by doing the journey in 25 minutes—about 16 miles. Which shows that one *can* have a sprint occasionally, though I don't advocate "hogging." I always used the Cedos for going to tennis, but found it safer to carry my racquet strapped to the carrier than under my arm, and for this purpose I wore a short skirt and loose coat, which was rather uncomfortable, but practicable.

A Gear Control Alteration.

I had one rather drastic alteration made to the machine. From the very beginning I had trouble with the gear, which was operated by a cable from the left handle-bar. The gears had an incurable habit of jumping out of top into neutral, which at any speed produced much roaring from the engine. Also, neutral was very difficult to find when wanted. So I had the whole thing taken off and a tank lever and quadrant fitted, after which I had no difficulty.

Another slight drawback which was noticed by a T.T. rider during a trial run was the small clearance under the footboards—they were apt to catch when leaning over for a sharp corner, particularly if the ground was uneven.

A Tractable Machine.

Later in the year I brought the Cedos to London and found it just as tractable in traffic as on my own mountainous island. The acceleration was good, yet if necessary it would potter along at about 3 m.p.h.

Economical on fuel and oil, with good spring forks and easy balance and steering, the Cedos, I consider, is a most suitable machine for the woman who wants a *real* motor cycle and one that at the same time can be used as a hack machine, while the modern accessories of clutch and kick starter obviate any great exertion.

THE MOTOR CYCLE

SHOW REPORT.

Next week's issue of "The Motor Cycle" will prove worthy of preservation for months to come. It will be greatly enlarged, profusely illustrated, and will embody a stand-to-stand description of the Motor Cycle Exhibits at Olympia.

ON SALE DURING THE SHOW.

Costs and Upkeep Once More; Where the Three-Wheeler Scores; An Old Sidecarist's Disappointment at the Car Show.

By "FRIAR JOHN."

A WEEK or two ago I wrote about the comparative production costs of an orthodox small four-wheeler and a powerful sidecar outfit. I maintained, and still maintain, that the former is not likely to affect the sidecar market. Amongst the several interesting comments on the subject is one from Mr. Frank Philipp, of the Scott Autocar Co., Ltd. He considers that this phantom car so many people have been talking about will have to possess more important advantages over the sidecar than those of orthodox appearance and silence if it is to drive the three-wheeler from the road; he also says that I had overlooked other important requirements in my arguments. Before I touch on Mr. Philipp's views I ought to say that I purposely endeavoured to set out that on manufacturing costs alone the sidecar could always meet small car competition. I refrained purposely from discussing the advantages of the sidecar from economical and other standpoints and from making the question triangular by dragging in the three-wheeler. If it should ever come to arguing that the three-wheeler might eventually kill the big sidecar, I could make quite a good case for the former. But it has not come to that.

Mr. Philipp, to quote his letter, says: "Even assuming, for the sake of argument, that a little car may eventually be produced at a figure competitive with that of the high-powered sidecar outfit, before the sidecarist is going to abandon his well-proved vehicle, the four-wheeler will have to offer more than merely conventional outline, silence, or even complete weather protection.

"It will have to prove, first of all, that it is capable of giving the same road performance as the average high-powered sidecar outfit. Having satisfied this requirement, it must show that the running costs and upkeep are the same.

"In the first place: Will this little car ever be capable of giving the same road service (always bearing in mind that by 'little car' is meant a four-wheeled vehicle, costing approximately the same as a high-powered sidecar outfit and having an engine of approximately the same capacity)? Take the small cars at present on the market which most nearly approach this definition. Chiefly on account of their extra weight (9 or 10 cwt., against 5 or 6 cwt.), they are inferior at hill-climbing, acceleration, and speed on the level—probably to the extent of at least 10 miles per hour in average speed.

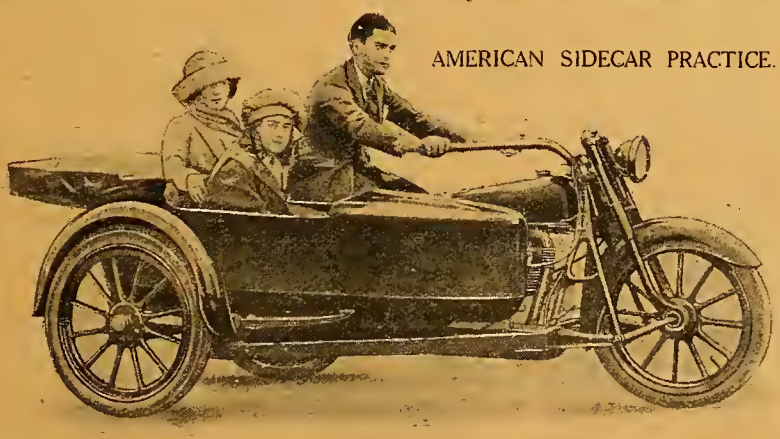
"They are undoubtedly inferior in their ability to hold the road at speed over indifferent surfaces—probably on account of their four-point suspension against the three-point road suspension of the sidecar outfit. Their mobility is vastly inferior and they are more liable to skid.

"Turning to the question of running costs and upkeep. In the case of the little car the petrol and oil consumption will be probably 50% higher (it is not logical to expect the same fuel consumption with a vehicle of nearly double the weight).

"As regards tyre wear, there will be probably not much to choose between the two types, as the extra weight of the car will be more or less compensated for by the driving load being distributed over two wheels.

"A very important point, however, which is often overlooked is the question of housing accommodation. The extra two or three feet of overall length of the little car mean, in many cases, that it cannot be stored in the existing accommodation without expensive and sometimes impossible alterations, and must be kept in a public garage—with all the attendant inconvenience and extra cost which that involves."

AMERICAN SIDECAR PRACTICE.



This sturdily constructed sidecar fitted with an artillery wheel is thoroughly in keeping with the heavy four-cylinder Militor to which it is attached, but the design may not appeal to British tastes.

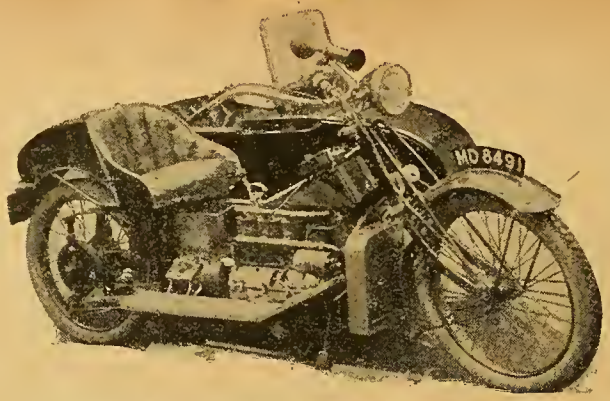
THE above arguments are irrefutable and are sufficient to indicate that a little car, even at sidecar price, would not have all its own way in this particular market. On the question of hill-climbing, a good

Passenger Machine Topics.— three-wheeler is undoubtedly faster than the majority of little cars costing £50 or £60 more than the most expensive sidecar.

A light small car certainly does not hold the road at 40 m.p.h. as well as a sidecar. Cost of accommodation is an item which—as Mr. Philipp emphasises—is often overlooked. For instance, I store one sidecar outfit at a garage for 1s. 9d. per week; the charge for a car like the Singer or cheap Rover at the same place is 6s. 6d. per week. I take up about half the space needed for a car.

Then take the question of taxation: the cost to run a car is £5 or £6 a year more than for a three-wheeler. In fact, at every turn the cost is greater. Garaging and tips in connection with a tour, say, of 600 miles would, I should estimate, be four times greater with a car than with a sidecar.

In fact, I have met very few people who dream of contending that sidecaring is as expensive as car driving. But I *have* met these people, and sooner or later they will find out their mistake.



LUXURY ON AN OLD MACHINE. A four-cylinder T.M.C. sidecar outfit which has seen many years of service. Its owner has lately equipped the machine with a C.A.V. dynamo lighting outfit.

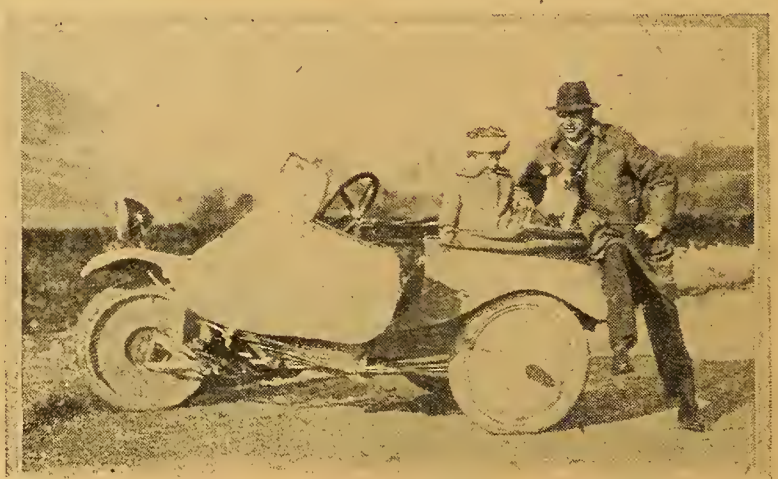
THE natural sequence of Mr. Philipp's letter was, of course, a reasoned argument in favour of the three-wheeler. Speaking particularly of the Scott Sociable, he says;

"Here you have a vehicle which embodies the chief practical advantages of the little car over the sidecar, weather protection, comfort, and sociability, and at the same time retains the particular features of the sidecar outfit which render it superior to the car.

"It is undoubtedly unorthodox in appearance, but then, Friar John, judging from his third paragraph, does not expect an orthodox car to be produced as cheaply as a sidecar outfit, especially if it is to be equally as refined in detail.

"Finally: Is it essential that a vehicle must be orthodox in appearance provided that it fulfils all requirements in other directions? The unorthodox appearance of the sidecar outfit has not prevented it becoming the most popular passenger-carrying machine on the road."

Even though it is naturally a biassed opinion, I consider it a sound and embracing summing up of the virtues of the three-wheeler.



THE SCOTT SOCIABLE ON THE ROAD. Although its unconventional design produced much comment when it was first introduced, the Scott Sociable is now so familiar as to attract little notice.

Whatever may be said against the three-wheeler (as apart from the sidecar), there is no questioning its superior comfort for the driver. We all know that. Yet, in face of the unbroken success of the Morgan, a runabout which has survived scores of experiments, the big sidecar has not been swept from the road. Tell me this: If manufacturers give us an increased assortment of three-wheeler runabouts equal in every respect to the big sidecar, will the latter still hold its own?

Now I've said enough about the poor old powerful sidecar.

AN acquaintance of mine, an old sidecarist, has this year turned car owner. He came to the Car Show and was disappointed. It was not the exhibits or the Exhibition that disappointed him, but something difficult to define. He missed the enthusiasm of the motor cycle fraternity, the goodwill and occasional hilarities. There was lacking that keen nosing after mechanical details with the majority of visitors, and, as I say, he came away disappointed *after ordering his £180 car.* I had known him long enough to say "It serves you jolly well right," and asked him if he really expected to get enthusiastic in ordering the very cheapest "cut line" in the Show. How can a man enjoy looking round superlative cars and then trudge to the very bottom of the class to give his order?

THERE lives to-day in a little village not far from Lincoln a man who built a motor cycle and sidecar. He started with an old J.A.P. engine (*circa* 1908) and after a year's toil built a sidecar outfit. On several occasions I have met the vehicle on my way to Skegness. I learn now that the owner—a carpenter who has run the machine for ten years—has *sold it* and has ordered a Scott outfit. What manner of man, I wonder, has bought the ancient sidecar, and what will be the feelings of the old owner on taking over his new outfit after trundling his old chaff-cutter round for ten years?

THE OUTLOOK

Messages from the North, South, East and West on the Further Expansion of the Motor Cycle Movement.

THOSE who are familiar in only a small degree with motor cycling as a movement realise that, large though it may be, it is at the moment small when compared with what it will become in the very near future. A glance at the Ministry of Transport Returns gives one a useful indication of conditions. Economic conditions have tended lately actually to reduce the number of motor cycles in use, but I feel convinced that this is only a temporary state of affairs.

The motor cycle is the poor man's vehicle, but its general excellence, the very high grade work put into it, and its extraordinary capacity for transport make of it also a vehicle for any individual, be he poor or rich. As a consequence, the use of this vehicle must and will increase very largely indeed. I look forward to the day, not so very far distant, when, with economic conditions improved and employment and markets more stable, a million motor cycles will be on the road.

If and when this position has been brought about, I think we should give credit to those who have helped to its attainment. Undoubtedly the constant striving after improvement on the part of the manufacturers goes a long way to make the movement more and more attractive. The steady betterment of our roads is another factor. Nor should one lose sight of the constant work of such journals as *The Motor Cycle*, the columns of which are of great value to the motor cyclist, and that of such organisations as the A.C.U., with which I have the pleasure to be connected. For these indubitably foster the movement.

Col. F. S. Brereton, C.B.E., Chairman of the A.C.U., who in this message states that he considers the motor cycle movement will progress at a rate which will astonish its oldest votaries.

For the young man and the young woman the motor cycle, in my view, provides the finest method of progression. The club movement gives him and her wonderful opportunities of friendship and of sport, while the trusty motor cycle and its sidecar attachment offer to the family man and to those no longer in their first youth a cheap, exceedingly reliable, and wonderfully comfortable method of seeing and knowing this beautiful country.

Given a more stable political situation, a peaceful outlook, and stability of purpose, I firmly believe that the motor cycle movement will progress at a rate which will astonish its oldest votaries, and will bring well-earned grist to the mill of those manufacturers who have so steadily persevered in good times and in bad. The manufacturers will then reap the reward they deserve for their efforts towards improvement.

NORTH OF THE TWEED.

SCOTLAND is a land of great distances. Draw a line from Stirling across to the shores of Loch Lomond, and north of that line are the Highlands, consisting for the most part of one gigantic deer forest and grouse moor.

Here the larger towns are mere specks upon the infinite, each far separated from the rest by many miles of winding, wind-swept road, each with its own industry, its own individuality, its own people. Thus such club life as exists over this vast area—and every town of note in Scotland has its motor cycle club—operates under conditions which seldom or never prevail in England. Each is a little self-contained community, self-supporting in every way, dependent entirely on the keenness of its own members, and entirely lacking the stimulus of healthy rivalry.

H. Mortimer Batten, F.Z.S., who writes on the outlook in Scotland.

Edinburgh and Glasgow have, of course, their prosperous clubs and their well-known annual events, and the great distances often covered by teams from outlying clubs to participate in these events are sufficient indication of the keenness of Scottish motor cyclists. But there is no doubt that Scottish club life stands in need of more competitive events. Barring the annual Callander Meet, there is practically no event by which the smaller clubs can hope to rise to distinction. This year

The Cut out.—

the cup in connection with the Callander Meet, which is on much the same lines as the Richmond Meet, went to the East Lothian Club in its first year.

One cup per year, however, is not enough. There are, of course, one or two team trials, but what is wanted in Scotland is something in the form of a Highland centre, where more events of a kind in which small clubs can participate could be organised. How many provincial clubs numbering short of thirty members can hope to obtain distinction in the way of winning a team prize organised by such powerful institutions as Edinburgh and District Motor Club, Ltd., or either of the Glasgow clubs? The team would probably be called upon to travel a distance at least equal to that covered by some of the English teams competing in Scottish events, and from so small a selection of riders it is impossible generally to pick from the men who are free the right kind of entrant. The keenness is there, and motor cycling as a pastime is increasing enormously in Scotland. There exist among the farmers' sons alone many able and hardy riders who would be keen and ready to participate in club events if such things were possible; but what Scotland undoubtedly lacks more than anything is the necessary element of publicity.

As regards the less isolated motoring bodies in Scotland, each year finds more and more importance attached to the better known events they organise. This year's St. Andrews Speed Test, including the Scottish Speed Championship, was more comprehensive than ever before. For the first time in its history the cream of English trade riders came to advance the standard. The speeds were higher than hitherto. For this the visiting competitors were not entirely responsible, as the championship gave us a Scottish win. There is undoubtedly a great future for the St. Andrews Trials, while, of course, the Highlands will ever stand unrivalled for competition routes.

Light car manufacturers, as well as motor cycle manufacturers, have obtained much valuable experience from the Scottish trials, especially as regards engine cooling and transmission layout. It will perhaps be recalled that on the first day of the recent Scottish Two Days not a single one of the several cars entered, nor even one of the large touring cars carrying the officials, survived a certain portion of the route without boiling, and one can imagine, therefore, that the test was outstandingly severe for air-cooled engines. Not many roads in the British Isles, barring bonnie Scotland, can produce thirty miles of steady collar work, terminating with a Devil's Elbow of the real knock-out variety.

In Scotland the motor cycle affords an even greater adjunct to field sports than in England. Taking the major portion of North Britain, fishing, shooting, and the game the Scotch knock "L" out of, are the outstanding pastimes, and from all these the motor cycle is inseparable. Thus Scottish riders are, as a whole, a very sporting crowd, while the conditions of their country tend to produce efficient riders, apart from the mechanical inclinations characteristic of Northern blood.

Were it not for the great distances which shut many Scottish riders off from the industry or from the centres of general activity, distances invariably backed by questionable weather conditions, the region north of Stirling and Glasgow would produce many more famous motor cyclists than can at present be mustered. Even as things stand, Scotland is extraordinarily well represented by such well-known names as those of the brothers Alexander, Downie brothers, Fairley brothers, George Grinton, Graeme Walker, Alf Lindsay, R. W. Stanfield, the Scott exponent, and R. J. Braid; while as regards Scottish productions, the sleeve-valve Barr & Stroud engine and the rotary valve of the G.R.I. are at any rate worthy of a place in the achievements of the present era.

CONFIDENCE IN THE MIDLANDS.

EVERYTHING points to the coming year being a boom year for motoring, and particularly motor cycling.

In the Midlands 1922 has been a good year for motor cyclists, albeit the weather conditions have not been too kind. The competitions organised by the clubs in the Midland Centre of the A.C.U., which now number close on twenty (including all the principal ones in the Midlands between Shrewsbury on the west, Rugby on the east, Burton on the north, and Kidderminster on the south), have been very well supported.

The sporting spirit has not abated in the least, so far as Midland motor cyclists are concerned, and there is every reason to believe that the open competitions organised by the Midland Centre, as well as those of the individual clubs in the centre thrown open to other clubs, will be even better supported in 1923.

R. Vernon C. Brook, O.B.E., A.M.I.E.E., M.I.A.E., Chairman of the Midland Centre A.C.U., expresses the Midland view.

The falling prices of motor cycles, and the already much reduced cost of petrol, tyres, etc., together with an improvement in trade, lead one to believe that there will be a much bigger demand for motor cycles than there has been since 1919, especially as so many ultra-simple machines are being introduced. Midland factories are all preparing big programmes, and the perfecting of the 350 c.c. machine for solo work and the 500-800 c.c. types for sidecar duties brings motor cycles within the reach of many who could not previously afford to take them up.

The power-assisted pedal cycle, too, will doubtless claim numerous adherents, many of whom will in time become fully fledged motor cyclists. Motor cycling is one of the most exhilarating and health-giving pastimes; at the same time it is of an educative value. Also, it is not nearly so expensive to follow as many sports which offer far fewer benefits.

The Outlook.—

Motor cycling in this country, unlike many foreign countries, is indulged in by men and women belonging to every class of the community, and no doubt we shall see many more women motor cyclists in the future.

The modern motor cycle requires a minimum of attention. It is reliable in use, and as safe as a pedal cycle if ridden with an ordinary amount of care. Motor cycle accidents do occur, but actually the number is small compared with the number of machines in use. The prospective motor cyclist has nothing to fear as regards his safety, for there is no more reliable piece of mechanism than the modern motor cycle.

My message to the would-be but hesitant motor cyclists is :—

"Buy your motor cycle now, whilst prices are low. Do not hesitate to obtain your mount for next year, and take advantage of the many fine days we shall have between now and next summer to enjoy the glories of the open road."

To those who are already motor cyclists, I say :—"Combine ; join some motor organisation : the Auto Cycle Union, the local motor cycle club, or the A.A., and help to bring about reasonable and less inequitable legislation for motorists generally, so that the pleasures of motoring may be pure, unadulterated, and unalloyed pleasure from start to finish."

OBSERVATIONS FROM THE NORTH-WEST.

T. R. Rutherford, Consul for the Northern Centre A.C.U., who sends observations from Cumberland and Westmorland.

MOTOR cycling in the A.C.U. Northern Centre embraces the area extending from Carlisle to Barrow-in-Furness, taking in Lancaster and Alston, on the southern and eastern boundaries.

A look at the map and the contour of the country generally will quickly reveal that we motor cyclists in this area are exceedingly fortunate in our training ground, and to-day we are prepared to take on and challenge to a reliability test any other centre with, say, a dozen riders. By that we do not mean the selection of a course which requires a mount representing something between a motor bicycle and a submarine, but just a plain, honest, sporting course such as we delight in in this area when we go out with our pillion passengers for an afternoon's outing!

We have in our area a big number of riders totally unknown to fame, and I judge it is only modesty which has, up to now, kept them from being read about. I have seen some of these modest people on Wrynose, Blae Tarn, Honister, Hard Knott, and numberless more "stunt" hills which at the moment I am not disclosing, and the way our boys stick to their machines can only be likened to a squirrel sticking to a tree in a storm. If the bit of timber does come down, as sometimes happens, you will always find Mr. Squirrel somewhere with his tail up!

The Cumberland County Motor Cycling Club is admittedly the premier club of the centre, but can by no means boast of a monopoly of the sporting talent. The Westmorland men can always produce some of the finest reliability riders in the country. The same applies equally to Workington or the western section of the C.C.M.C.C. Then, again, we have the Barrow, Lancaster and Alston Clubs, which brave the worst of elements to take part in what they term "a bit of an outing."

We are all anxious to see the English Six Days Trials coming to our area for 1923, because we are convinced that the more southern latitudes are not geographically suited for carrying out valuable tests of the modern motor cycle. Furthermore, in the comparatively thickly populated Home Counties and Midlands trials must always be encroaching, metaphorically speaking, on somebody's back garden. And, pray tell me, where is a better testing ground than the Lake District?

Not long ago I saw a report in which a rider claimed to have made the first ascent of Skiddaw. As a matter of fact, it is years since this little pimple was vanquished by our local motor cyclists. Even a little single-geared 240 c.c. O.K. accomplished the feat entirely unaided as far back as 1913. This was done by the late George S. Rutherford, and previously the ascent had been made by T. B. Westmoreland, R. Drinkall, C. B. Little, and R. Braithwaite—all on single-geared machines. To-day, with our up-to-date mounts, we would hardly think it worth while wasting time on what we now regard as a merely picnicking jaunt. Even the mighty Helvellyn has been conquered by some of our local riders.

However, we are getting along wonderfully, even on our half-throttle method. One day we may come to open out and be a little less shy.

OPTIMISM IN YORKSHIRE.

IT is somewhat early to indicate the prospects for 1923 in Yorkshire, but the dawn of the New Year will at least find the usual optimism prevailing. A splendid standard of efficiency was achieved during 1922, and organisers will have to go "all out" to improve upon past successes.

I prefer, however, to comment on the events of this year in the hope that many motor cyclists who are not members will become interested and join the various clubs, and so help to make them more successful than before.

In 1921 I missed only one important Yorkshire Trial (Saltburn), and during the 1922 season I was present at every one in some official capacity (from A.C.U. steward down to "chief puller out" at water-splashes), so perhaps I am qualified to pass an

The Outlook.—

opinion. Good fellowship and good sportsmanship are prevailing features of all Yorkshire events, and successes are achieved by whole-hearted co-operation of all concerned.

The Open Reliability Trial, held in June, was organised on new lines, *i.e.*, ten classes, with a silver cup the premier award in each and with smaller cups for second and third (all won outright). A feature of this trial was that the organisers (the Centre Board) announced the complete results the same day, and immediately afterwards sent a complete printed schedule of results to all entrants, competitors, and helpers.

The York Club made its annual success of Sutton Bank, and this would have been more pronounced but for a week's postponement due to bad weather. Staxton (the Scarborough Club's Easter event) was well supported and organised, and witnessed by a big crowd. Complete with brass band, the Bradford M.C. and L.C.C. attracted a big crowd of riders and spectators to the "freak hill" (Rosedale Abbey), where Capt. Fraser Nash made two thrillingly fast ascents. The Sheffield and Hallamshire Club's Centre Event was marred by pouring rain. The organisation was splendid, the course being roped from end to end, and the system of telephones used between the starting and finishing lines was the finest I ever saw.

The Middlesbrough Club has a magnificent playground on Saltburn Sands, and some splendidly organised races were provided. Doncaster's "Petrol St. Leger" (alongside the famous racecourse) was very well organised and very well supported. Backed by a very progressive Townsmen's Association, the Scarborough Club took advantage of its good fortune in a perfect day, and a course flanked on one side by the sea and on the other by cliffs which formed a grand stand for the largest and most orderly crowd I ever saw at a motor cycle event in Yorkshire. The "setting," like the whole event, was great. The re-formed Bridlington Club also "ran" speed trials which were very successfully organised.

Alex. Dovener, Hon. Sec. of the Yorkshire Centre A.C.U. and the Bradford M.C. and L.C.C., who here attributes the success of Yorkshire clubs to the good fellowship and sportsmanship of their members.

The Harrogate Club made a huge success of the Centre Team Trial for the "Haggas" Shield. The Ilkley Club introduced a novel idea of "bogey" timing on hills in its Centre Reliability Trial. This event was not well supported, but I think the lateness of the season was partly accountable. Of a different type was the 24 Hours' Trial organised by the Bradford M.C. and L.C.C. in July, to London and back, which secured 82 competitors for five trophies, four of which were won outright. Invitations to join in were accepted by Dewsbury, Wakefield, Leeds and District, and Hull Motor Clubs, so that altogether well over 100 riders took part.

All the above-mentioned clubs have had their own successful speed and reliability events, as have also the following: Wombwell, Goldthorpe and Thurnscoe, Hull Auto Cycle, Keighley, Darlington, and Leeds University. The Bradford Gipsy Motor Cycle and Car Club has had a very successful season indeed, catering well for the "social" rider, as has also the Leeds Motor Union. Affiliated clubs are also to be found in Barnsley, Mexborough, Rotherham, Ripon, Stocksbridge, and Wath-on-Dearne, though, unfortunately, these clubs do not actively support the Centre. Unaffiliated clubs are in existence at Skipton, Pontefract, Halifax, Shepley (near Huddersfield), and Knaresborough, whilst there is also another club in Sheffield. The Board of the Centre, I know, looks forward to the time when all the Yorkshire clubs are banded together for the good of motor cycling generally and clean, good sportsmanship.

WEST COUNTRY ENTHUSIASM.

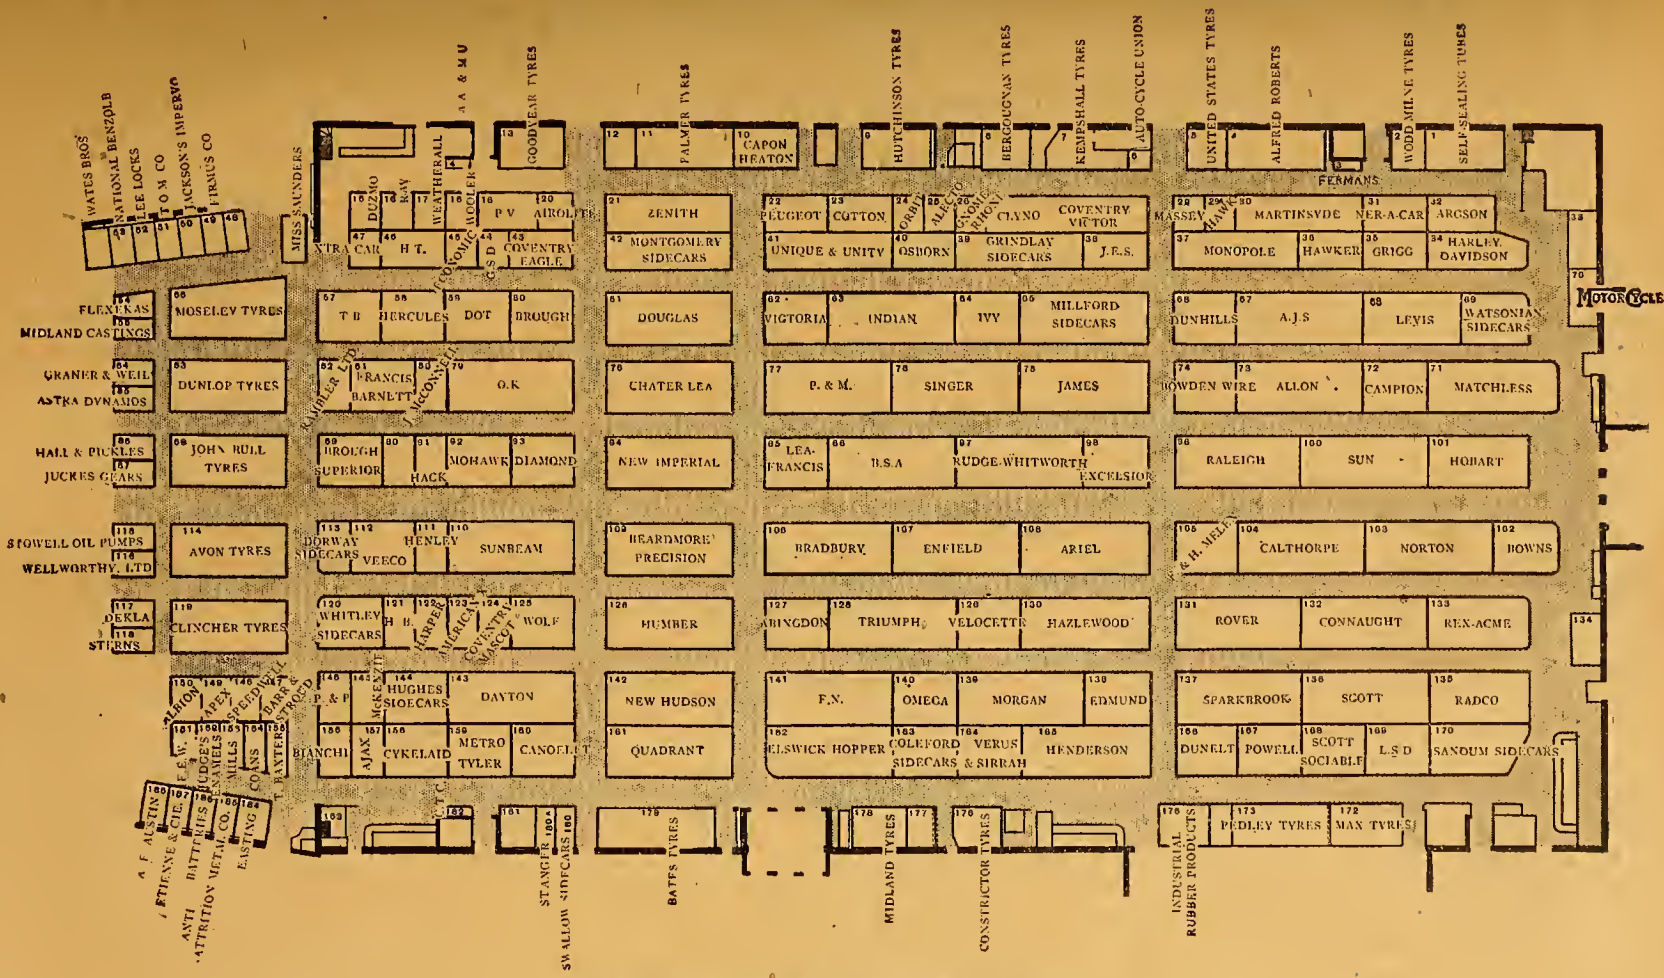
"JOIE de vivre" (according to an official of the Wessex Centre A.C.U.) aptly expresses the feeling of motor cyclists in the West. For 1923 a still more rosy future is predicted, with a general reduction of costs all round, a new A.C.U. Centre (Wessex), complete unity, co-operation and harmony. What more can the followers or members of club organisations of the cities of Bath, Bristol, Gloucester, and Wells and the many towns of Wessex desire. Hope is shown all around; enthusiasm abounds. Even the old "have-beens" are re-appearing; great vows are being registered, and mighty schemes are in the embryonic state.

The past has been good, but the future will be better. All clubs have been very active on the social and sporting side, and still greater activity is foreshadowed in every way. It is even whispered that there will spring into being a general Country Club House, where all creature comforts will be supplied in addition to the provision of every facility for the votaries of tennis, golf, fishing, boating, music, dancing, etc.

Optimism is the key-word of the West, and rightly should it be so. The strength of twenty clubs totalling nearly 1,200 members is calculated to make the most confirmed pessimist pause for reflection upon the ever-extending growth of the motor cycle movement.

For the seekers after trophies of silver and discs of gold, silver, and even of bronze, varied programmes are in course of formation. The freak hill climber, speedman on flat and hill, gymkhana devotee, night rider, and those desirous of pitting their strength against the wintry elements, all will be catered for. The right men for the right place have been found, and with such organisers and promoters as are in the clubs of Avalon (Wells City), Bath, Southwick, Bristol, Kingswood, Swindon, Devizes, Marlborough, Yeovil, Barnstaple, Taunton, and Exeter, success is bound to reward the efforts which will be put forward and maintained throughout the coming year.

A GUIDE TO THE EXHIBITS AT OLYMPIA.



Plan of Stands in the Main Hall.

AN ALPHABETICAL LIST OF EXHIBITORS AT THE 1922 SHOW.

	Stand No.
Abingdon Works, Ltd.	127/284
Accles and Pollock, Ltd.	196
Ajax Motor Mfrs., Ltd.	157
Albion Eng. Co., Ltd.	150
Alfred Appleby Chain Co., Ltd.	237
Alldays and Onions, Ltd.	73
Allen Liversidge, Ltd.	240
Amac, Ltd.	204
Anti Attrition Metal Co., Ltd.	185
Apex Inflator Co., Ltd.	149
Argson Eng. Co., Ltd.	32
Ariel Works, Ltd.	106
Armstrong Cycles, Ltd.	90
Ashby, Frank and Co.	305
Astra Dynamo Co.	85
Atkey, A. R., and Co., Ltd.	282
Auster, Ltd.	274
Austin, A. T.	188
Automobile Assn. and Motor Union	14
Auto Cycle Union	6
Avon India Rubber Co., Ltd.	114
Baker, F. E., Ltd.	109
Barr and Stroud, Ltd.	147
Bates, W. and A., Ltd.	179
Batteries, Ltd.	186
Baxter, T.	155

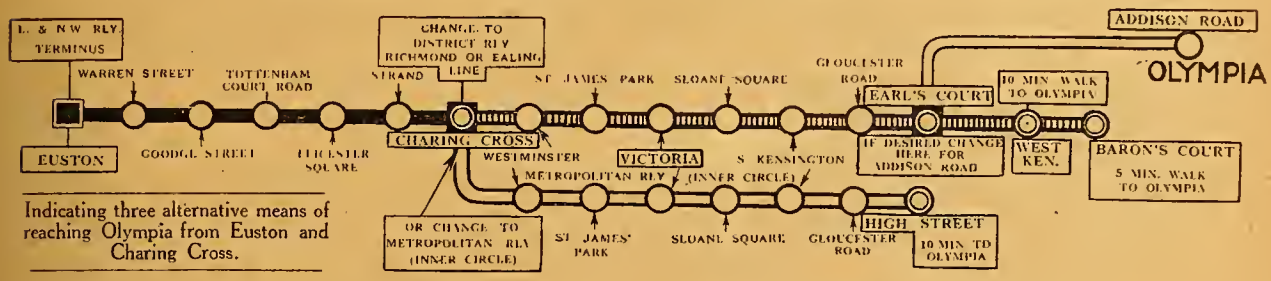
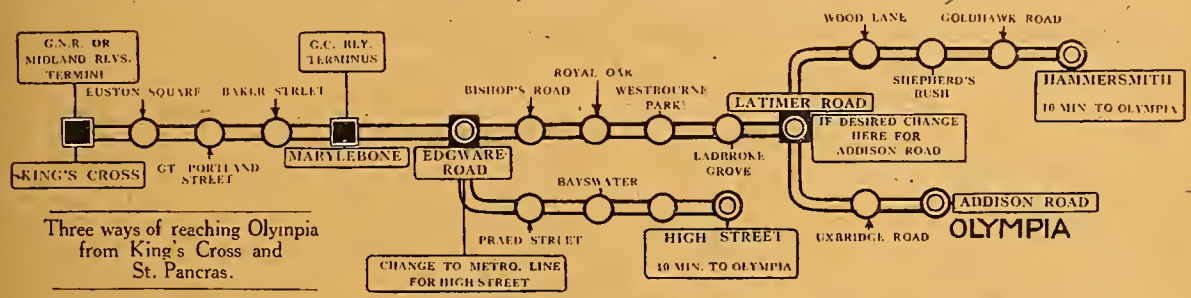
TRAIN AND BUS ROUTES TO THE SHOW.

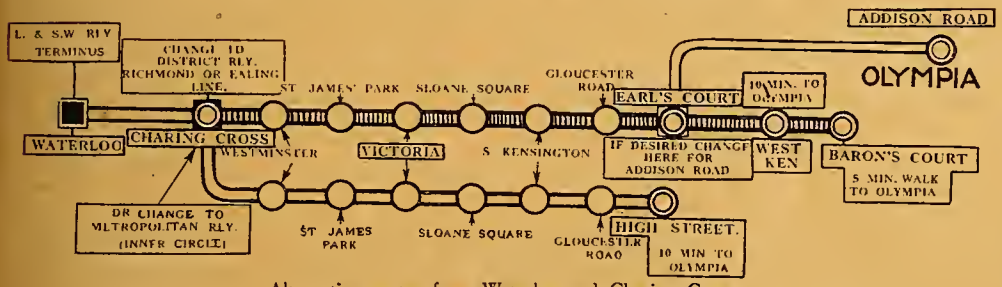
Connections Between Main Line Termini and Underground Train Services.



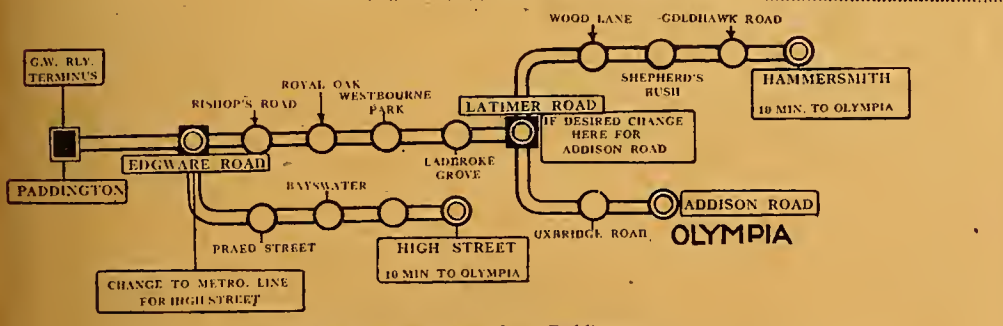
Indicating three alternative means of reaching Olympia from Euston and Charing Cross.



Three ways of reaching Olympia from King's Cross and St. Pancras.



Alternative routes from Waterloo and Charing Cross.



Showing quickest routes from Paddington.

OTHER TRAIN ROUTES.

FENCHURCH STREET (L.T. & S. & G.E. Rys.). By District Railway (Mark Lane Station) via Charing Cross, then proceed as shown in first plan.

LIVERPOOL STREET (G.E. Ry.). Central London Railway to Shepherd's Bush, changing there to motor 'bus Nos. 49, 49a.

VICTORIA (L.B. & S.C. & S.E. & C. Rys.) By District Railway to Addison Road, changing at Earl's Court, or on Inner Circle train to High Street Kensington, or on Richmond or Ealing train to Baron's Court.

LONDON BRIDGE (L.B. & S.C. & S.E. & C. Rys.). By District Railways from Monument Station to Addison Road, changing at Earl's Court, or on Inner Circle train to High Street Kensington, or on Richmond or Ealing train to Baron's Court.

(Note: Addison Road Station is not so frequently served from Earl's Court as Baron's Court.)

'BUS ROUTES TO OLYMPIA.

By those who prefer to travel all the way to Olympia by motor 'bus, the following particulars of the services available should be studied :—

BAKER STREET (Metropolitan Ry.). 'Bus service Nos. 27, 27b, 27c.
BROAD STREET (L. & N.W. Ry.). No. 9.
CANNON STREET (S.E. & C. Ry.). No. 13 to Piccadilly Circus, thence by No. 9 or No. 33.
CHARING CROSS (S.E. & C. Ry.). No. 9 or No. 33.
EUSTON (L. & N.W. Ry.). No. 73.
FENCHURCH STREET (L.T. & S. & G.E. Rys.). No. 23 to Oxford Circus, then by No. 73.
KING'S CROSS (G.N. Ry.). No. 73.
LIVERPOOL STREET (G.E. Ry.). No. 9.
LONDON BRIDGE (L.B. & S.C. & S.E. & C. Rys.). No. 13 to Piccadilly Circus, thence by No. 9 or No. 33.
MARYLEBONE (G.C. Ry.). Nos. 27, 27b., 27c.
PADDINGTON (G.W. Ry.). Nos. 27, 27b, 27c.
ST. PANCRAS (M. Ry.). No. 73.
ST. PAUL'S (S.E. & C. Ry.). No. 9 from Ludgate Circus.
VICTORIA (L.B. & S.C. & S.E. & C. Rys.). Nos. 16, 25, 25a, 25b, 38, 38b, to Hyde Park Corner, then by Nos. 9, 33, or 73.
WATERLOO (L. & S.W. Ry.). Nos. 1, 48, 67, or 68 to Strand, thence by Nos. 9 or 33.
HOUNSLOW, 27b.
LEWISNAM. Motor 'bus No. 49a runs to Shepherd's Bush *via* Holland Road, serving also Catford, Forest Hill, Upper Sydenham, Crystal Palace, Beulah Hill, Streatham Common, Tooting Bec Road, Trinity Road, Northcote Road, Falcon Road, Battersea Bridge.

Forecast and Guide to OLYMPIA

An Advance Review of the Motor Cycles at the Exhibition Opening on Saturday next. A Stand-to-Stand Forecast of the Exhibits so arranged as to form a Guide to the Show.

In addition to the forecast of 1923 models contained in this issue, "The Motor Cycle" for several weeks past has contained detailed descriptions of new machines. The issues in which these appeared were as follows:

Alecto	Nov. 16	Chater-Lea	Nov. 16	Grigg	Nov. 2	Martinsyde	Nov. 16	Quadrant	Oct. 5
American X.	Nov. 16	Calthorpe	Nov. 16	G.S.D.	Oct. 12	Metro-Tyler	Nov. 16	Rudge	Nov. 16
Ariel	Nov. 9	Coventry Mascot.	Nov. 16	Harley-Davidson.	Nov. 16	Matchless	Sept. 21	Radco	Nov. 16
A.J.S.	Nov. 2	Croft	Nov. 2	Henderson, U.S.A.	Nov. 16	and	Nov. 16	Raleigh	Sept. 28
Allon	Oct. 26	Connaught	Oct. 26	Hawker	Nov. 16	New Imperial	Nov. 9	Sheffield-	
Bianchi	Nov. 16	Campion	Sept. 28	Hazlewood	Nov. 9	and	Nov. 16	Henderson	Nov. 16
Bradbury	Nov. 16	Cedos	Sept. 28	Hagg	Nov. 9	Norton	Nov. 2	Sunbeam	Nov. 2
Beardmore-		Douglas	Nov. 16	Humber	Oct. 12	Ner-a-car	Nov. 2	Sirrah and Verus	Oct. 26
Precision	Nov. 9	Dot	Nov. 16	Henley	Sept. 21	New Hudson	Oct. 26	Triumph	Nov. 9
B.S.A.	Oct. 26	Duzmo	Nov. 16	Ivy	Nov. 9	Orbit	Nov. 16	and	Nov. 16
Brough-Superior	Sept. 28	Dunelt	Oct. 26	James	Nov. 16	O.K.	Nov. 2	Triple H.	Oct. 12
Brough	Sept. 28	Dorway Sidecar	Oct. 19	J.E.S.	Nov. 9	Omega	Oct. 19	Velocette	Nov. 2
Cykelaid	Nov. 16	Economic	Nov. 2	J.D.	Sept. 28	P.V.	Nov. 16	Wolf	Oct. 26
Clement	Nov. 16	Edmund	Oct. 19	Kenilworth	Nov. 16	Powell	Nov. 16	Wooler	Sept. 21

Stand **DUZMO.**

15. When the Duzmo was introduced to the public there were comparatively few sports models on the market, and it occupied quite an important niche in the motor cycle world. To-day it is uncommon to find any make of motor cycle that is not available in some kind of sporting form, but this does not lessen the appeal of a machine the primary aim of which is to attract the youthful enthusiast.

A 496 c.c. o.h.v. engine and a close ratio Sturmey gear box are the most important items of the standard specification; reversing usual practice, a wide ratio box is supplied optionally for passenger work. Clearance for the overhead valve gear is helped by the inclined setting of the engine, one of the distinctive features of the design.

Stand **RAY.**

16. Nottingham is rapidly becoming an important centre in the motor cycle industry, and one of the comparatively few absolutely new makes at the Show hails from that city. Manufactured by the firm of W. H. Raven and Co., Ltd., the machine referred to is a well-designed miniature with a 198 c.c. four-stroke engine and two-speed gear box and clutch in one unit. Final transmission is by chain, and generally the detail work is carried out in exemplary fashion for so small a machine. A flywheel magneto is used, and no difficulty is experienced with the superfluous spark on the exhaust stroke.

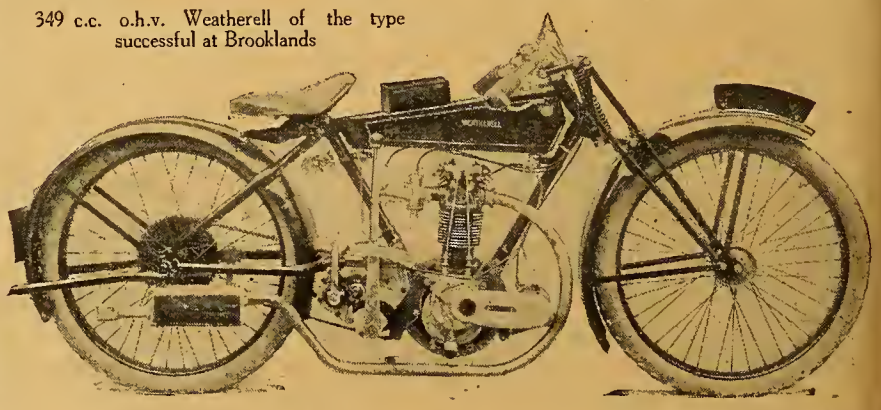
Stand **WEATHERELL.**

17. Consistently good performances on Brooklands track have done much to bring Weatherell motor cycles before the public eye. Perhaps this make's biggest success was to win the 100 miles Giant Handicap this year, but it has given a good account of itself at every meeting during 1922.

Three main models will constitute the 1923 range, all being fitted with Blackburne engines (250 c.c., 350 c.c., and 696 c.c.). Side valve or o.h.v. editions of each will be available.

Perhaps the most interesting machine is the smallest, which has a fully triangulated frame of neat design,

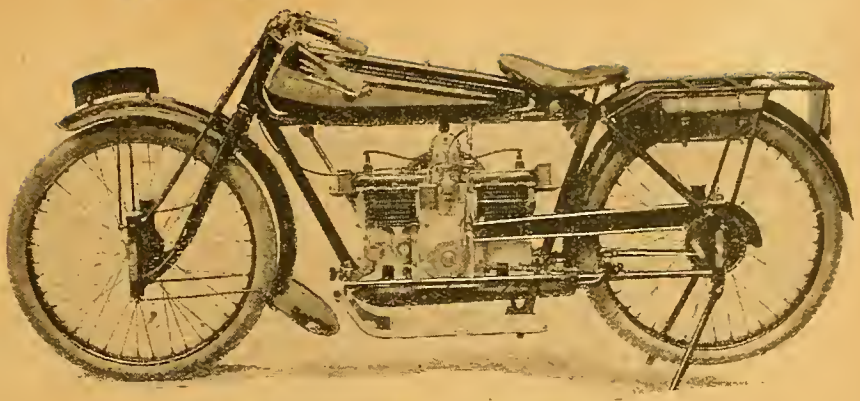
349 c.c. o.h.v. Weatherell of the type successful at Brooklands



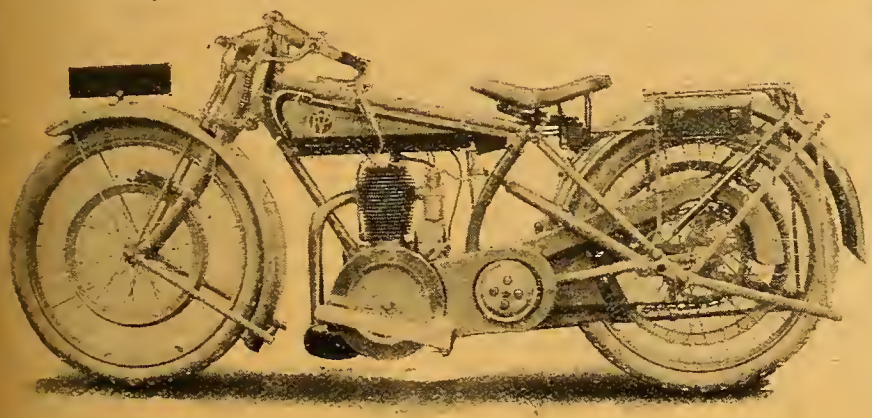
Forecast and Guide to Olympia.—

Stand **WOOLER.**

18. Although beset in the past by various difficulties, the makers of the Wooler have never adopted the line of least resistance to a motor cycle manufacturer and marketed an assembled machine embodying proprietary components. Their 1923 models supply ample justification for their attitude, the designs being full of practical originalities. Flat twin engines are exclusively fitted. The chief types shown will be 350 c.c. and 500 c.c. touring models and a 350 c.c. sports model with an unusual form of semi-overhead valve gear. The larger Wooler is intended for sidecar work. Chain transmission from a gear-driven gear box in the crank case is employed on the three-speed models.



350 c.c. sporting Wooler, which has a re-designed high efficiency engine.



Sleeve-valve Barr and Stroud-engined P.V. spring frame machine.

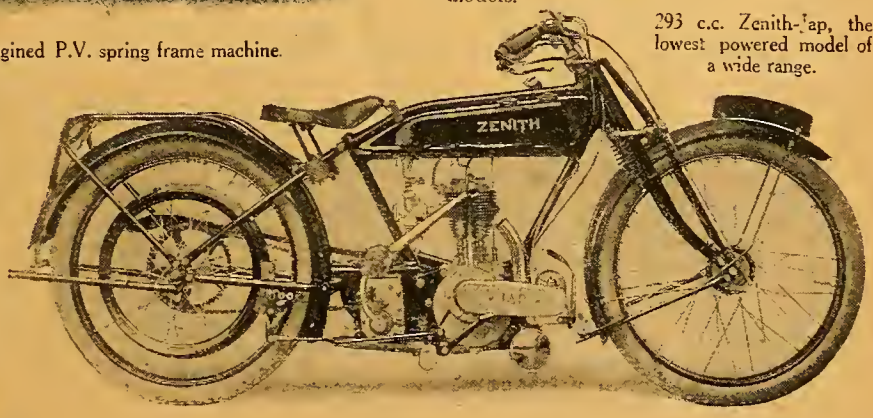
Stand **P.V.**

19. Comfort is naturally the slogan of the manufacturers of the P.V. For many years now a simple spring frame has given every satisfaction to riders of this machine, and the very choice of engines fitted to the various models has obviously been based with the idea of gaining smooth running and even torque. Only the smaller sizes are single-cylinders (250 c.c. Villiers, 350 c.c. Villiers, 293 c.c. J.A.P., or 350 c.c. Barr and Stroud), the larger sports solo or dual-purpose machines being fitted with 496 c.c. and 654 c.c. J.A.P. V-twins. With the super-sports type of smaller twin engine the P.V. presents a very attractive combination of liveliness and luxury.

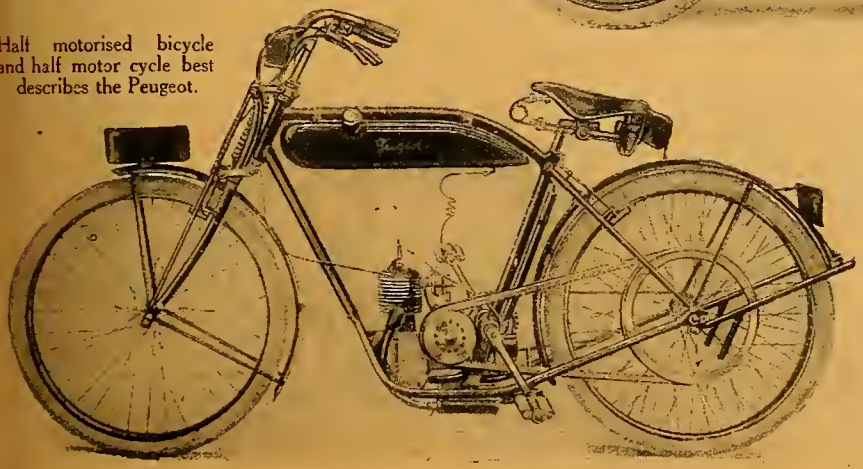
Stand **ZENITH.**

21. 100 m.p.h. records by Le Vack have done much to impress the name Zenith on the average motor cyclist's mind, but in case of pre-war riders there is little necessity, for the Zenith and its Gradua gear attained much fame in the days when 60 m.p.h. was marvelled at. With the decline in popularity of the belt drive the firm has gradually increased its range of chain-driven models, which now comprise 976 c.c. J.A.P., 496 c.c. oil-cooled flat twin Bradshaw, 348 c.c. J.A.P., and 293 c.c. J.A.P. engined models.

293 c.c. Zenith-Jap, the lowest powered model of a wide range.



Half motorised bicycle and half motor cycle best describes the Peugeot.



Only the 656 c.c. Gradua-geared touring model will remain on exhibit, but the equivalent sports machine and its larger edition will still be marketed.

Stand **PEUGEOT.**

22. Miniatures on the border-line of the motorised bicycle will be shown by the famous French firm of Peugeot. First exhibited at the Paris Salon, the machine employs a proprietary French two-stroke engine specially designed for its purpose and a two-speed gear, final drive being by belt over large pulleys. Proper girder-type spring forks and a sloping top tube (on the standard model) follow motor cycle practice, but a good deal of the specification and the general appearance are distinctly reminiscent of the pedal cycle.

Forecast and Guide to Olympia.—

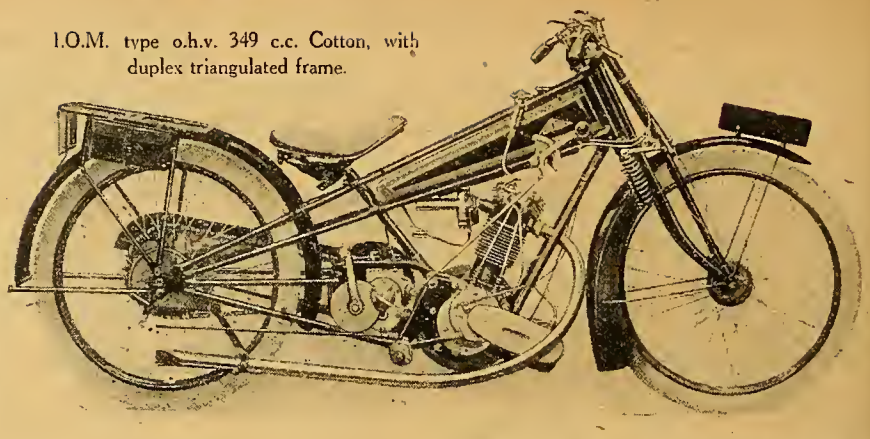
Stand **COTTON.**

23. In this year's Junior T.T. race the Cotton demonstrated what thinking motor cyclists must have realised for many years—that its triangulated frame and low centre of gravity possess distinct advantages over more conventional designs in road-holding and cornering abilities.

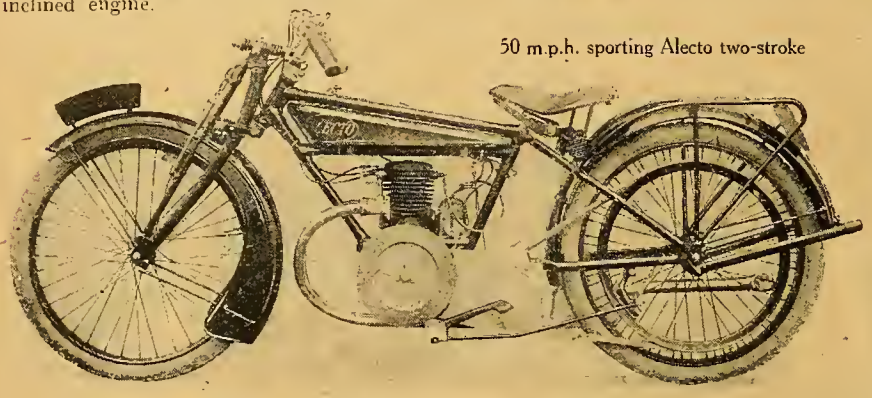
250 c.c. and 350 c.c. Blackburne engines (in the second case, side-valve or o.h.v.) are fitted to the main models, final chain drive being incorporated in the larger model. A 250 c.c. Villiers engine may be substituted for the 250 c.c. Blackburne at a saving of some £10.

Silencing arrangements and fork construction have been improved for 1923; and naturally the o.h.v. model follows the lines of the I.O.M. machine in having an inclined engine.

I.O.M. type o.h.v. 349 c.c. Cotton, with duplex triangulated frame.



50 m.p.h. sporting Alecto two-stroke



Stand **ORBIT.**

24. Every one of the four Orbit models on show, although all between 250 c.c. and 350 c.c., will be fitted with a different type of engine. These are 265 c.c. Orbit two-stroke, 349 c.c. Barr and Stroud sleeve-valve four-stroke, 349 c.c. o.h.v. Blackburne four-stroke, and 349 c.c. oil-cooled Bradshaw four-stroke. The same frame takes all these units, and the general specification—Burman three-speed gear box, chain drive, etc., is identical.

Stand **ALECTO.**

25. For some years now the makers of the Alecto have specialised in the evolution of the 350 c.c. two-stroke, with the result that the 1923 edition of this make in a sports form is said to be capable of 50 m.p.h. as delivered.

The latest Alecto engine is 346 c.c. (76×76 mm.), and is chiefly notable for the very complete system of oil ways provided to ensure adequate lubrication of every working part.

Various forms of transmission, with two- or three-speed Burman gear boxes, will be used on the models shown, and several detail improvements have been effected to the cycle parts.

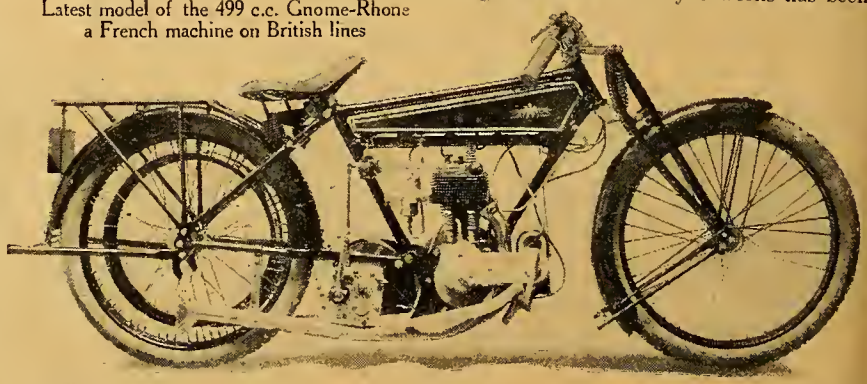
Stand **GNOME-RHONE.**

26. Designed by an Englishman, the Gnome-Rhone is built in France by a famous aircraft firm. It has a straightforwardly laid-out four-stroke engine of 499 c.c. (85×88 mm.), which drives to a Sturmey-Archer three-speed gear box and thence to the rear wheel by belt.

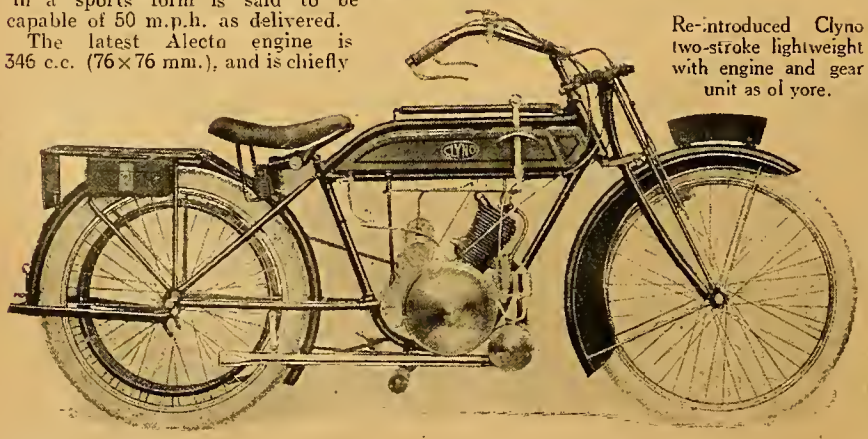
Stand **CLYNO.**

27. Since last Show a complete reorganisation of the Clyno works has been

Latest model of the 499 c.c. Gnome-Rhone a French machine on British lines



Re-introduced Clyno two-stroke lightweight with engine and gear unit as of yore.



made, and models of the 925 c.c. spring-frame sidecar outfit and 269 c.c. two-stroke will appear, embodying several improvements. The passenger model, by reason of its luxurious specification, is not far from the top of its class, and it has not been found necessary to modify it to any great degree. A steel and phosphor-bronze plate clutch has, however, been substituted for the cork insert type previously used.

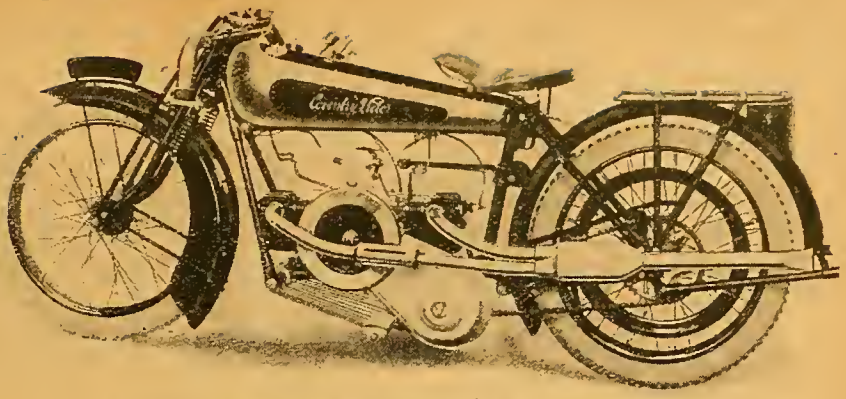
Outwardly the lightweight also remains unchanged, which is not surprising in view of the satisfactory service which it has given to owners since its inception some years ago. It will be recalled that the engine and two-speed gear are combined in one unit of the very simplest nature. Final belt drive and "petroil" lubrication are two features that give a keynote to the whole scheme of the design.

Forecast and Guide to Olympia—

Stand **COVENTRY VICTOR.**

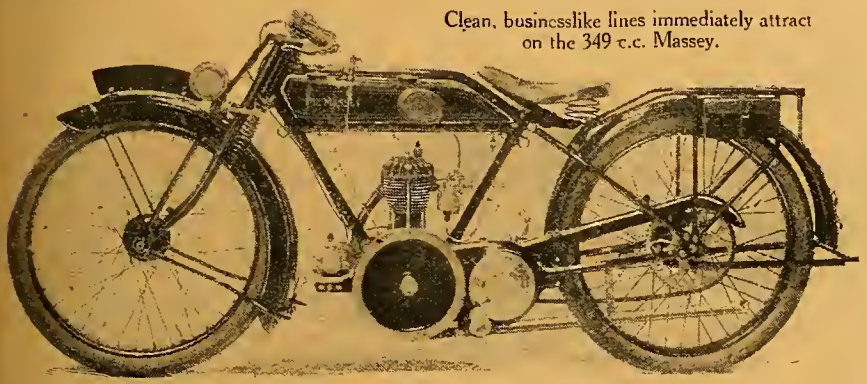
28. Since it won its class in the 500 mile race in 1921 the 688 c.c. flat twin Coventry Victor has steadily gained favour with the speedman; and realising this the makers have introduced a super-sports model for next year. Although the specification is in every way suitable for a touring machine, the new model will be supplied with an 80 m.p.h. speed guarantee at a slight extra charge. Two Cox Atmos carburetters supply the mixture to the cylinders, and a system of balanced air-pressures in float-chambers, fuel tank, and induction pipe has been adopted.

Ordinary sporting and touring (solo or sidecar) models are, of course, retained, chain drive *via* a Sturmey gear box being common to all.



80 m.p.h. is the guaranteed speed of the "Super-Six" Coventry Victor.

Clean, businesslike lines immediately attract on the 349 c.c. Massey.



Stand **MASSEY.**

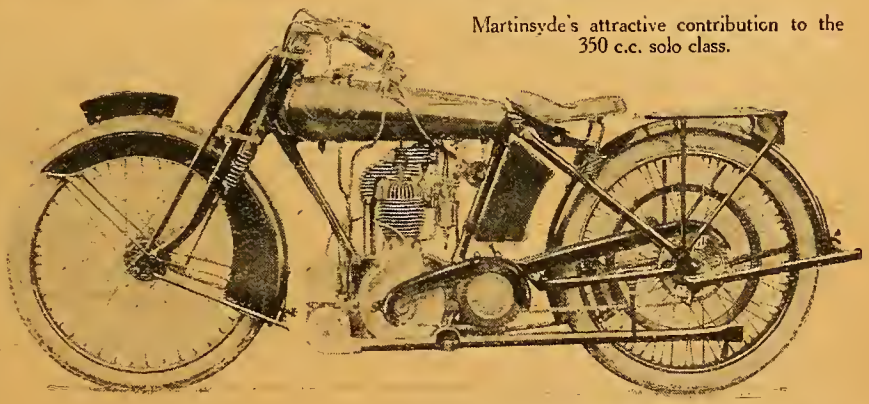
29. One of the neatest machines to make its appearance this year is the Massey. (It was introduced to the public in July.) Proprietary units are used, Blackburne engines being fitted throughout, but the appearance of the whole machine, besides being extremely pleasing, indicates that considerable thought has been expended on the design. Details of frame construction are particularly well carried out. For example, the steering head has very large ball races with special lubricators; the handle-bars are celluloid-covered, and an auxiliary bar is provided for carrying instruments, etc. The bottom bracket lug is also a good example of light but sturdy design. Excellent mudguarding, internal expanding brakes, and chain drive (neatly enclosed on its primary portion) are features of all Massey machines.

Stand **MARTINSYDE.**

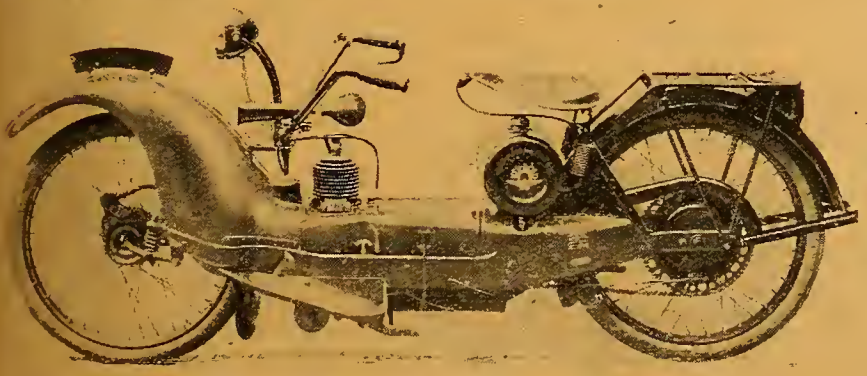
30. In company with a great many others, the manufacturers of the Martinsyde have introduced a 350 c.c. single for next year; however, they differ from most firms by designing an entirely new model instead of employing a proprietary engine or adapting one of their existing designs to meet the new requirement.

The latest Martinsyde follows the bigger twins in having an overhead exhaust valve, but the valve gear is novel and, it is claimed, silent. The valve rocker pivots on an inverted knife edge, and an external leaf spring replaces the conventional coil.

Martinsyde's attractive contribution to the 350 c.c. solo class.



Little change has been made to the 678 c.c. standard and sporting models.



Improved mudguard construction is a 1923 Ner-a-car improvement.

Stand **NER-A-CAR.**

31. When the Ner-a-car was first introduced its sponsors would not admit that it was a motor cycle at all. Perhaps it is not; but, nevertheless, it finds its way into the Motor Cycle Show and appeals to quite a number of motor cyclists, as well as to the car-owner or non-motorist *clientèle* which it was designed to attract. Its general lines are now too well known to need detailed description; suffice it to say that it is extremely low built, and almost self-steering and non-skidding. For 1923 its two-stroke power unit has been increased in capacity from 211 c.c. to 285 c.c.

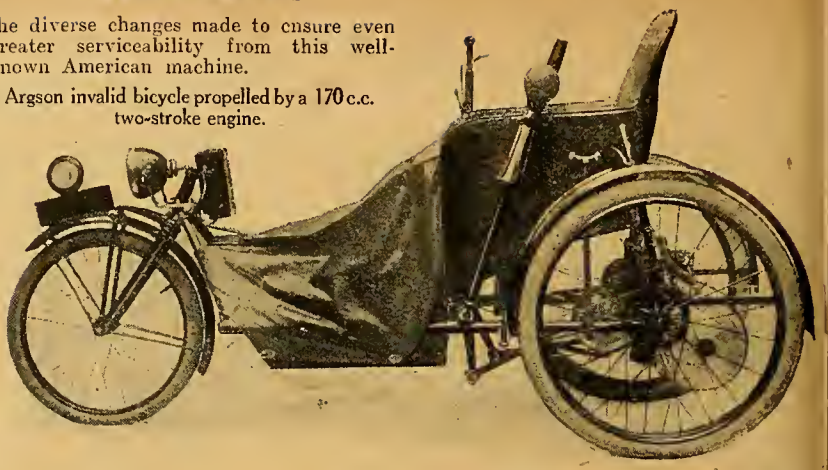
Forecast and Guide to Olympia.—

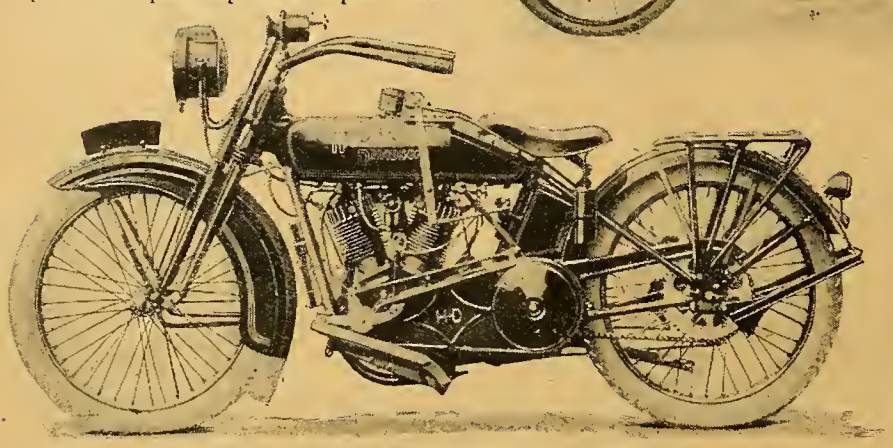
Stand **ARGSON.**

32. Argson invalid tricycles will occupy very much the same position in the motor cycle show as did the Dunkley motor perambulators at the car exhibitions.

Normally they do not interest the motor cyclist except as curiosities, but they are a great boon to the many helpless sufferers left us by the war, and therefore fill an important gap in the world of wheels. The tricycle itself is on the lines of the hand-propelled vehicle bearing the same name, but a well-designed 170 c.c. two-stroke engine of the firm's own construction supplies the power for speeds up to 25 m.p.h. The diverse changes made to ensure even greater serviceability from this well-known American machine.

Argson invalid bicycle propelled by a 170 c.c. two-stroke engine.





989 c.c. Harley-Davidson with gas-lighting equipment in lieu of a dynamo.

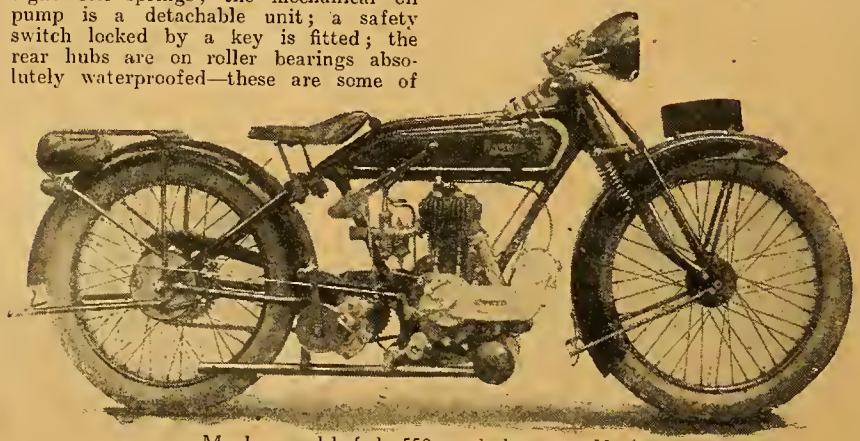
controls are of the simplest nature, a Mills single-lever carburetter and a fixed ignition Villiers flywheel magneto being used.

Separate engine units suitable for miniature motor cycles will also be shown.

Stand **HARLEY-DAVIDSON.**

34. Perhaps the most interesting item to the average man who visits the Harley-Davidson stand will be the new 1,208 c.c. model. But this is not really a new machine—it has long been common in the U.S.A.—and the detail improvements to existing models deserve just as close attention.

The front forks now carry no less than eight coil springs; the mechanical oil pump is a detachable unit; a safety switch locked by a key is fitted; the rear hubs are on roller bearings absolutely waterproofed—these are some of



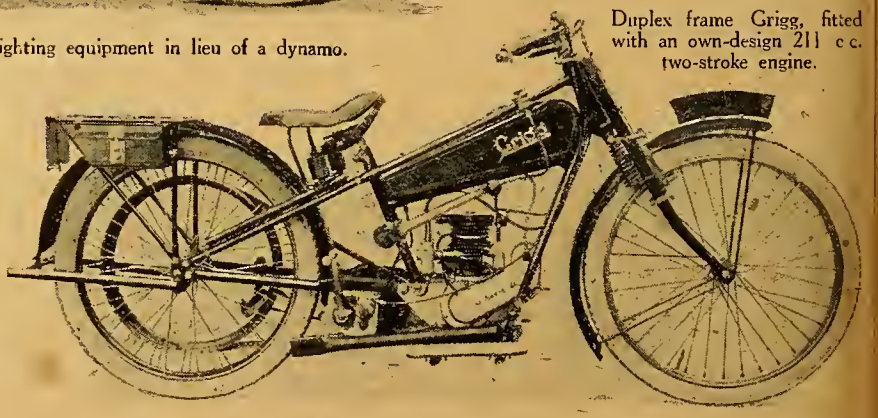
Magdyno model of the 550 c.c. dual purpose Hawker.

The three main models are: 584 c.c. flat twin, 989 c.c. V-twin, and 1,208 c.c. V-twin; attached to the last-mentioned will be shown an imposing double-seater sidecar.

Stand **GRIGG.**

35. Grigg lightweights are considerably more attractive than their name. Three models will comprise the 1923 programme: (1) a duplex frame machine with a 347 c.c. Villiers engine, (2) a similar model with a 211 c.c. Grigg two-stroke engine, and (3) an o.h.v. four-stroke 181 c.c. miniature. Two-speed Sturmey gear

Duplex frame Grigg, fitted with an own-design 211 c.c. two-stroke engine.

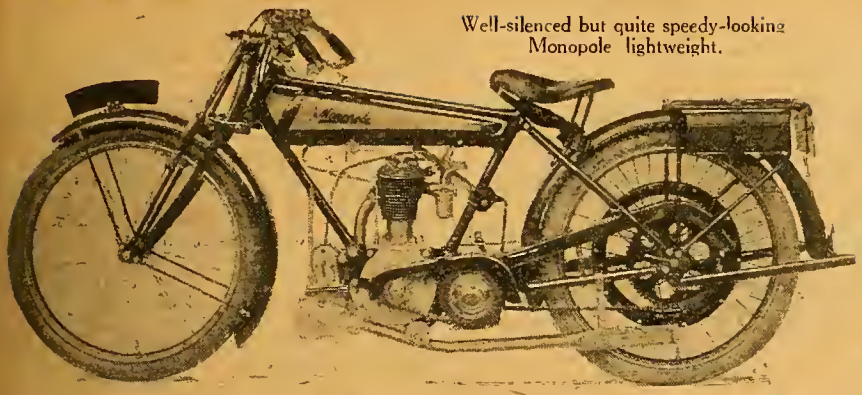


boxes are fitted in the first two cases, a two-speed Chater-Lea box on the miniature and a three-speed Sturmey box on a sidecar edition of the largest machine.

Stand **HAWKER.**

36. Frame improvements in the Hawker tend to render it more conventional in appearance than hitherto. A dropped top tube allows a lower saddle position with a considerable gain in ease of steering. This applies particularly to the larger model, which uses a 550 c.c. Blackburne engine, a Burman three-speed gear box, and equally well-known proprietary units for carburation, ignition, etc. Transmission is by chains guarded on their top runs and both front and rear brakes are of the internal expanding variety. The remaining models are fitted with 350 c.c. Blackburne (side or overhead valve) engines.

Forecast and Guide to Olympia.—

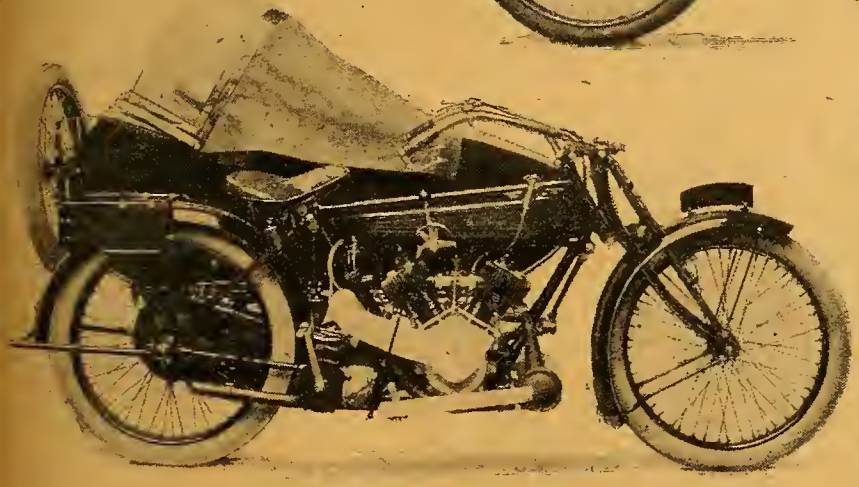


Well-silenced but quite speedy-looking Monopole lightweight.

Stand **MONOPOLE.**

37. With one exception all the Monopole models are fitted with single-cylinder J.A.P. engines, and generally speaking have been little altered since last Show.

A chain-driven 348 c.c. super-sports J.A.P. engined lightweight represents an entirely new model. It has a three-speed gear box, and is quite an attractive little machine without being in any way unconventional. A touring lightweight, a sidecar outfit to very much the same specification, a 293 c.c. chain-driven sporting machine, a chain-cum-belt 293 c.c. touring model, and a 247 c.c. Villiers engined direct belt two-stroke, complete the range.



Standard O.E.C.-Blackburne sidecar outfit.

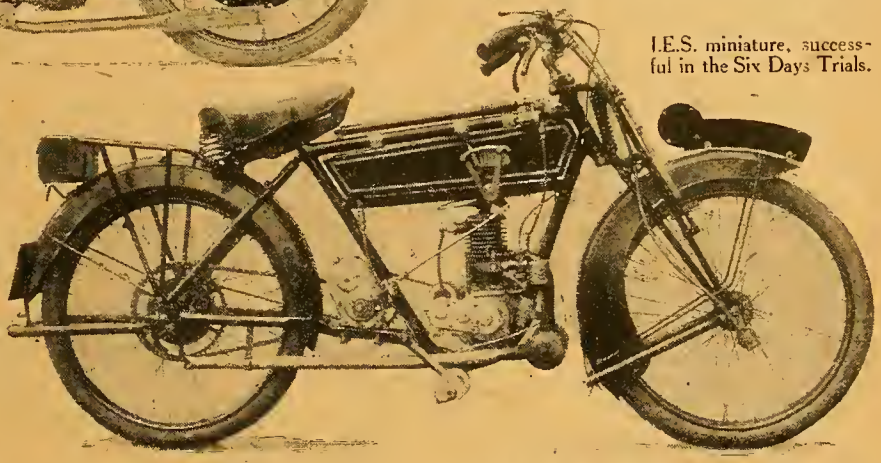
Stand **J.E.S.**

38. Three examples of the two main J.E.S. models will be shown—a single speed belt-driven miniature, a three-speed chain-driven miniature, and a four-speed, chain-driven 247 c.c. lightweight. The last-mentioned is new, and, after the historic performance of the four-speed 169 c.c. machine in the English Six Days Trials this year, it will be inspected with more than ordinary care. The engine is a straightforward three port two-stroke, but the gear box is on a principle uncommon to motor cycles, but often incorporated on machine tools, *i.e.*, of the sliding key constant mesh type. Engine lubrication is automatic.

Stand **O.E.C.-BLACKBURNE.**

40. For four years the Osborn Engineering Co., Ltd., made the Blackburne motor cycle, which it now markets under the name of the O.E.C.-Blackburne.

At last year's Show a minor sensation was caused by the O.E.C.-Blackburne sidecar taxi, with wheel steering. This model will again be shown; it is engined by a 1,098 c.c. Blackburne twin. Incidentally the wheel steering is readily adaptable to any make of motor cycle, and is recommended for use with sidecars that foul the handle-bars at full lock.



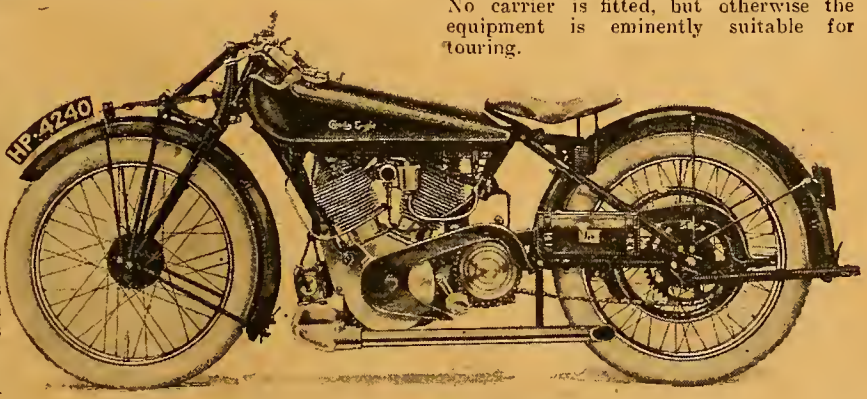
J.E.S. miniature, successful in the Six Days Trials.

More conventional single and double-seated sidecars will be staged, the two smaller twin and the largest single Blackburne engine being used.

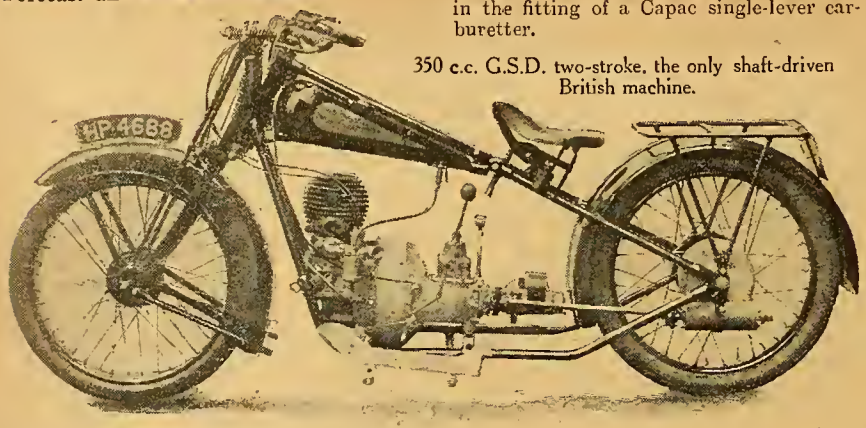
Finally there will be examples of a representative range of solo singles below 350 c.c.

Stand **COVENTRY EAGLE.**

43. Additions have been made at both ends of the extensive range of Coventry Eagle machines. An attractive miniature with a 147 c.c. Villiers two-stroke engine represents a worthy new supporter to the ever-growing class of ultra lightweight, and a super-sporting 976 c.c. twin similarly joins the ranks of luxurious solo mounts. The twin carries the super-sports J.A.P. engine in a very compact fashion, and generally speaking its very lines shout of speed and power. No carrier is fitted, but otherwise the equipment is eminently suitable for touring.



Super-sports 976 c.c. J.A.P. engined Coventry Eagle solo machine.



350 c.c. G.S.D. two-stroke, the only shaft-driven British machine.

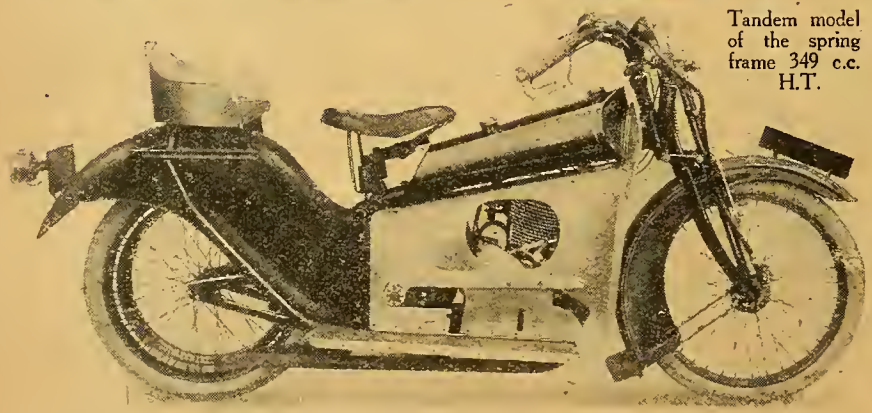
Stand **G.S.D.**

44. Notable if only as the sole British shaft-driven motor cycle, the G.S.D. embodies other advanced features in its design, including a transversely set engine in one unit with a four-speed gear box and a duplex frame.

A 350 c.c. White and Poppe two-stroke engine is normally used, but an additional model will be shown with a V-twin 976 c.c. J.A.P. unit.

An underslung worm conveys the power to the back wheel, which is easily detachable, although tyre repairs may be still more quickly effected by utilising the provision made for removing the inner tube.

26×3in. tyres and internal expanding brakes on front and rear wheels are features common to both models. Mudguarding has received considerable attention.



Tandem model of the spring frame 349 c.c. H.T.

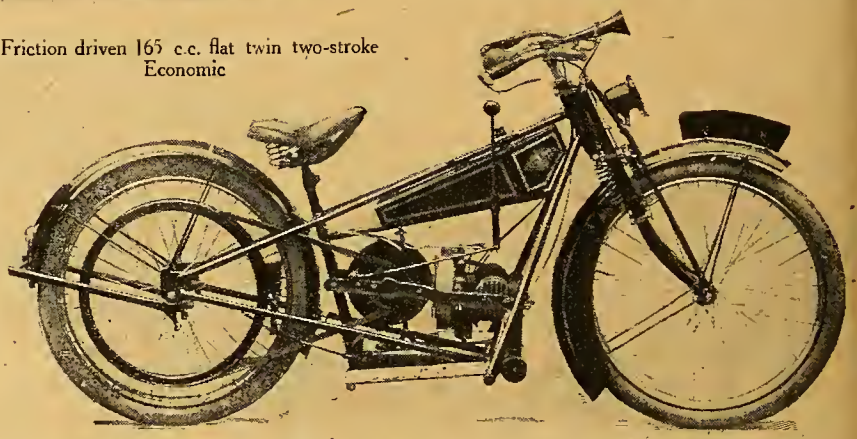
Stand **ECONOMIC.**

45. Last year the Economic was almost in a class by itself, both as regards price and engine capacity. To-day it is far from being alone in these respects, but the fact that it has a flat twin two-stroke engine and friction transmission prevents it from losing entirely its attributes of distinction. The capacity of this engine is 165 c.c.

Nine speeds are given by the friction gear, but these are necessarily within fairly confined limits, actually from 6 to 1 to 19 to 1. Final drive is by belt.

Improvements for next year have been made in the finish—black and gold—and in the fitting of a Capac single-lever carburetter.

Friction driven 165 c.c. flat twin two-stroke Economic



Stand **H.T.**

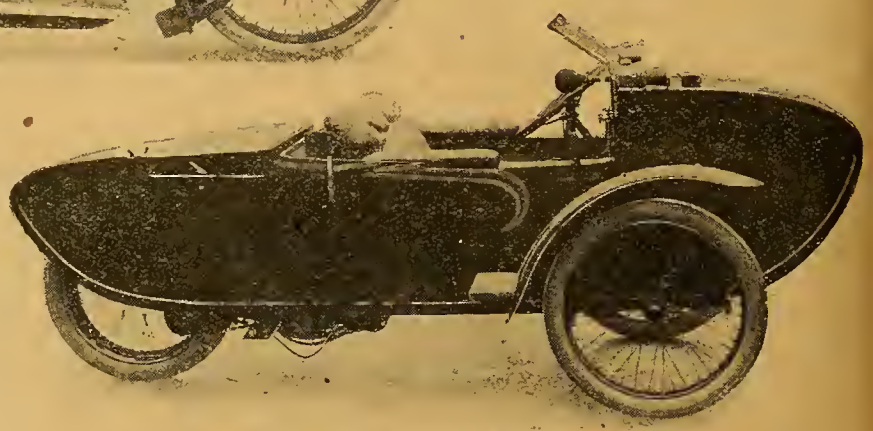
46. Known previously as the Hagg Tandem, the H.T. machine is now marketed in two forms, one a simple semi-stripped sporting motor cycle of conventional design, and the other a double- or single-seated two-wheeler, elaborately protected, and intended to attract the elderly comfort-seeking rider.

Barr and Stroud sleeve-valve engine and Burman two-speed gear box are common to both, but otherwise they are as the poles apart. The tandem has a well-tested spring frame and shields enclosing the entire mechanism.

Stand **XTRA CAR.**

47. No vehicle built offers such a remarkable choice of power units, while otherwise remaining essentially the same as the 1923 Xtra car. A two-seater model has been evolved; in the runabout form, it is fitted with a 347 c.c. Villiers engine and costs £105; in the "touring" form a 976 c.c. V-twin J.A.P. is substituted, when the price is increased to £122 17s., incidentally the lowest priced two-seater three-wheeler on the market.

On this unconventional vehicle, two pairs of transverse springs act as front axles and carry car type stub axles on pivot pins. Rear springing is by two quarter-elliptic springs. The body also acts in the same capacity as a chassis on a normal car.



New two-seated Xtra-car, with 347 c.c. Villiers engine.

Forecast and Guide to Olympia.—

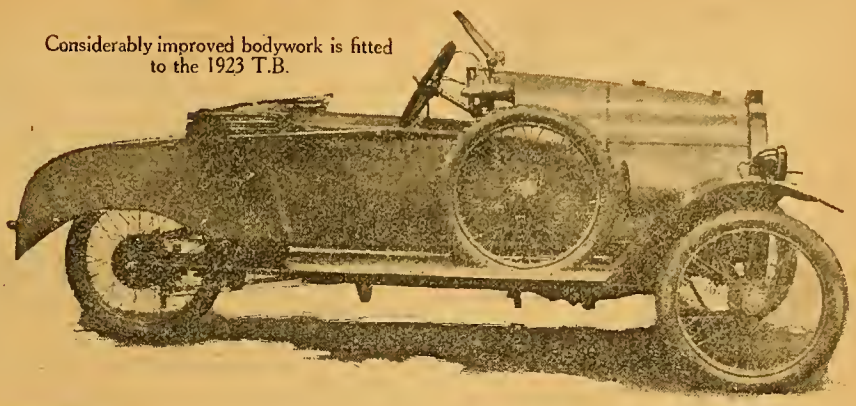
Stand **T.B.**

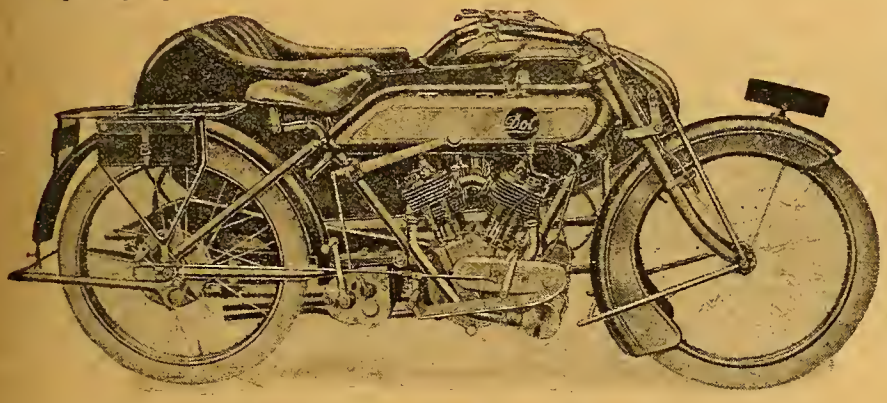
57. Except in the engine the T.B. three-wheeler follows car practice; it embodies a three-speed gear box and reverse, final shaft drive, semi-elliptic springing in front, and a form of cantilever suspension at the rear.

The standard model employs an air-cooled J.A.P. engine, while a water-cooled V-twin of the same make is fitted to the *de luxe* model. Finally, there is an aluminium-bodied sporting machine using the super-sports air-cooled J.A.P. engine.

Full equipment of horn, screen, hood, lamps, tools, and jack is supplied in every case, a spare wheel and electric lighting being included on the *de luxe* and sporting types.

Considerably improved bodywork is fitted to the 1923 T.B.





Touring Dot sidecar outfit, finished in cerise

Stand **DOT.**

59. Dot motor cycles have been on the market now for twenty years, which fact alone should carry considerable weight with the visitor to Olympia.

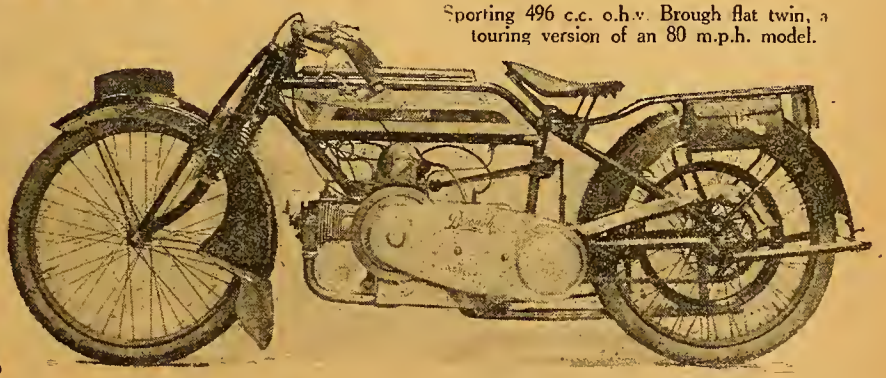
For next year all the machines have been thoroughly modernised, and, following the fashion of the day, are offered in sporting and touring guises. A 976 c.c. super-sports J.A.P.-engined 80 m.p.h. model deserves premier attention, but the 346 c.c. J.A.P.-engined sporting solo machine is also a good example of its class. Three-speed Sturmey-Archer and Albion gear boxes respectively are used, final drive being by chain. Adjustable handle-bars are a minor but useful refinement. 350 c.c. o.h.v. Blackburne, 250 c.c. J.A.P., or 350 c.c. Bradshaw engines may be fitted to the lightweight.

Stand **BROUGH.**

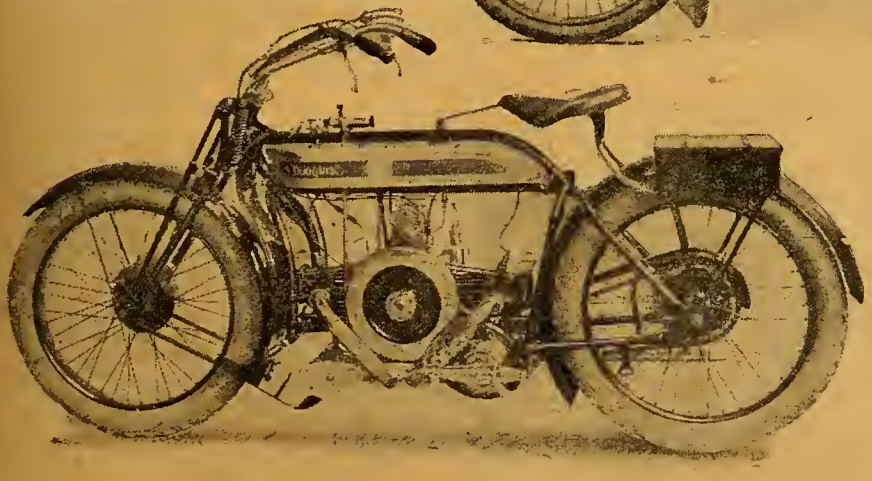
60. Considering that the speed model flat twin Brough is only 496 c.c., it is very remarkable that it should be supplied with a guarantee to exceed 80 m.p.h. This requires a specially-tuned engine, but the standard speed model is capable of 70 m.p.h. Overhead valves are employed, and aluminium alloy pistons and roller bearings for the crankshaft and the big ends also find a place on this model.

A touring model with a side-valve engine of the same size is also supplied for

Sporting 496 c.c. o.h.v. Brough flat twin, a touring version of an 80 m.p.h. model.



solo or sidecar use; a side-valve 682 c.c. dual-purpose machine completes the exhibit.



733 c.c. o.h.v. Douglas in a solo touring form.

Stand **DOUGLAS.**

61. Extensions have taken place to the famous range of Douglas flat twins, mainly in the form of additional models of existing types. For example, the familiar 348 c.c. Douglas may now be obtained with chain transmission and external contracting brakes on both wheels; the 595 c.c. model (which was virtually re-designed last year) is also offered with alternative transmissions; and the o.h.v. 733 c.c. machine is standardised as a sports solo as well as sidecar mount.

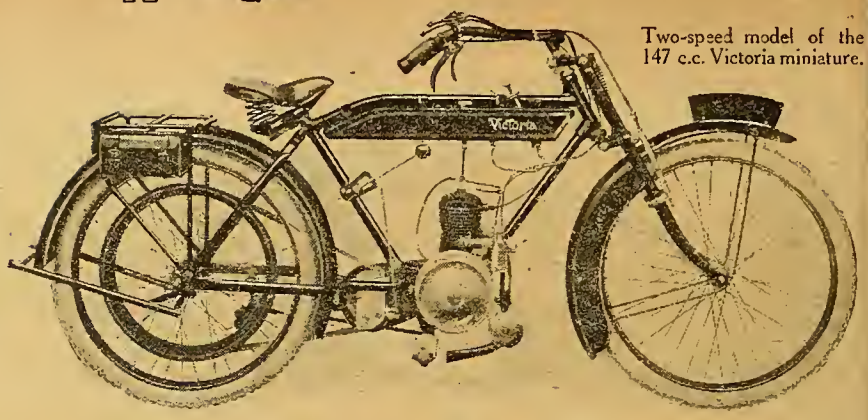
Perhaps least change of all has been made to the 494 c.c. o.h.v. Douglas, but even here considerable improvement has been effected in the transmission.

Forecast and Guide to Olympia.—

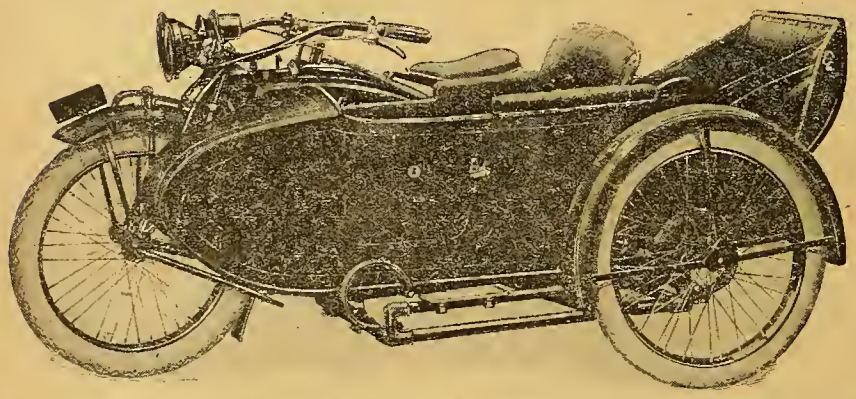
Stand **VICTORIA.**

62. Always noted for moderate price combined with sturdy design, the Scottish-built Victoria machines are offered in five main models for 1923. There are two-strokes using the three different sizes of Villiers engine—147 c.c., 247 c.c., and 347 c.c.—the remaining pair employing 348 c.c. and 550 c.c. J.A.P. engines respectively. Three-speed gear boxes are fitted in all but the two smallest types.

With a two-speed gear, the miniature is priced at £28, the other models ranging upward to £90 for the complete 550 c.c. sidecar outfit.



Two-speed model of the 147 c.c. Victoria miniature.



Imposing two-seated sidecar designed for the oversize 1,234 c.c. Indian Chief.

Stand **INDIAN.**

63. To be known as the "Super-Chief," a 1,234 c.c. Indian has been introduced to the British public for next year. In the main it is similar to the ordinary Chief (998 c.c.), which made its first appearance at the last Show, and is, of course, retained.

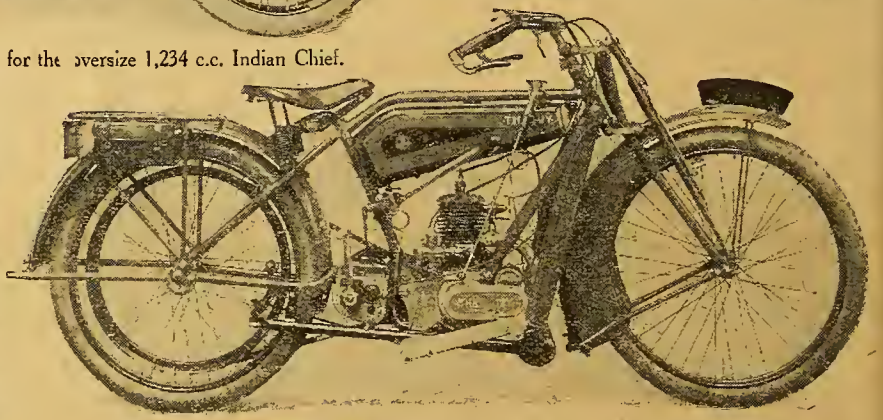
With a double-seated sidecar of the Princess type it makes an outfit capable of high-speed touring "three up"; full electrical equipment is included in the price of £167.

The electrically equipped solo models of the 998 c.c. Chief, 998 c.c. spring frame machine, and 596 c.c. Scout are respectively £132, £123, and £113. Suitable sidecars are available for all.

Stand **IVY.**

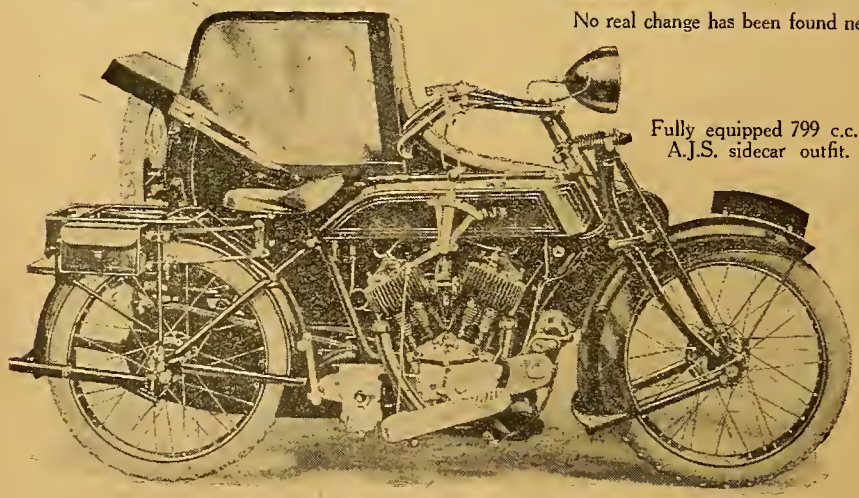
64. Chief interest on the Ivy stand will probably centre round the new 349 c.c. four-stroke, the design of Mr. H. C. Newman. There is, however, nothing startling or unconventional about the new engine, which is built on straightforward, common sense lines. It has very deep radiating fins, a detachable cylinder head, and an outside flywheel.

The main change on the two-stroke models is an oval transfer port which allows the piston ring bridge pieces to



No real change has been found necessary on the 250 c.c. Ivy.

be dispensed with. An open frame lady's model will be shown.



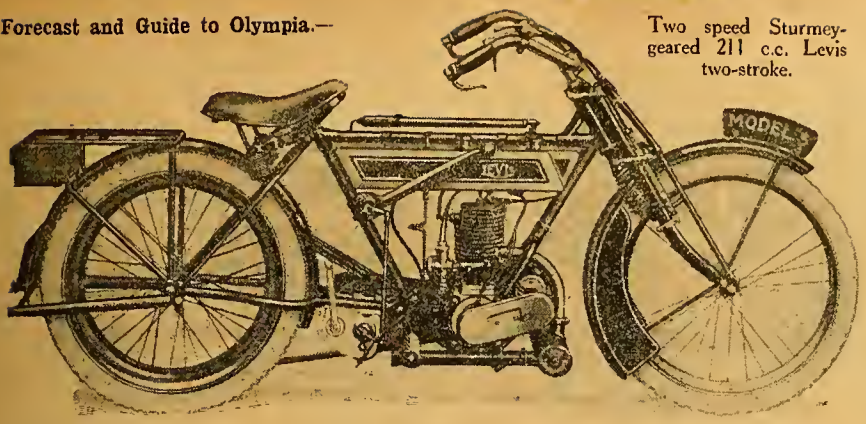
Fully equipped 799 c.c. A.J.S. sidecar outfit.

Stand **A.J.S.**

67. The marketing of the o.h.v. 349 c.c. A.J.S., of T.T. fame, will draw huge crowds to this stand. In effect, the new model is practically a replica of the I.O.M. machines, although one or two modifications have been incorporated to ensure a longer life to vital parts of the engine. For example, the valve guides are longer. An aluminium piston is now fitted, but the arrangement of four narrow rings above the gudgeon pin is retained. The radiating fins on the head have also been modified.

The side-valve 349 c.c. machines are retained with improved mudguarding and aluminium pistons, alterations which have also been made to the 799 c.c. sidecar outfits.

Forecast and Guide to Olympia.—



Two speed Sturmey-geared 211 c.c. Levis two-stroke.

Stand **LEVIS.**

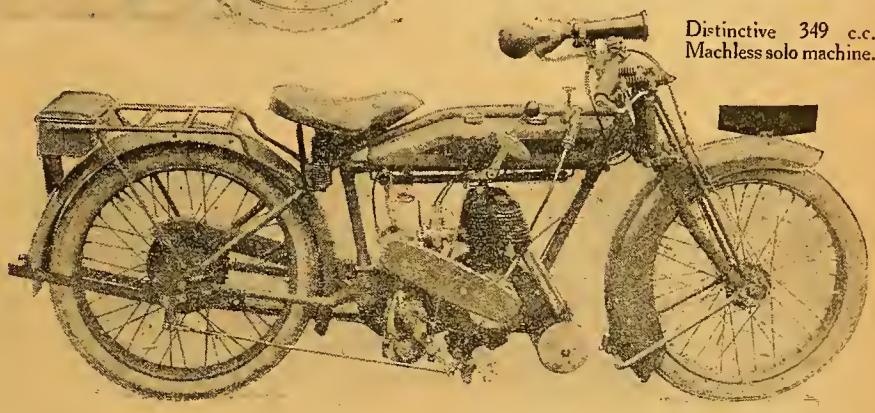
68. By winning the lightweight classes in the T.T., and the French Grand Prix, as well as a team prize in the Six Days Trial, the Levis has this year accomplished an unparalleled achievement in the annals of motor cycle competition.

Four models will be shown, three embodying the 211 c.c. engine, and one—at £68, the most expensive—the 247 c.c. unit with a three-speed Sturmey-Archer gear box, all-chain drive and two internal expanding brakes in the rear wheel. Two of the 211 c.c. machines have chain-cum-belt transmission, but differ in gear box (Sturmey-Archer two-speed with clutch and kick-starter, and Burman ditto), and in frame design (parallel top tube or sloping top tube).

At £38 the single-geared machine represents an excellent combination of simplicity and proved reliability.

Stand **MATCHLESS.**

71. In 1923 the makers of the popular Matchless sidecar outfit will attack the solo market in a thorough style. They will offer a 349 c.c. Blackburne-engined machine and a 976 c.c. super-sports J.A.P. engined big twin, both with a specification to attract the soloist, including Sturmey gear boxes, T.T. bars and foot-rests. The smaller model is sensibly designed, with adequate mud-guarding, silencing, and tyres (650 × 65 mm. on voiturette rims), and a Lucas Magdyno may be fitted without structural alterations.

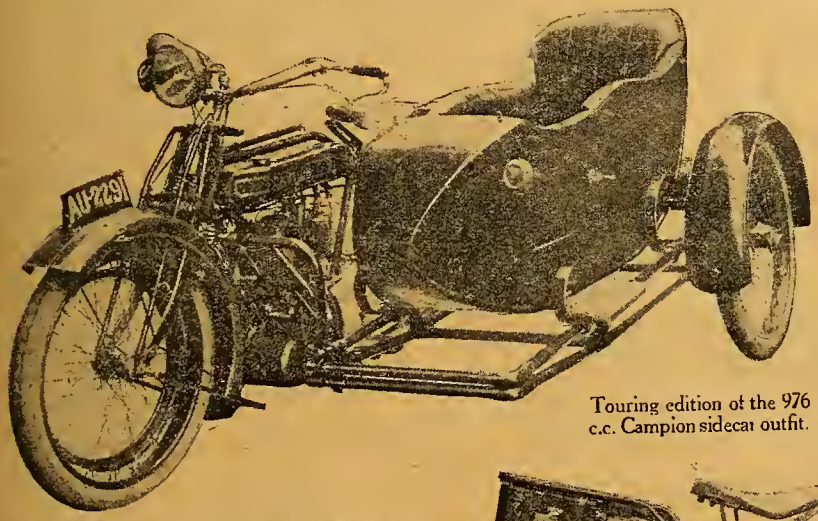


Distinctive 349 c.c. Machless solo machine.

Stand **CAMPION.**

72. Of the seven Campions to be shown, probably the most striking is a sporting sidecar outfit with a super-sports 976 c.c. J.A.P engine and a Jardine four-speed gear. Two touring outfits also have J.A.P. engines, but employ a Sturmey-Archer three-speed gear. One of the touring outfits and the sporting model have interchangeable wheels.

Intermediately there is a workmanlike 550 c.c. solo single with Sturmey gear and chain drive; and at the other end of the scale are three lightweights with various power units (J.A.P., Blackburne, and Villiers), and transmissions.



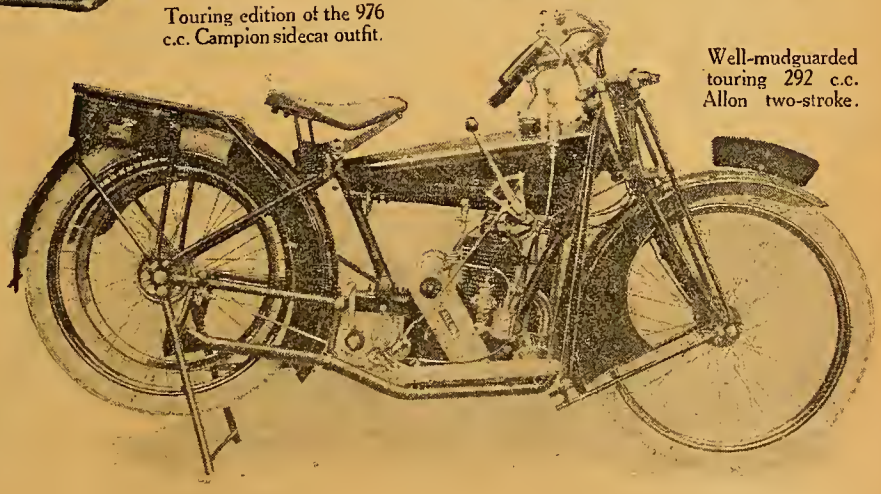
Touring edition of the 976 c.c. Campion sidecar outfit.

Stand **ALLON.**

73. In this year's Six Days Trials the Allon team made a very fine performance. Although of only 292 c.c. capacity this two-stroke has proved that it can compete with 350 c.c. machines on most points desired by the average rider, *i.e.*, reliability, hill-climbing, etc.

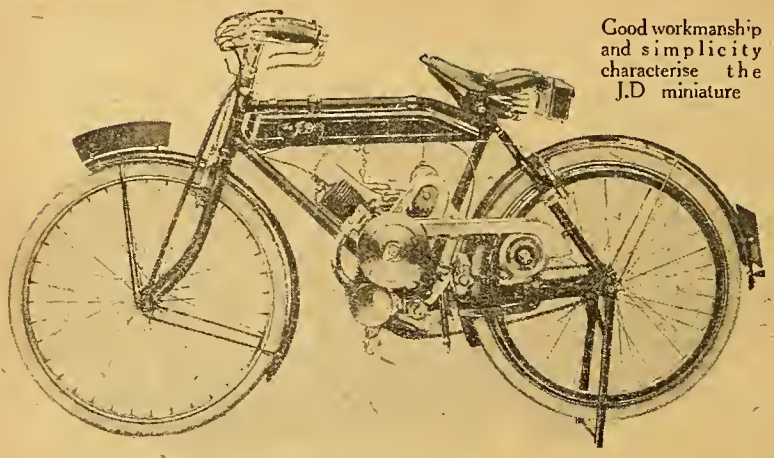
Ignition on the two stroke will be, as before, by Villiers flywheel magneto, but the engine, of course, is of Allon manufacture.

An entirely new model employs a 348 c.c. four-stroke J.A.P. engine in a very similar frame.



Well-mudguarded touring 292 c.c. Allon two-stroke.

Forecast and Guide to Olympia.—

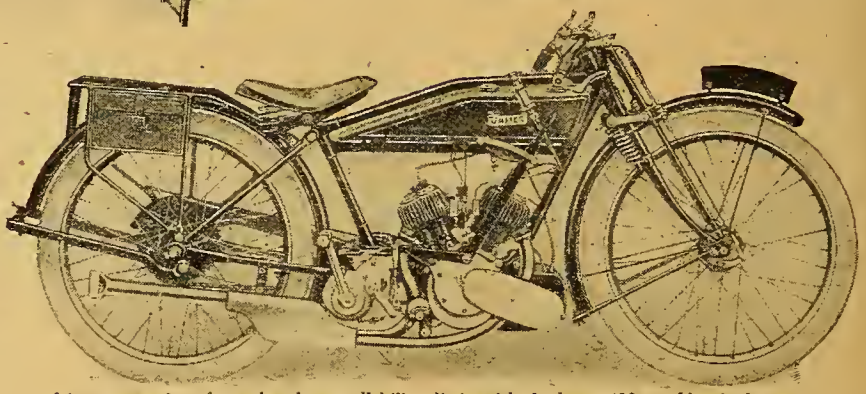


Good workmanship and simplicity characterise the J.D miniature

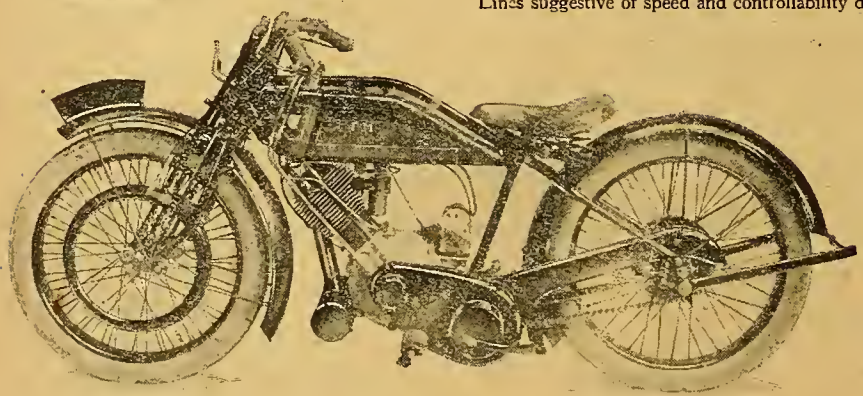
Stand **J.D.**

74. In evolving the J.D. miniature, quite the most elaborate and high-class single-gear machine of its type, the firm of Bowden Wire, Ltd., has attempted to interest a new market. An appeal is made to the confirmed pedal cyclist who desires the help of an engine in a vehicle as simple and yet as reliable and well-finished as his bicycle.

The 116 c.c. two-stroke engine is well made and powerful enough for ordinary use; it transmits its power to the rear wheel *via* a fool-proof friction pulley drive, capable of being used as a clutch by means of handle-bar controlled Bowden mechanism.



Lines suggestive of speed and controllability distinguish the latest 498 c.c. V-twin James.



To give speed and comfort is the aim of the P. & M. "Panther."

Stand **JAMES.**

75. Interest on the James stand will be divided between the new 350 c.c. single, which made a creditable first appearance in the Six Days Trials, and the redesigned 598 c.c. twin.

Perhaps the latter deserves premier attention for it is one of a very small class nowadays, but a particularly attractive example. Detachable cylinder heads, a frame on the lines of the 350 c.c. model —*i.e.*, with a much sloping top tube—and various engine modifications making for greater efficiency are the chief improvements.

The 350 c.c. single is likewise a worthy example of its class, an ever-growing class in this case.

Only slight modifications have been made to the 749 c.c. sidecar outfit and to the lightweight two-stroke.

Stand **P. & M.**

77. With the introduction of a sporting model the makers of the P. & M. cater for a class of motor cyclist not hitherto greatly attracted by the sterling qualities of reliability and long life for which this machine is noted.

High road performance *plus* comfort has been the aim, and to this end a new frame has been evolved giving a low riding position with an excellent ground clearance. Various changes such as the substitution of an aluminium piston have been made to the 555 c.c. to increase its efficiency.

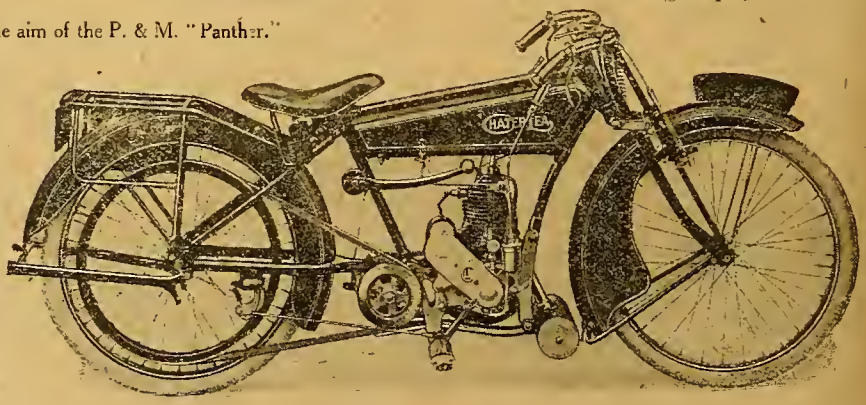
The P. & M. four-speed gear is a valuable feature.

Stand **CHATER-LEA.**

78. Next year's range of four Chater-Lea motor cycles is comprehensive without being too extensive.

A 976 c.c. twin, a 545 c.c. single and a 269 c.c. two-stroke are fitted with the firm's own engines, while a 348 c.c. sporting model uses a Blackburne unit of the o.h.v. or side-valve type.

The 545 c.c. single is typical of the four, being a substantially built but neat looking dual-purpose mount with a three-speed Sturmey gear box, chain transmission and internal expanding brakes on both wheels. One of its novel features is the method of driving the magneto from a sprocket on the mainshaft, a two to one reduction being employed.



Symmetrically designed and well mudguarded Chater-Lea two-stroke.

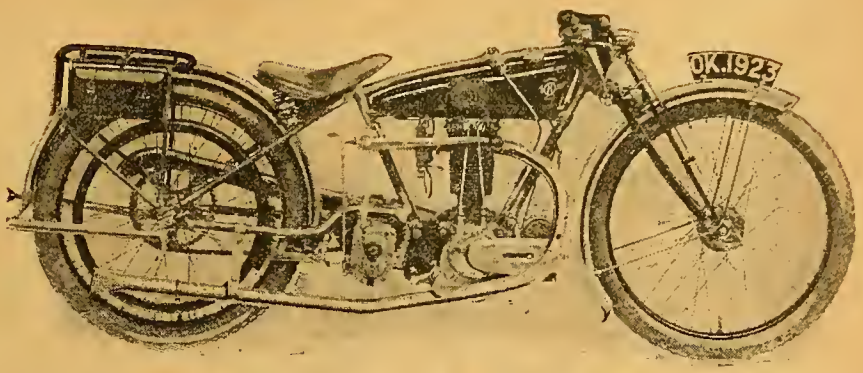
Forecast and Guide to Olympia.—

Stand **O.K.**

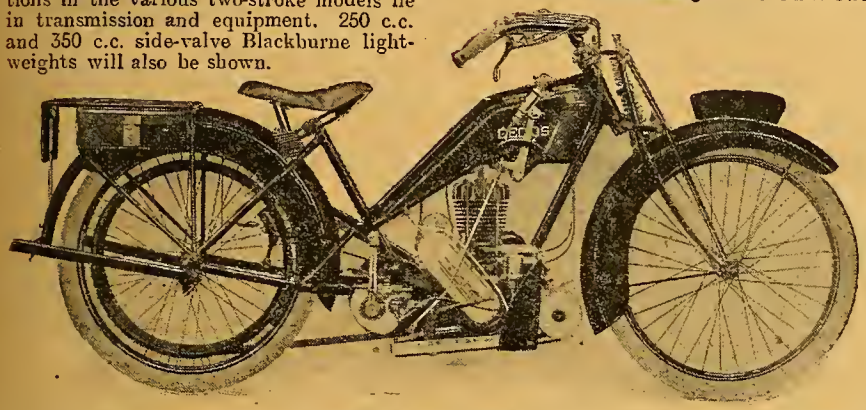
79. Many successes have been scored by a 250 c.c. o.h.v. O.K.-Blackburne in important races and speed events this year, and the marketed replica of this model will inevitably command much attention.

On this and all other O.K. models the frame has been redesigned, the top tube curving gradually downwards from the steering head. Brampton forks are now fitted, a racing type on the o.h.v. model.

Three of the exhibits will be fitted with the 292 c.c. O.K. two-stroke engine, following the same lines as the machines that won the 350 c.c. team prize in the Six Days Trials this year. The variations in the various two-stroke models lie in transmission and equipment. 250 c.c. and 350 c.c. side-valve Blackburne lightweights will also be shown.



Race-winning 250 c.c. o.h.v. O.K.-Blackburne in its marketed form.



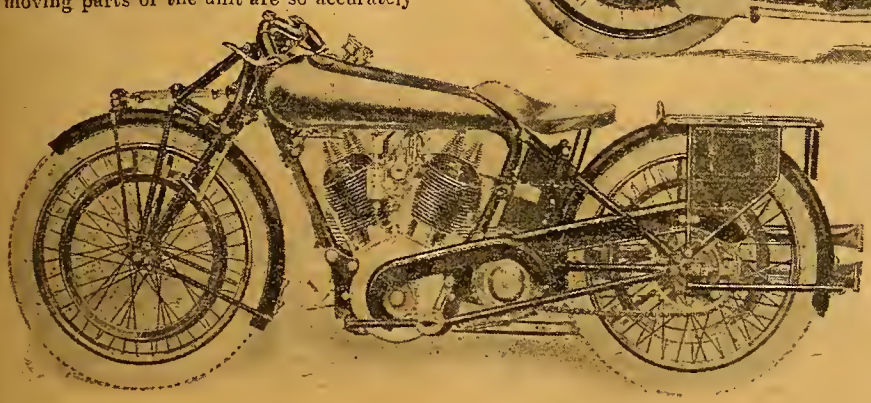
One of the most popular machines with lady motor cyclists is the 247 c.c. Cedos open frame model.

Stand **CEDOS.**

80. Cedos two-stroke motor cycles have always had an excellent reputation for clever design, reliability, and good workmanship, and when their manufacture was temporarily discontinued owing to external reasons it was not long before a new company recognised their possibilities.

Considerable improvements have been made in the 1923 design. Two models are being concentrated upon—a standard, with 26in. wheels, and a lady's, with 24in. wheels—both employing the same 247 c.c. engine.

The cylinder, which has a detachable head, has been evolved with a view to avoiding heat distortions. Again, the moving parts of the unit are so accurately ground to size that it is unnecessary to balance each engine individually.



Guaranteed 80 m.p.h. but docile as a lightweight "S.S. 80" Brough Superior.

Stand **FRANCIS-BARNETT.**

81. Belt drive has been entirely abandoned by the makers of the Francis-Barnett, a J.A.P.-engined lightweight, notable for its finish and detail design.

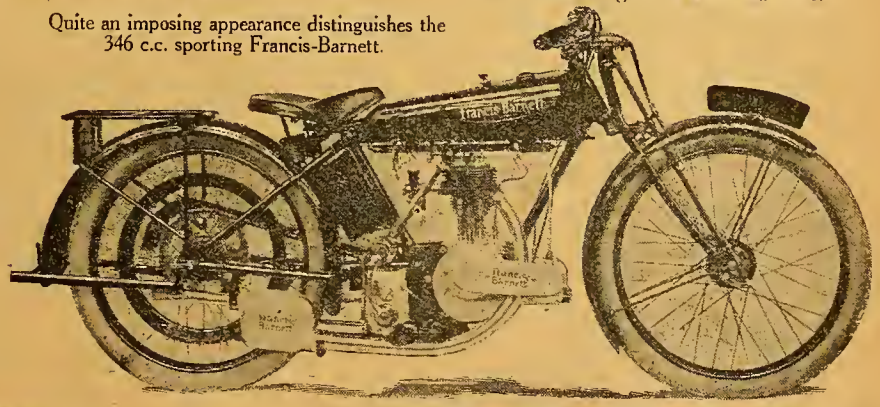
The chief model is fitted with a 346 c.c. J.A.P. single, and is obtainable in touring, sporting, and sidecar forms. All three are attractive in appearance, the sports model particularly so, being finished in grey and mauve. Sturmey-Archer three-speed gear boxes and saddle tanks are salient features.

When a 292 c.c. J.A.P. engine is used a choice of two- or three-speed gear boxes is allowed.

Stand **BROUGH SUPERIOR.**

89. In a very short space of time the Brough Superior has earned a name for itself that conjures up the most luxurious form of solo motor cycle. It was the first serious attempt to produce a *de luxe* British big twin solo machine.

Quite an imposing appearance distinguishes the 346 c.c. sporting Francis-Barnett.



The "S.S.80," a new type employing the super-sports J.A.P. engine, made its first appearance in the Six Days Trials, when it gained a gold medal and earned more bonus marks in the speed test than any other machine.

The o.h.v. J.A.P. and smaller M.A.G. models are retained.

Stand **HACK.**

117. In effect the Hack is a scooter with a seat, but that it is quite a practicable proposition is illustrated by a recent test, officially observed by the A.C.U., in which two machines covered 100 miles at an average speed of 16.3 m.p.h. The two-stroke engine is 110 c.c. and the tyre size $20 \times 1\frac{3}{4}$ in

Forecast and Guide to Olympia.—

Stand **MOHAWK.**

92. So far as solo mounts are concerned, the chief specialities of the Mohawk Cycle Co. are a 293 c.c. J.A.P.-engined machine and a 350 c.c. sports model, both fitted with a Sturmey-Archer two-speed gear boxes. A standard 350 c.c. machine has chain transmission.

Passenger enthusiasts have not been neglected, since the company also produces a useful 680 c.c. J.A.P.-engined sidecar model fitted with a three-speed gear and chain transmission.

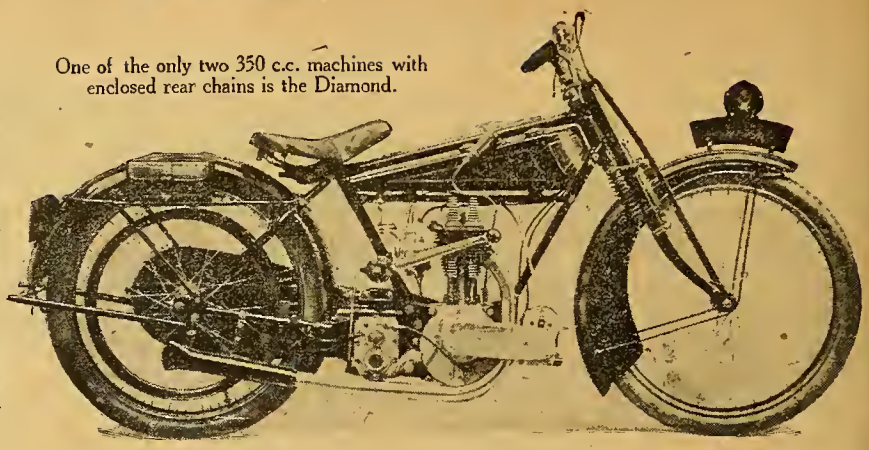
Stand **DIAMOND.**

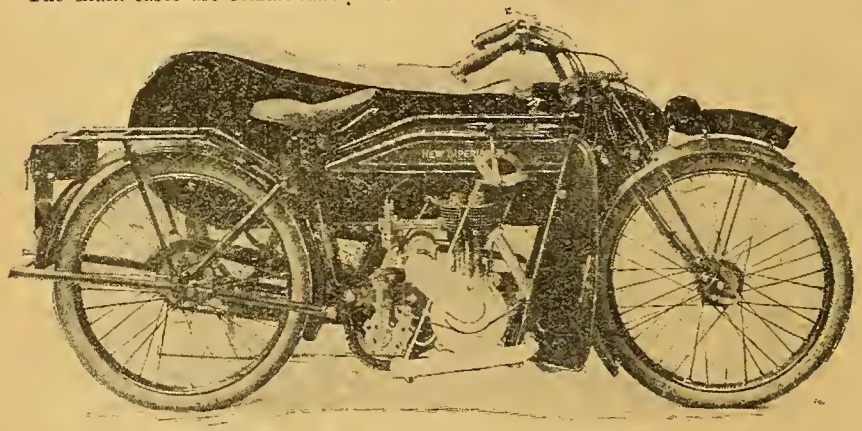
93. Particularly neat frame design and a number of examples of fully enclosed chain transmission are the chief characteristics of the Diamond motor cycles.

The chain cases are commendably clean in appearance, and instead of detracting from, probably add to, the beauty of the machine.

J.A.P., Villiers, and Barr and Stroud engines are employed.

One of the only two 350 c.c. machines with enclosed rear chains is the Diamond.





New light touring 349 c.c. New Imperial sidecar outfit.

Stand **NEW IMPERIAL.**

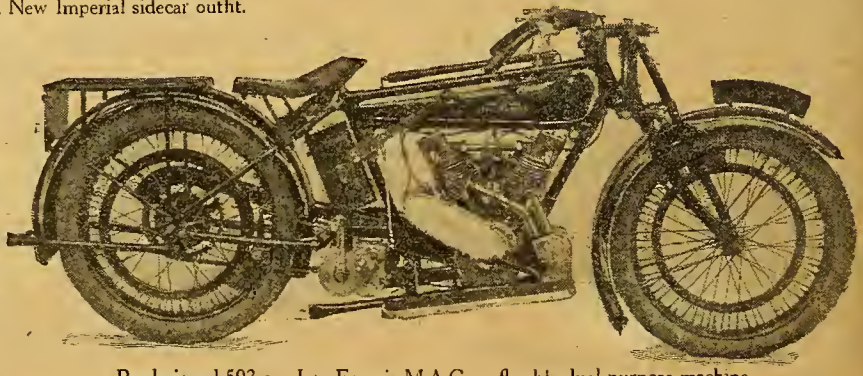
94. In view of the discussion regarding noisy motor cycles, it is notable that great attention has been paid to the silencing of the New Imperial sports models, but otherwise little change has been found necessary. The chief single-cylinder models are 248 c.c. sports, 293 c.c. light touring, and 348 c.c. sports and touring. A special sidecar which is remarkable for its roominess and comfort has been evolved for the last mentioned model.

Some improvements have also been made in the big twins, which now have loop frames on similar lines to the lightweights.

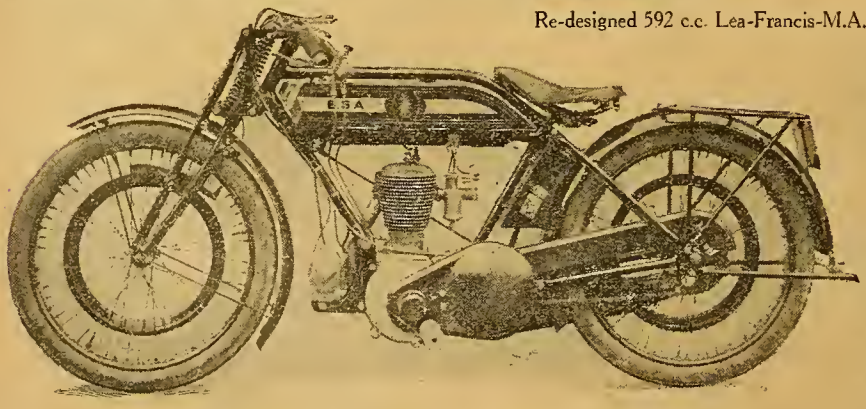
Stand **LEA-FRANCIS.**

95. For many years Lea-Francis motor cycles have enjoyed a reputation for very excellent finish and, while retaining this trait for 1923, they have been thoroughly modernised, particularly the frame design.

Two models only are specialised on, both being fitted with V twin M.A.G. engines, and both suitable for solo or sidecar work. Although the two are alike in some respects, they differ considerably in specification. The smaller (496 c.c.) machine has a Lea-Francis three-speed gear box, Druid forks, and 26×2½in. tyres, while the larger (592 c.c.) has a Burman gear box, Brampton forks, and 26×3in. tyres.



Re-designed 592 c.c. Lea-Francis-M.A.G., a flexible dual-purpose machine.



Sturdy simplicity is the keynote of the 493 c.c. sporting B.S.A.

Stand **B.S.A.**

96. Famous throughout the world for excellent finish, solidity and reliability, the B.S.A. is made by a company that is not content to rest upon its laurels. It has introduced an entirely new 493 c.c. sports model with mechanical lubrication, as well as a 349 c.c. machine, which is to a certain extent a small edition of the first named. Both models are chain driven, and great attention has been paid to mudguarding, legshields being included in the equipment of the 349 c.c. machine

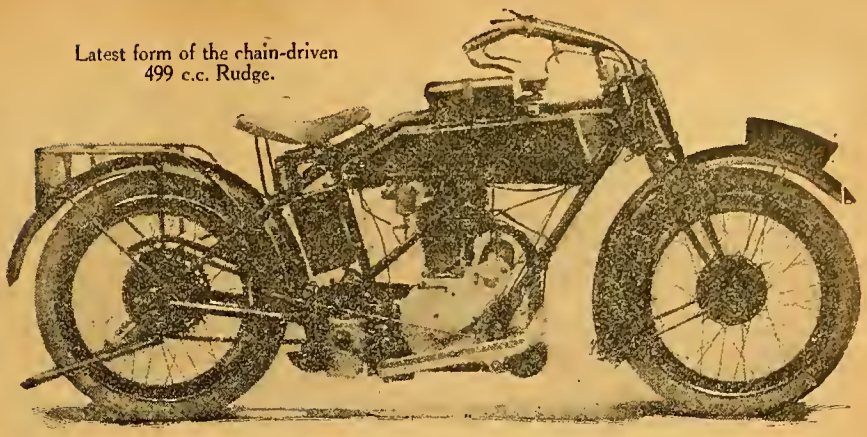
Forecast and Guide to Olympia.—

Stand **RUDGE.**

97. Popular on account of its liveliness, ease of steering and steadiness, the chain-driven Rudge has not undergone serious modifications for 1923. The alterations are an improved toolbag on the top tube, and a slight change in colour. Some improvement has also been made in the domed mudguards, which are now 6 in. across. Both the single and twin cylinder models will be available with a new four-speed gear box.

Worthy of note is the ingenious construction of the new sidecar chassis, which consists of a tubular hairpin, one side of which runs parallel with the centre line of the machine. The frame is very rigid owing to the construction of the rear axle, which is a straight tube with massive forgings at both ends. This axle may be easily unclipped and reversed so that the chassis may fit the other side of the machine.

Latest form of the chain-driven 499 c.c. Rudge.

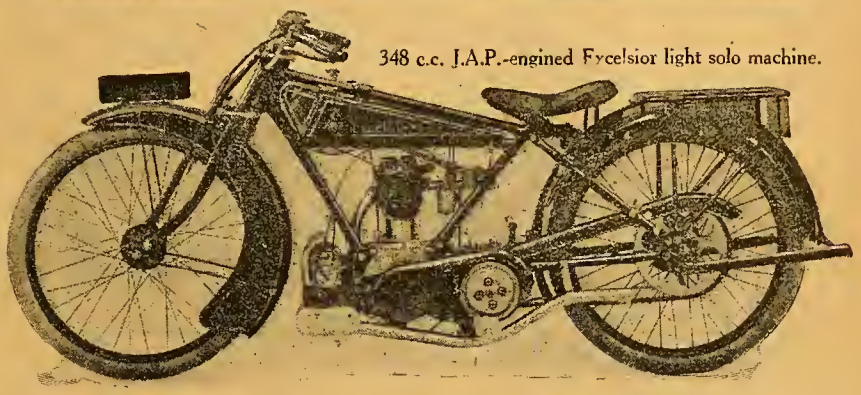


Stand **EXCELSIOR.**

98. Extending from a 147 c.c. Villiers-engined lightweight at £28 10s. to a 976 c.c. J.A.P.-engined sidecar outfit at £123, the Excelsior range of models caters for extreme tastes without reaching extremely high prices. In between are another Villiers model (247 c.c., £48), a 348 c.c. J.A.P. (£67), and a 349 c.c. Blackburne (£67).

The miniature is fitted with a plain two-speed gear box, the remaining two-stroke has the same ratios, but a clutch and kick-starter, and the larger machines have three-speed boxes with all-chain drive. For £3 7s. 6d. extra the 147 c.c. model may be fitted with a clutch and a lighting set.

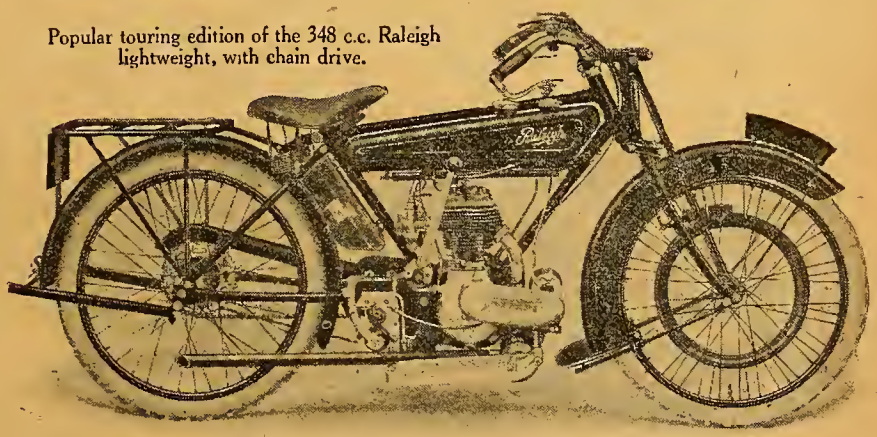
348 c.c. J.A.P.-engined Excelsior light solo machine.



Stand **RALEIGH.**

99. One way in which the Raleigh engine differs from many others is that it has a scoop on the big end to pick up oil from the crank case. The chain-driven machine is of attractive appearance, and can be fitted with a 348 c.c. or 398 c.c. engine; for the latter a special sidecar and tradesman's carrier have been designed. An internal expanding rear brake of large diameter has been embodied. The finish of the Raleigh is, of course, without reproach, while its performances in reliability trials at home and abroad are very much to the credit of its makers. Sixty-five m.p.h. is claimed for a sports model.

Popular touring edition of the 348 c.c. Raleigh lightweight, with chain drive.



Stand **SUN.**

100. Since the makers of Sun motor cycles have always specialised in lightweights, it is only natural that they should turn to meet the growing demand for workmanlike miniatures.

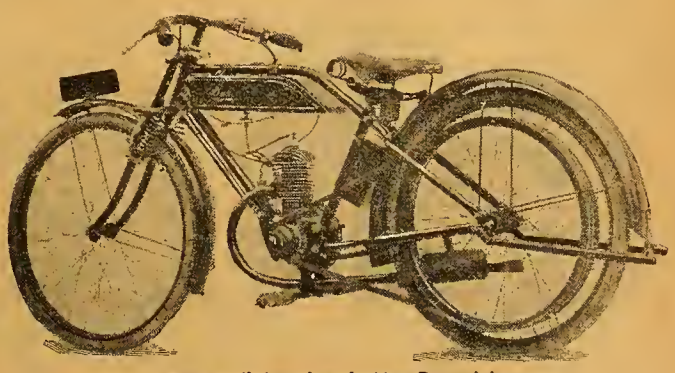
Absolutely the simplest lines are followed by the new ultra-lightweight (a two-stroke), but spring forks are fitted and pedalling gear is dispensed with.

Stand **HOBART.**

101. No Hobart for next year will exceed 350 c.c., the exhibit consisting of five lightweights and two examples of a new miniature to be marketed at a very moderate price.

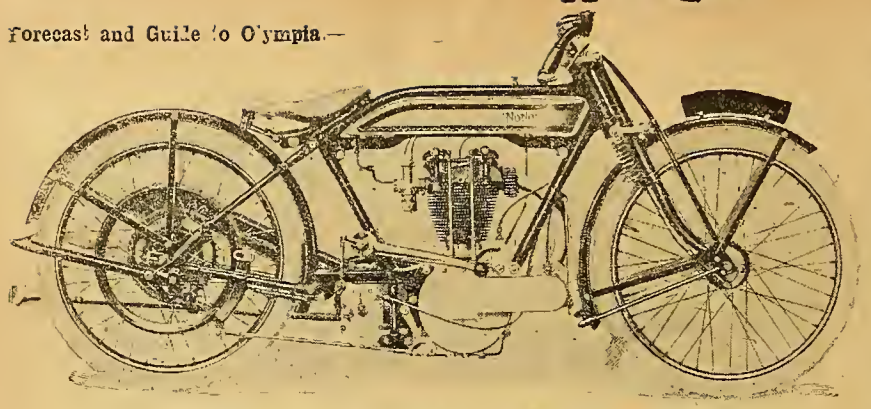
Three of the lightweights, 348 c.c. sports J.A.P., 348 c.c. touring J.A.P., and 349 c.c. Blackburne models, have final chain drive, 249 c.c. Blackburne and 293 c.c. J.A.P.-engined machines having chain-cum-belt transmission.

The miniature is a two-stroke of the simplest description, which the makers anticipate will arouse great interest.



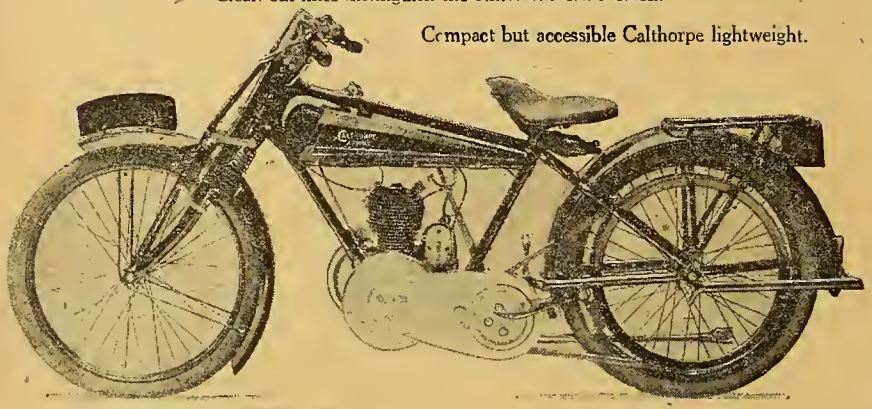
Lightly built but clean-looking Sun miniature.

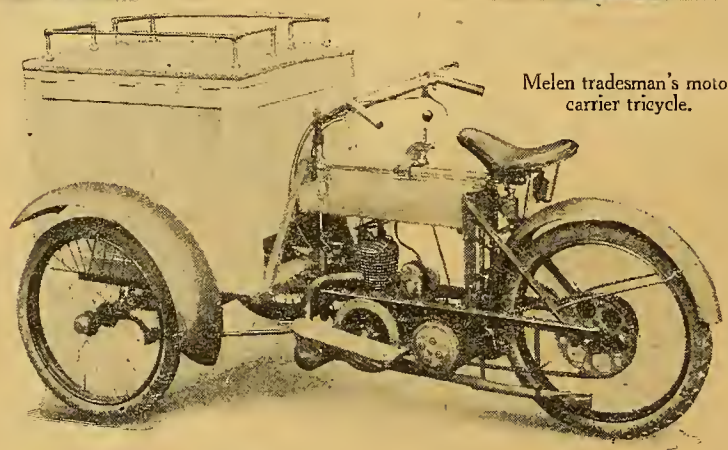
Forecast and Guide to Olympia.—



Clean cut lines distinguish the o.h.v. 490 c.c. Norton.

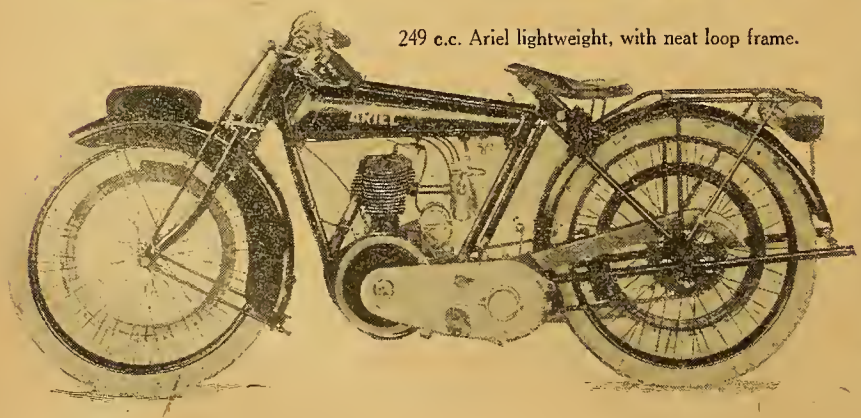
Compact but accessible Calthorpe lightweight.





Melen tradesman's motor carrier tricycle.

249 c.c. Ariel lightweight, with neat loop frame.



Stand **BOWN.**

102. There are three main models of the Bown lightweight, fitted respectively with 349 c.c. Blackburne, 348 c.c. J.A.P., and 247 c.c. Villiers engines.

Various forms of transmission (final belt or chain) and gear box (two or three speed) are offered, thus multiplying considerably the actual number of models available.

Also on show will be an ultra lightweight, embodying the 147 c.c. Villiers two-stroke engine, and direct belt drive, or a two-speed gear box and chain and belt transmission.

Stand **NORTON.**

103. Norton machines have long held an enviable reputation not only for speed but for reliability. The overhead valve model is very nearly an ideal fast touring or competition mount, but although it has now reached production form, and was shown at the Paris Show, it has not yet become well known, and its exhibition at Olympia will be looked forward to with interest.

Naturally the 490 c.c. side-by-side valve-engined machine will also be shown; it is now fitted with wide, flat mudguards, footrests, and legshields.

Finally there is the 633 c.c. Big Four, mainly for sidecar haulage, but sometimes used solo.

Stand **CALTHORPE.**

104. For next season there will be three Calthorpe models: a 250 c.c. single-geared machine; a two-speed model with a new engine, the power of which has been considerably improved, fitted with a Burman two-speed gear with clutch and kick-starter; and a 350 c.c. sidecar outfit. It is worth recording that the Calthorpe Motor Cycle Co. has done much towards popularising economical sidecar outfits, for the engine fitted was one of the first 350 c.c. two-strokes to be a practical proposition for passenger work.

Stand **MELEN.**

105. Tradesmen and others with a lot of light delivery work will be interested in this exhibit, which consists of a self-propelled carrier tricycle.

The framework is very strongly carried out, and the vehicle, although retailing at a moderate price, is in no sense a motorised pedal carrier. A 297 c.c. Union engine is used.

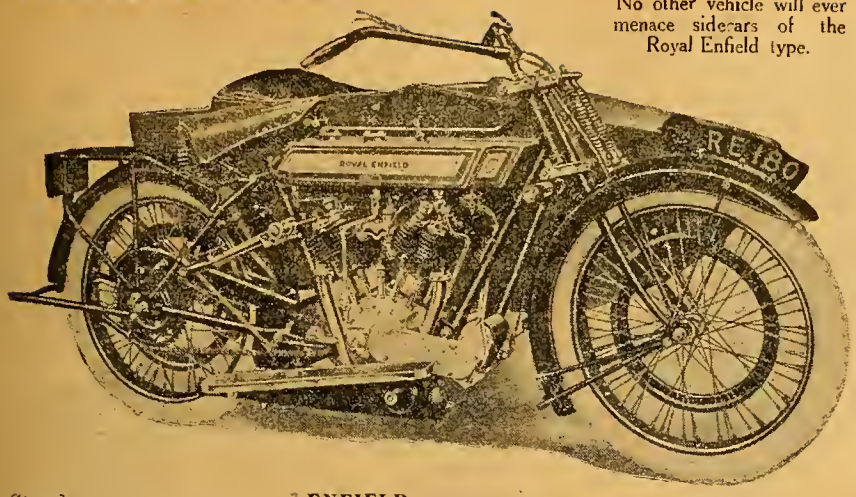
Stand **ARIEL.**

106. From the earliest days the name Ariel has figured in motor-cycle history. Though they were pioneers of the lightweight machine in the days of the surface carburetter, its makers have recently been better known for medium- and heavyweight machines, and only this year have they reverted to a 249 c.c. machine.

A chain-driven 498 c.c. mount is also a new model.

For those who want plenty of power there are 796 c.c. and 993 c.c. engined machines, as well as the familiar 665 c.c. single-cylinder sidecar outfit. Belt drive is retained only on the 498 c.c. sports model.

Forecast and Guide to Clympia.—



No other vehicle will ever menace sidecars of the Royal Enfield type.

Stand **ENFIELD.**

107. It is not difficult to discover the reason, or reasons, for the great popularity of the 976 c.c. Enfield sidecar outfit. Not only is it moderately priced, but it has a high road performance, an attribute helped by a light and simple two-speed gear, instead of the more common but heavier three- or four-speed box. The average man, who does not wish to climb freak hills, does not notice the absence of a third ratio.

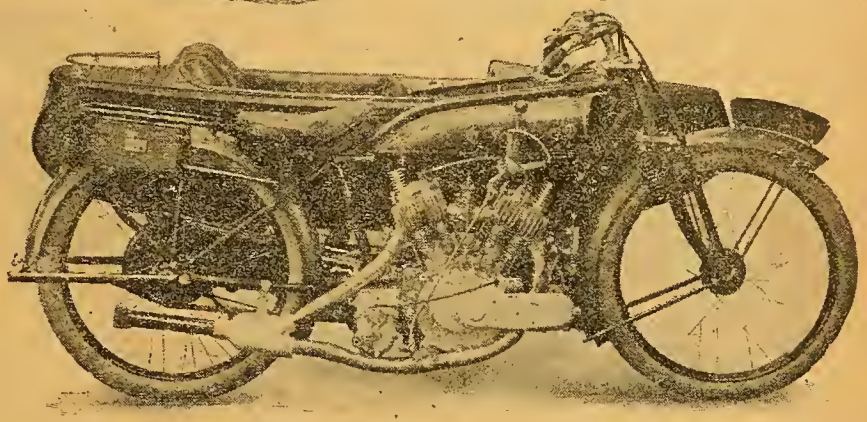
Innovations for next year are a foot-operated front brake and a locking device for the rear brake. The tools are now accessibly carried in a wallet on the sidecar door.

No extra charge is made for a kick-starter on the 225 c.c. two-stroke, which is retained in its touring and sporting forms.

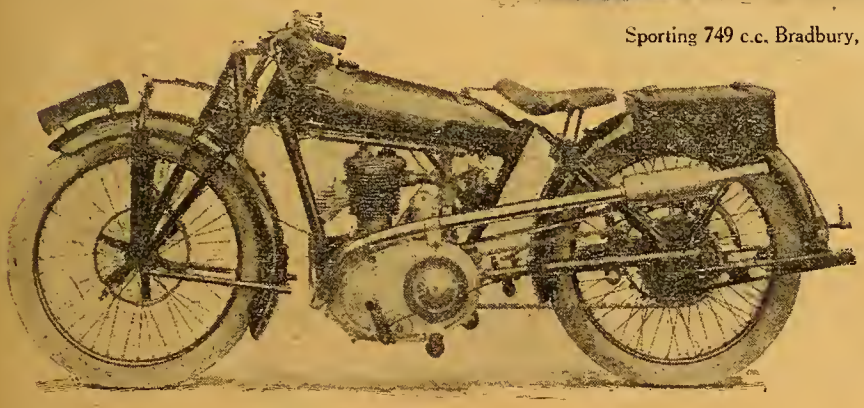
Stand **BRADBURY.**

108. Recent successes at Brooklands have proved that the new Bradbury is speedy as well as reliable. The lines of the machine have been greatly improved, and are now really attractive.

Three principal models are: a 350 c.c. single, a 554 c.c. single, and a 749 c.c. twin. All these have four-stroke engines made throughout by Bradbury and Co., Ltd. It is also worthy of note that the silencing arrangements have received careful study.



Sporting 749 c.c. Bradbury, with attractive Canoelet sidecar.



New sporting 496 c.c. Beardmore on the lines of the I.O.M. machine.

Stand **BEARDMORE-PRECISION.**

109. One of the chief novelties of the Beardmore range of machines is a 346 c.c. four-stroke with side by side valves, and an outside flywheel.

There is also a 500 c.c. machine equipped with a modification of the T.T. engine, eminently suitable for fast solo riding. The 598 c.c. big single remains largely unaltered.

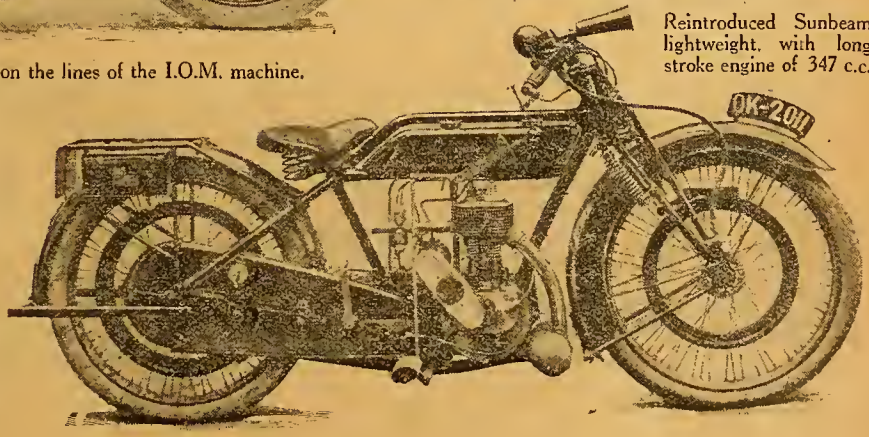
Pressed steel construction has been a feature of Beardmore-Precision motor cycles during the last four years, and it is now even further developed as the back stays are steel pressings in the latest models.

Stand **SUNBEAM.**

110. Pronounced successes in important competitions continued to go to Sunbeam motor cycles during 1922, as in previous years, but even had Sunbeam riders abstained absolutely from trials and races there are enough features of note on the design of the machines to attract crowds to this stand at Olympia.

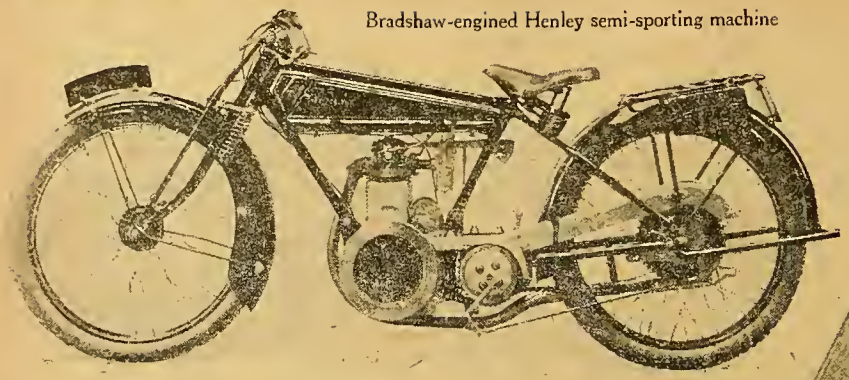
Furthermore, there is a new 347 c.c. machine to attract the man who considers 500 c.c. too much. The engine may be described as a replica of the long-stroke T.T. unit. Two types will be shown—a roadster with footboards, totally enclosed chains and touring gears, and a sporting model with footrests, aluminium piston, higher compression, close ratio gears, and a guard over the rear chain.

The 492 c.c., two 499 c.c., 596 c.c., and 976 c.c. models remain unaltered.



Reintroduced Sunbeam lightweight, with long stroke engine of 347 c.c.

Forecast and Guide to Olympia.—



Bradshaw-engined Henley semi-sporting machine

Stand **HENLEY.**

111. 350 c.c. lightweights are the most important models bearing the name Henley, which makes its first appearance at Olympia, although by no means new to the road.

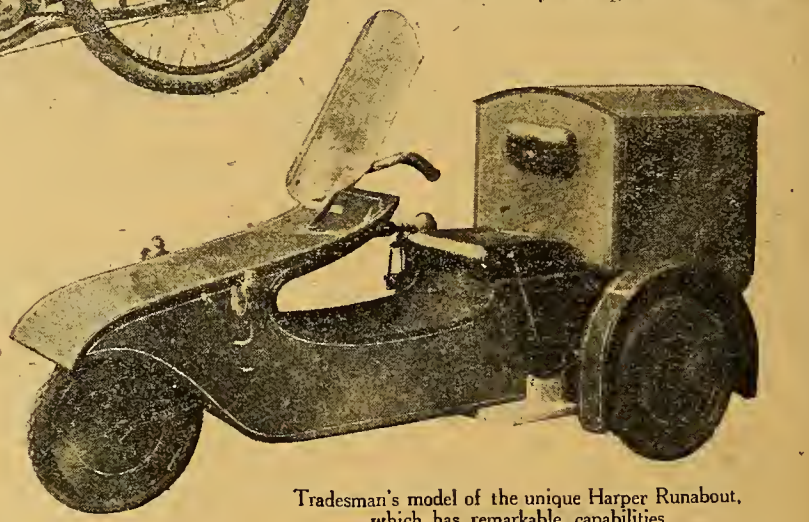
A Bradshaw-engined chain-driven machine is particularly neat.

Stand **H.B.**

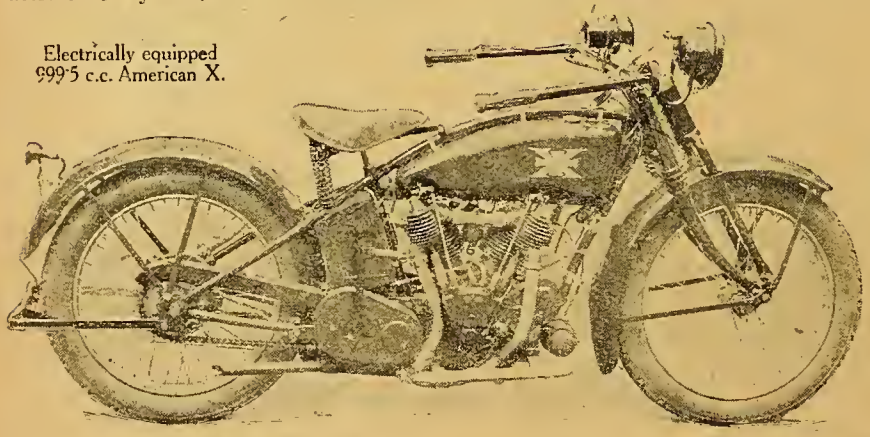
121. Three variations of one type of machine will be shown on the H.B. stand. It is a three-speed (Burman), chain-driven, 349 c.c. Blackburne-engined mount, with mechanical lubrication, internal expanding brakes on both wheels, and several like refinements in equipment and construction.

The different models are side-valve touring, side-valve sports, and o.h.v. sports.

Dunlop cord 650 × 65 mm. tyres are fitted in every case.



Tradesman's model of the unique Harper Runabout, which has remarkable capabilities.



Electrically equipped 999·5 c.c. American X.

Stand **HARPER RUNABOUT.**

122. Although the Harper runabout has been primarily designed as a tender to a car and for general knock-about purposes, its showing in the Scottish Six Days Trials was such as to cause those who witnessed it to respect it as a workmanlike, mountain-climbing touring vehicle with quite an extraordinary turn of speed.

A 269 c.c. proprietary two-stroke engine is fitted, the cylinder of which has been re-designed by the makers of the three-wheeler. Three separate chains provide three direct speeds. Detachable and interchangeable wheels are used.

Various constructional improvements have been made for 1923.

Stand **HENDERSON and AMERICAN X.**

123. Extremely moderate prices are characteristics of the Henderson and American X motor cycles for next year that should attract considerable attention to this stand.

Solo, with complete electrical equipment, the 999.5 c.c. American X is only £105; with sidecar it is £131 5s.

Similarly the four-cylinder Henderson, electrically equipped, is £137 solo and £172 with a complete sidecar—in which forms it will be shown.

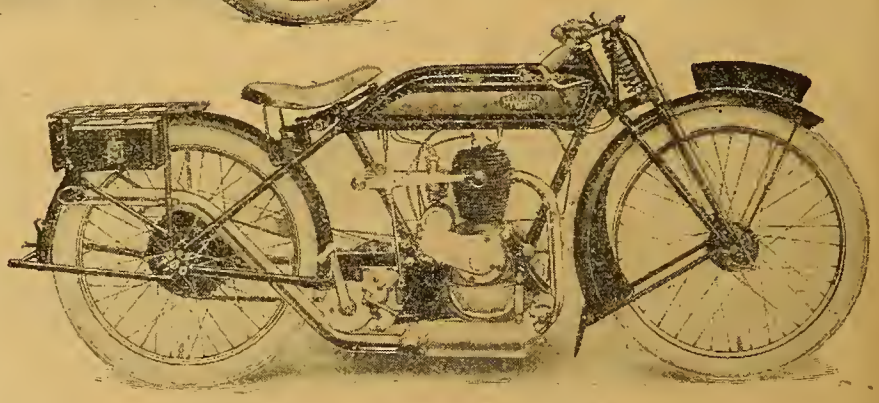
These sturdy examples of American design are now produced by the same company, and several of their parts are interchangeable, thus facilitating the distribution of spares.

Stand **COVENTRY MASCOT.**

124. Sleeve-valve (Barr and Stroud) or oil-cooled (Bradshaw) 350 c.c. four-stroke engines are fitted to the 1923 Coventry Mascots, well-proportioned solo machines embodying various gear boxes and final belt or chain transmission.

Quite a novelty on the stand will be a machine with a watersplash-proof exhaust pipe, *i.e.*, an exhaust pipe with its final and only exit in the neighbourhood of the pannier tool-bag.

(*Continued on page 764.*)



Watersplash-proof Coventry Mascot-B. & S.

SIDECARS AT THE SHOW.

The Appeal of the Proprietary Attachment. Where to see the Latest Designs.

IT is not difficult to justify the existence of the proprietary sidecar.

Despite the fact that the motor cycle manufacturer who markets a sidecar outfit almost invariably supplies the attachment as well—either his own or a proprietary make—there is a certain type of enthusiastic buyer who chooses a machine and then chooses a sidecar separately. This procedure is often followed by the very keenest motor cyclists, who like to make their own choice in all things.

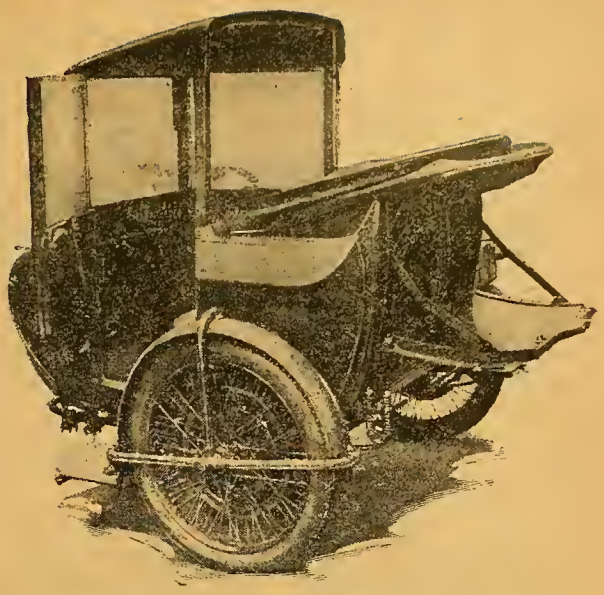
Then there is the man who already possesses a solo machine and comes to the Show to buy a sidecar for it.

An important and discriminating class is thus formed. The sidecar manufacturers, on their part, will stage a wonderful range of their products.

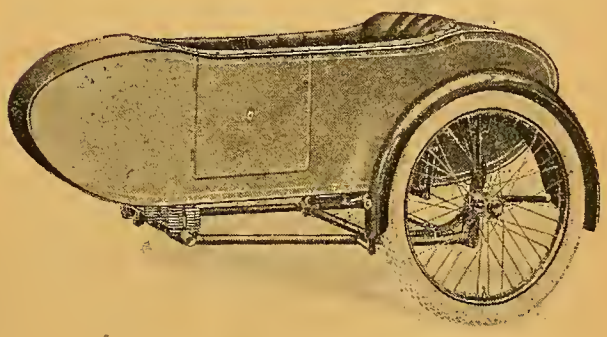
On this and the following two pages will be found representative models; ten times as many pages of *The Motor Cycle* would be required to illustrate every type, for each maker has realised that requirements in sidecars vary just as much as they do in motor cycles.

As a guide to the visitor to Olympia, the following stands are devoted wholly or mainly to sidecars, and every one of them is worth a visit:

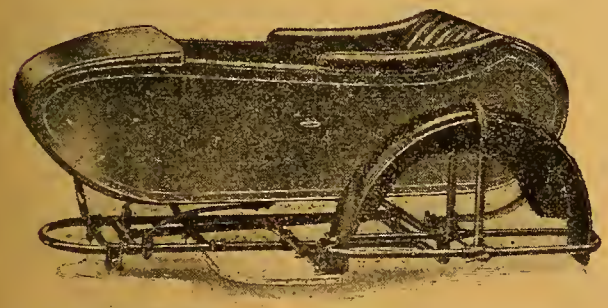
29A. Hawk.	120. Whitley.
39. Grindlay.	144. Hughes.
42. Montgomery.	163. Rideezi.
65. Millford.	165. Sheffield-Henderson.
66. Dunhill.	170. Sandum.
69. Watsonian.	180. Swallow.
113. Dorway.	



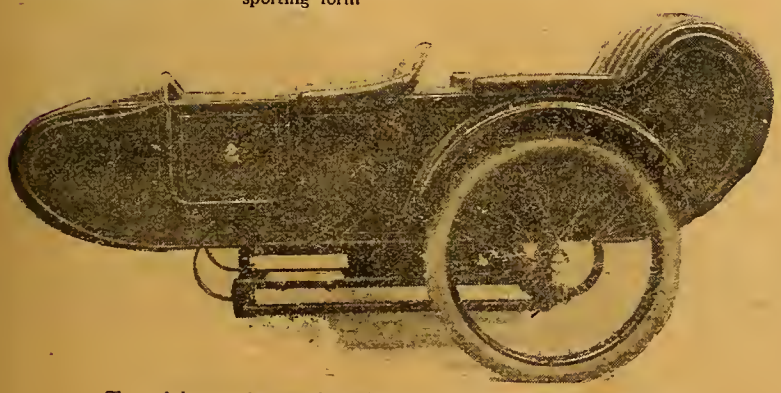
Canoelet taxi sidecar built for the County Cycle and Motor Cycle Co.



Roomy Watsonian touring model



Comfortable touring Canoelet perhaps better known to-day in its sporting form

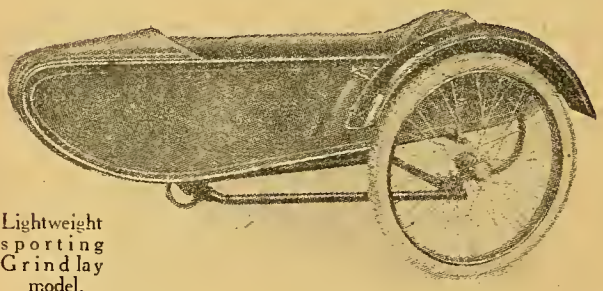


Two adults may be seated comfortably in the Millford tandem body.

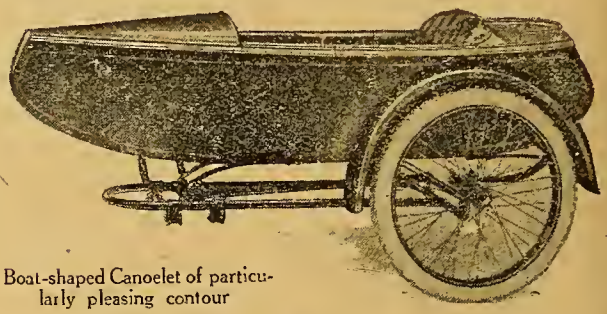
Chassis of the Dorway folding sidecar in the closed position.

PROPRIETARY SIDECARS AT OLYMPIA.

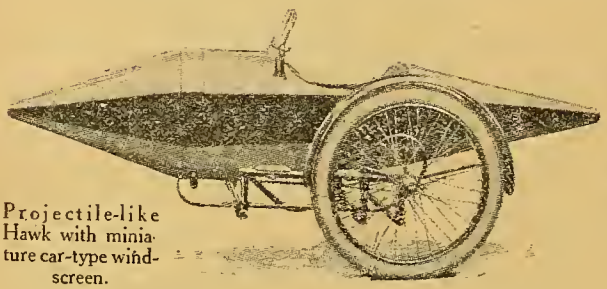
Light attachments for fast motor cycles.



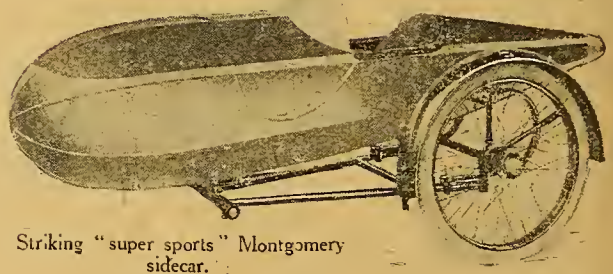
Lightweight sporting Grindlay model.



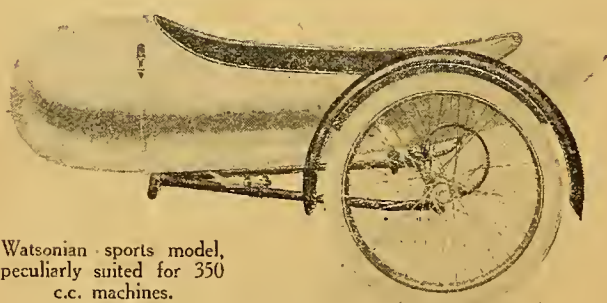
Boat-shaped Canoelet of particularly pleasing contour



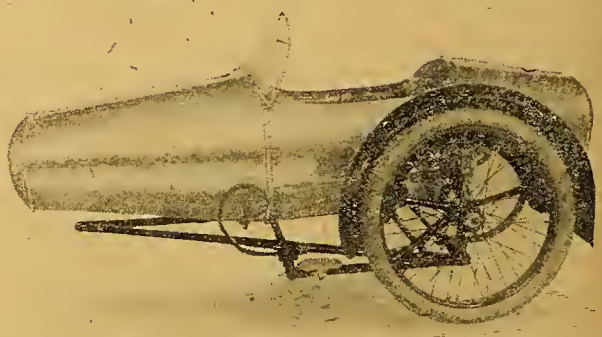
Projectile-like Hawk with miniature car-type windscreen.



Striking "super sports" Montgomery sidecar.

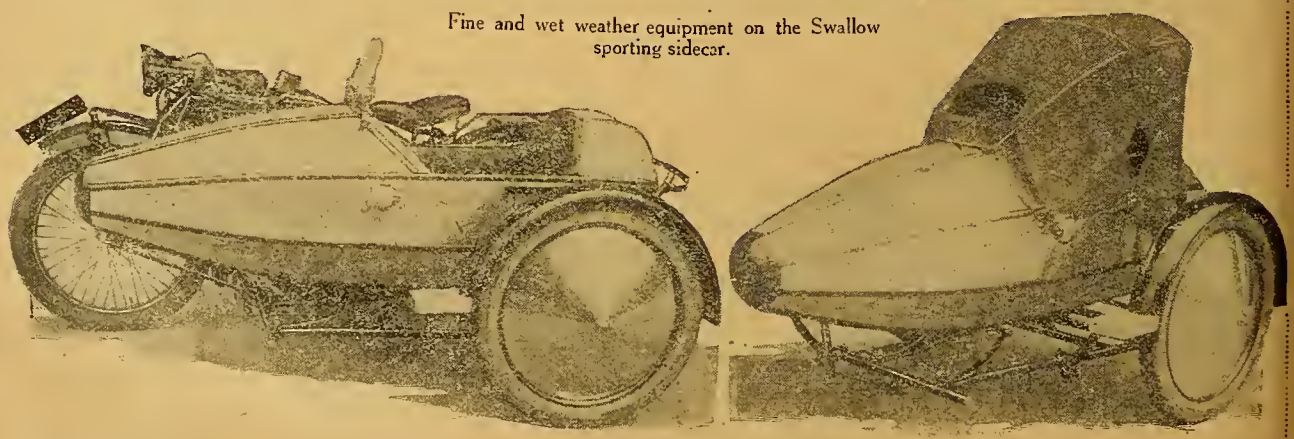


Watsonian sports model, peculiarly suited for 350 c.c. machines.



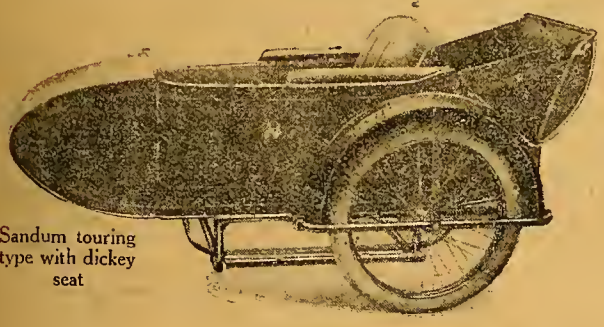
Dunhill blunted cigar-shaped aluminium body of the well-known triangulated chassis.

Fine and wet weather equipment on the Swallow sporting sidecar.

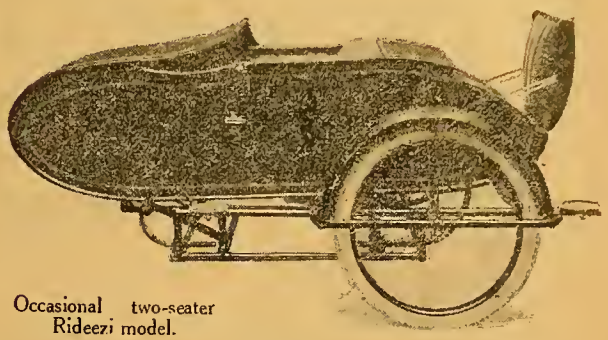


SIDECARS FOR ALL TYPES OF MACHINES.

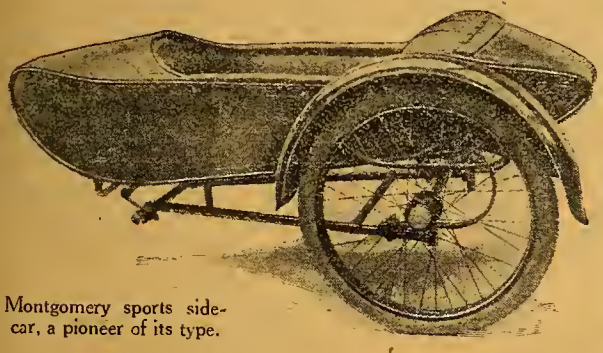
Wide Range of Models to be Exhibited at Olympia.



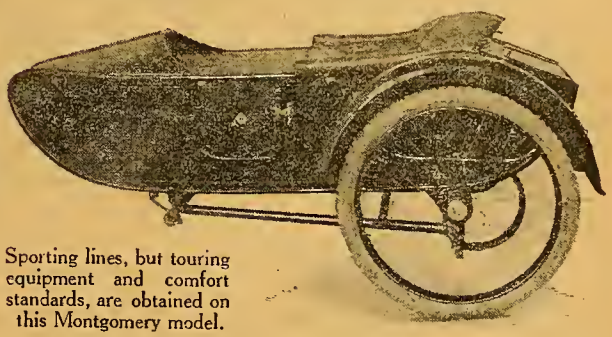
Sandum touring type with dickey seat



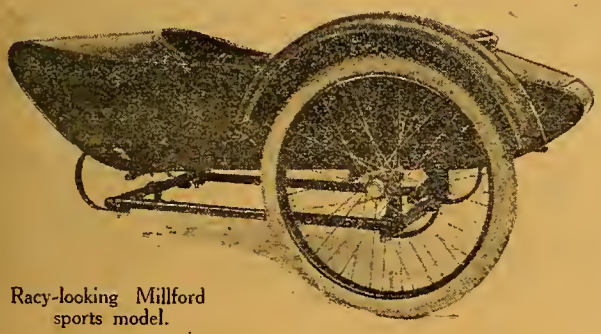
Occasional two-seater Rideezi model.



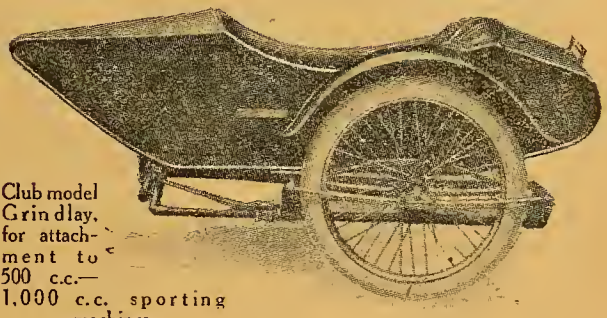
Montgomery sports sidecar, a pioneer of its type.



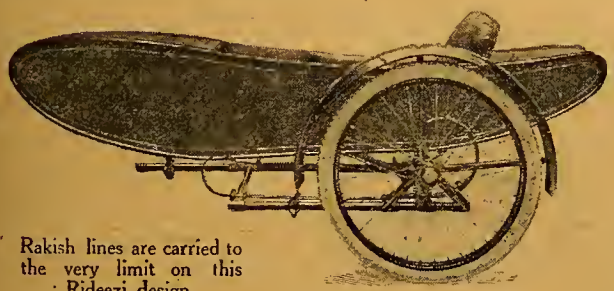
Sporting lines, but touring equipment and comfort standards, are obtained on this Montgomery model.



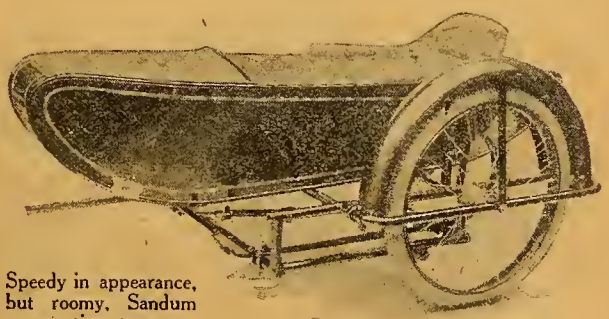
Racy-looking Millford sports model.



Club model Grindlay, for attachment to 500 c.c.—1,000 c.c. sporting machines.



Rakish lines are carried to the very limit on this Rideezi design.



Speedy in appearance, but roomy. Sandum sporting type.

Forecast and Guide to Olympia.—

(Continued from p. 760).

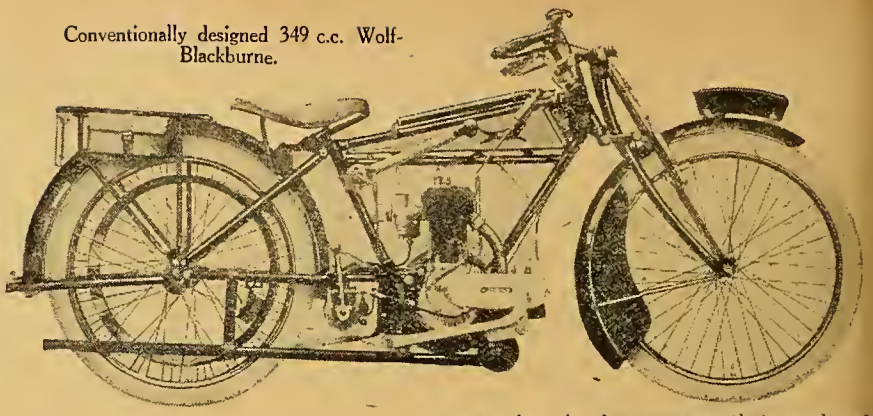
Stand. **WOLF.**

125. Seven Wolf motor cycles will be shown, ranging from a single-geared 147 c.c. Villiers-engined miniature to a 550 c.c. Blackburne-engined dual purpose mount in a solo form.

In between are 247 c.c. and 347 c.c. Villiers, 293 c.c. J.A.P., o.h.v. 250 c.c., and side-valve 350 c.c. Blackburne models, all displaying good finish for their moderate prices.

Well-known component gear boxes, etc., are used in every case.

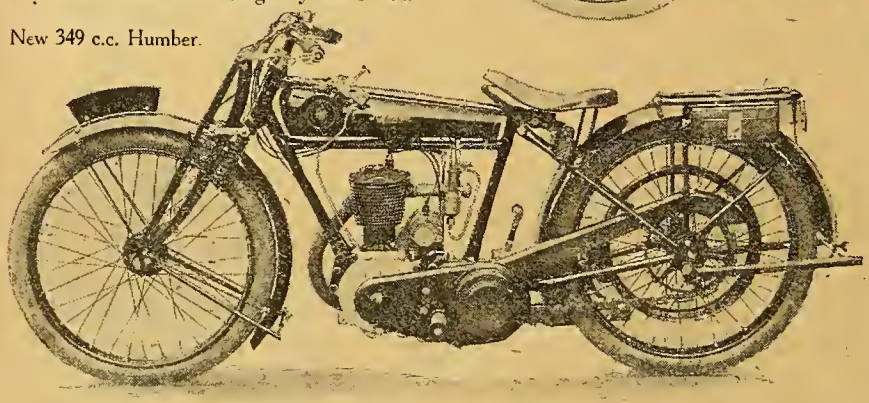
Conventionally designed 349 c.c. Wolf-Blackburne.



Stand **HUMBER.**

126. The Humber name was originally associated with single-cylinder machines, but flat twins gradually ousted the former type. The latest production once again brings Humber, Ltd., into the single-cylinder field.

New 349 c.c. Humber.



The new engine has a bore and stroke of 75×79 mm. (349 c.c.). Both valves are located at the side of the head, which is not detachable; the ports are well ribbed and have ample air spaces between the walls. Each adjustable valve tappet is operated directly by its cam without the interposition of rockers, and the tappet guides are a press fit in the timing case, being held in position by a clamp.

The Humber three-speed gear box, with clutch and kick-starter, is attached to the bottom bracket, and a positive adjustment is provided for the front chain. The internal mechanism of the gear box is the same as that employed on the well-known flat-twin Humber, which will also be shown.

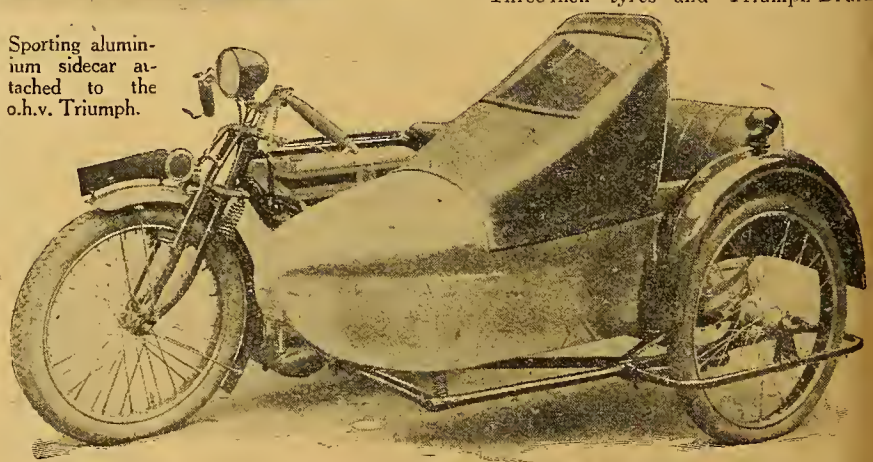
Stand **TRIUMPH.**

128. One of the novelties of the year is the new unit engine and gear box 350 c.c. Triumph, and, although deliveries will not commence until April, it is certain to attract much public attention. To say that it bristles with clever engineering design is not to exaggerate.

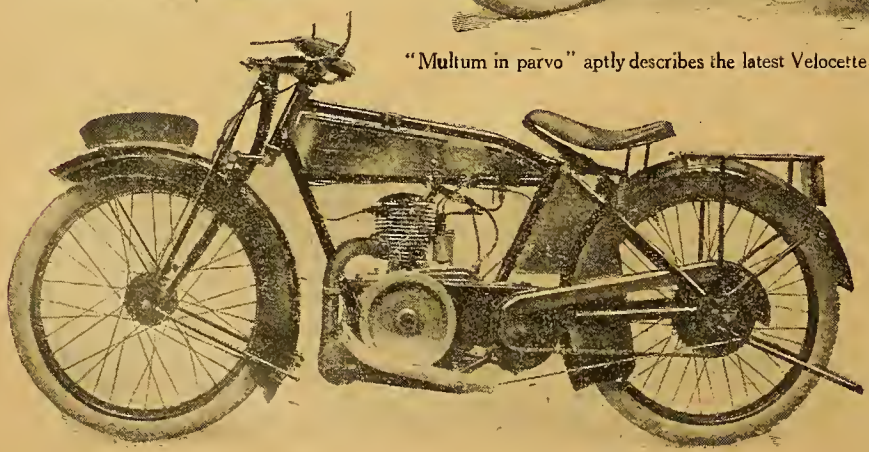
One or two small but important modifications have been made to the 499 c.c. four-valve fast touring machine, and a particularly attractive sporting sidecar has been designed for it.

Three-inch tyres and Triumph-Druid forks are now fitted to the 550 c.c. chain-driven machine, and the two-stroke has an increased engine capacity and a clutch and kick-starter.

Sporting aluminium sidecar attached to the o.h.v. Triumph.



"Multum in parvo" aptly describes the latest Velocette.



Stand **VELOCETTE.**

129. Those interested in two-stroke design should make a point of inspecting the latest Velocette engine, which has been re-designed on the lines of the record-breaking and T.T. machines.

Two separate exhaust ports of a shape that allows a gradual escape of the gases are spaced widely apart in the cylinder wall, a cooling draught of air thus impinging on what is normally the hottest point.

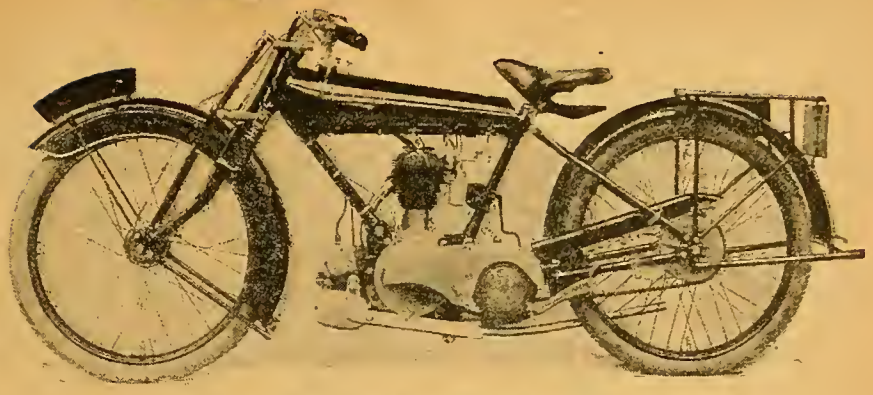
Attention has also been given to the matter of silence, and all the silencer joints are particularly carefully made to prevent leakage. Mudguarding has been further improved.

Fo-ecast and Guide to Olympia.—

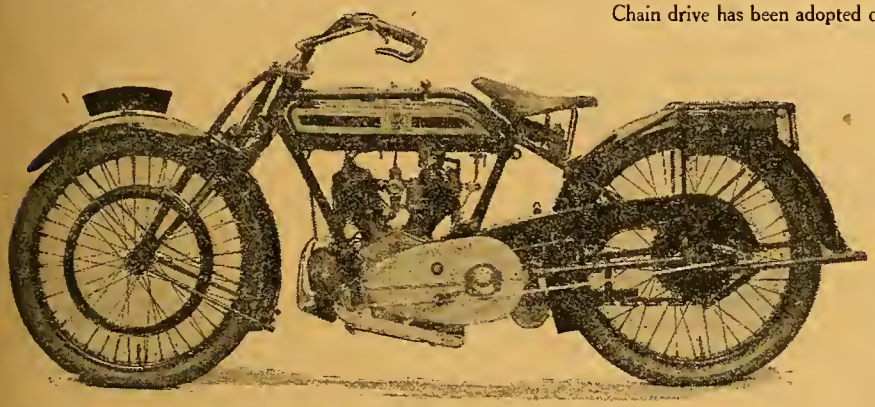
Stand. **HAZLEWOOD.**

130. Possessing an old-established reputation for sturdiness, Hazlewood motor cycles are typical of the better class of makes using proprietary components in a sensible manner, but employing parts to the firm's own design when this course appears advisable.

Lightweight solo machines and medium weight and heavyweight twin sidecar outfits will be shown. J.A.P. engines are used in every case, and chain-cum-belt or all chain transmission is employed according to price. Two *de luxe* sidecar outfits retain the well-known Hazlewood spring seat pillar and have well-designed rear internal expanding brakes.



Chain drive has been adopted on the Hazlewood lightweight.



No great change has been made to the 654 c.c. V-twin Rover-Jap

Stand **ROVER.**

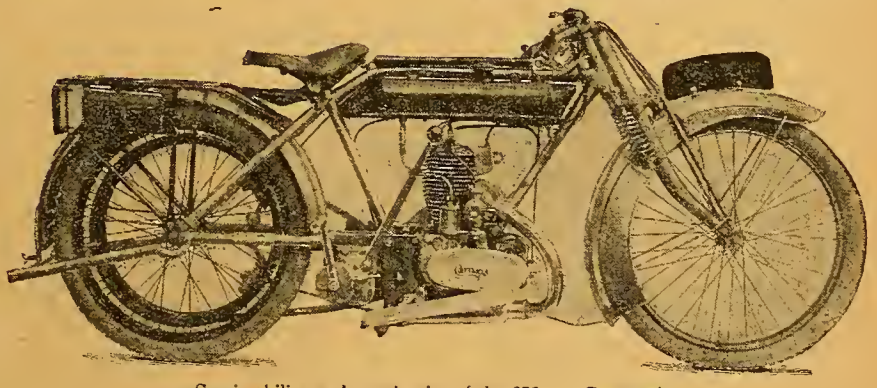
131. Although a very novel Rover model will make its first appearance at the Show, we are not at liberty to disclose details until next week. Few changes of importance have been made to the 654 c.c. twin or to the 499 c.c. single.

Stand **CONNAUGHT.**

132. Various modifications and improvements have been made to the two-stroke Connaught, which is one of the pioneers of its class, and therefore worthy of close attention.

Special cast aluminium exhaust manifolds have been designed for the standard and the sporting 348 c.c. engines, and the silencing arrangements on both are thoroughly adequate. Brake operation has been made more easy, and lubrication, by a Showell mechanical pump, has received careful attention regarding the internal distribution of the oil.

A new sidecar, made by the firm, will also be staged, as well as examples of the 293 c.c. models modified in some respects like the larger machines.

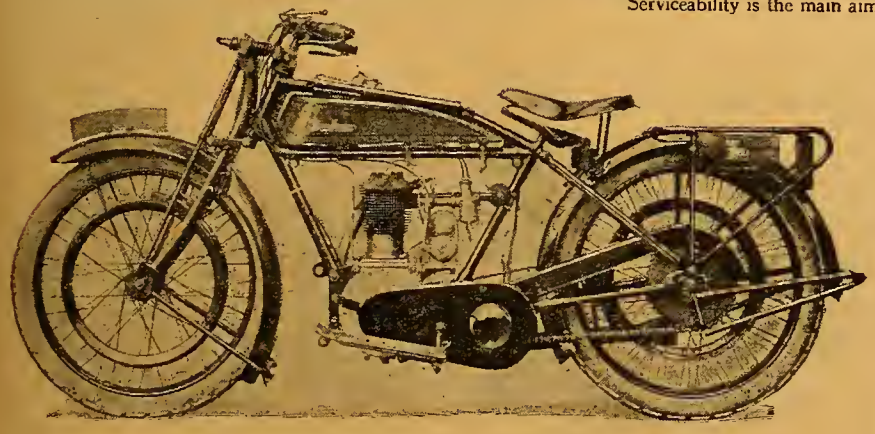


Serviceability is the main aim of the 293 c.c. Connaught.

Stand **REX-ACME.**

133. One of the first machines to adopt the 500 c.c. Barr and Stroud engine is the Rex-Acme, and a model so fitted will be staged. Externally it resembles the 500 c.c. "Impy" model which will be shown as a sidecar outfit.

Other Rex-Acmes employ 350 c.c. B. & S., 250 c.c. and 350 c.c. Blackburne, and 239 c.c. J.A.P. engines. Chain transmission is standard except on the two smallest machines and on a new two-stroke miniature making its first appearance.



Largest J.A.P. engined Rex-Acme, familiarly known as "Impy."

THE MOTOR CYCLE

SHOW REPORT.

Next week's issue will embody a complete report of the Annual Olympia Motor Cycle Exhibition Line drawings by our own artists and photographic reproductions will be a feature of an enlarged issue full of interest.

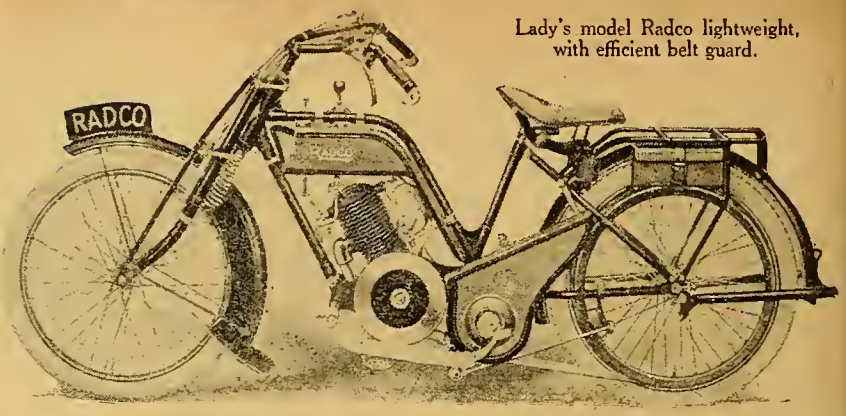
ORDER YOUR COPY TO-DAY!

Forecast and Guide to Olympia.—

Stand **RADCO.**

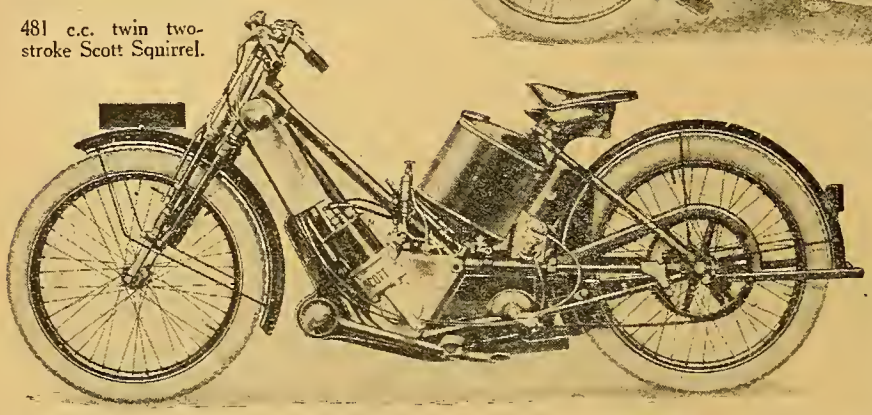
135. Two interesting departures have been made by the manufacturers of the Radco two-stroke. Chain drive has been adopted for the sporting model, and a spring frame of somewhat unusual action has been designed. With disc wheels and an external contracting brake the 247 c.c. sporting model is a workmanlike product, embodying many years' experience in the construction of two-stroke lightweights.

Wider mudguards, foot-boards instead of footrests, and a brake improvement are the chief changes on the belt-driven machines.



Lady's model Radco lightweight, with efficient belt guard.

Various forms of transmission, from direct belt drive and single gear to all-chain drive with a three-speed box, are offered, and the prices are moderate.



481 c.c. twin two-stroke Scott Squirrel.

Stand **SCOTT.**

136. For years Scott enthusiasts have been asking for a three-speed gear, and although the water-cooled two-stroke twin "pulls" very well on a comparatively high ratio, the request was probably justifiable from the sidecarists.

Next year the standard 532 c.c. Scott will be definitely obtainable with a three-speed gear, but the 481 c.c. Squirrel remains very much as before. However, the performance of the latter machine in the T.T. (when it finished 3rd and 4th) proved that there is not much to complain about with it in its standard form. The new three-speed model is described fully elsewhere.

Stand **SPARKBROOK.**

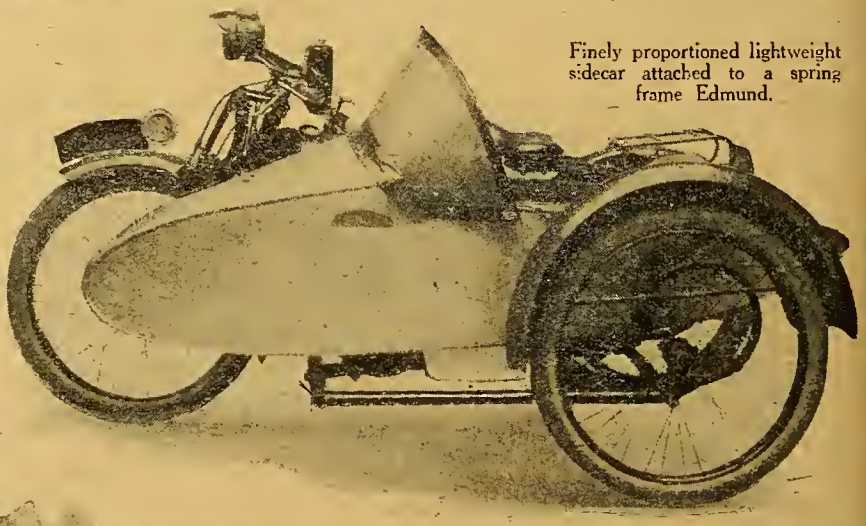
137. 250 c.c. and 350 c.c. lightweights are the speciality of the Sparkbrook Manufacturing Co.

Four well-known proprietary engines are employed in the various models—247 c.c. and 347 c.c. Villiers, 348 c.c. super-sports J.A.P., and 349 c.c. sleeve valve Barr and Stroud.

Stand **EDMUND.**

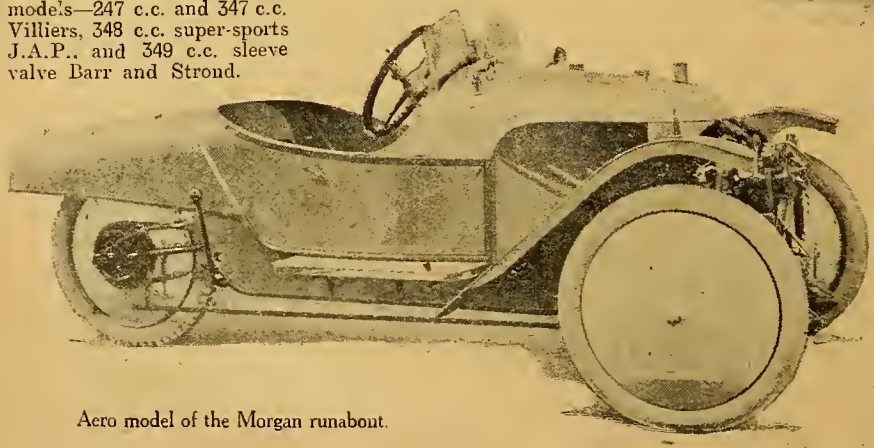
138. The Edmund has a system of suspension which gives the advantages of a spring frame without many of its disadvantages. Only the rider is sprung, the saddle and footboards or footrests being inter-connected and free to move up and down against a long leaf spring.

Extreme neatness in appearance is a feature of the design that makes the Edmund one of the handsomest lightweights of to-day.



Finely proportioned lightweight sidecar attached to a spring frame Edmund.

Side-valve and o.h.v. Blackburne engines are chiefly used, and a very attractive sporting sidecar outfit will be staged.



Aero model of the Morgan runabout.

Stand **MORGAN.**

139. There is little need to comment on the Morgan, which is practically unchanged for next year—except in price. It occupies very nearly a class by itself, and its owners are almost invariably enthusiasts regarding its capabilities.

1923 prices have been announced as follows: Standard, £135; *de luxe*, £155; family, £165. Water-cooled Morgans, including the racy-looking Grand Prix type, cost slightly more, the prices enumerated being for air-cooled J.A.P. or Blackburne engines.

Forecast and Guide to Olympia.—

Stand **OMEGA.**

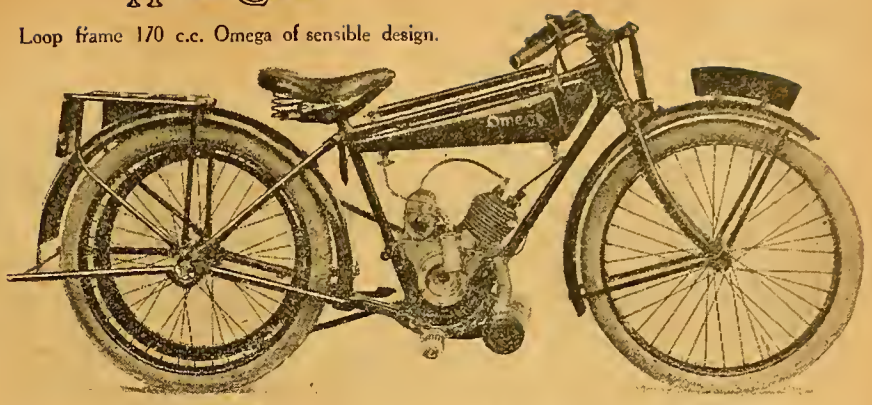
140. Quite one of the most attractive of the heavy 1923 crop of miniatures is the 170 c.c. Omega, which has a well-designed two-stroke engine, made by the manufacturers of the machine. Two examples will be staged, one with a two-speed gear box and clutch.

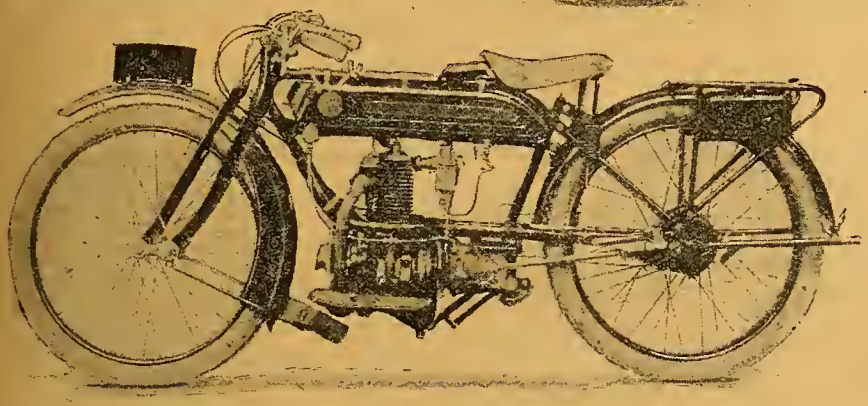
Four of the now well-known 350 c.c. duplex-frame two-stroke lightweights, one with a suitable sidecar, will also be on exhibition, the points of difference being in gears and transmission.

Finally, there will be a 292 c.c. J.A.P.-engined utility mount.

Prices, solo, range from £25 to £69.

Loop frame 170 c.c. Omega of sensible design.





286 c.c. F.N., with transversely set engine and shaft drive.

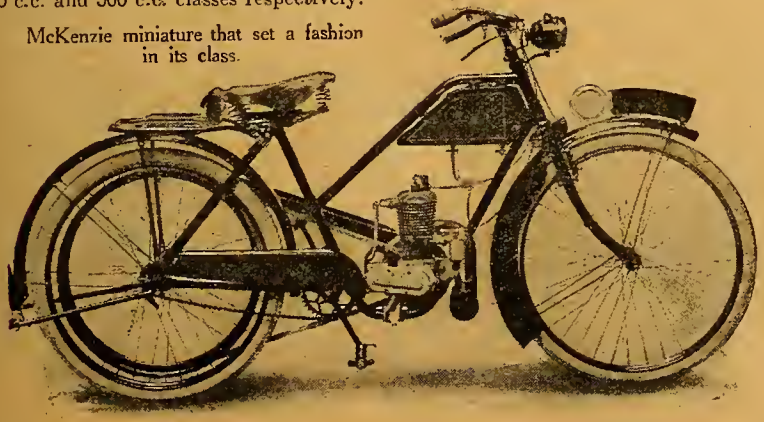
Stand **F.N.**

141. Built in one of the largest continental small-arm factories, F.N. products are famed for their excellent design, good material, and lasting qualities. The 748 c.c. four-cylinder is a machine which is built entirely on car lines, equipped with an engine which was entirely re-designed last year, and includes the very latest car practice, such as overhead inlet valves and mechanical lubrication. The single-cylinder 286 c.c. model, the engine of which is placed across the frame, also has propeller shaft transmission, and remains unaltered.

Stand **NEW HUDSON.**

142. Extending from a 211 c.c. two-stroke to a 1,098 c.c. three-wheeler of advanced design, the New Hudson range has been made still more representative by the introduction of two solo singles in the 350 c.c. and 500 c.c. classes respectively.

McKenzie miniature that set a fashion in its class.



The engines of the new models are designed for efficiency with long life, and have plain bearings throughout. An interesting constructional detail is that the oil and petrol tanks are entirely separate members. Neatly guarded chain transmission, *via* a three-speed gear box, is employed, and internal expanding brakes are fitted to front and rear wheels. In appearance both models, which are very much alike, leave little to be desired.

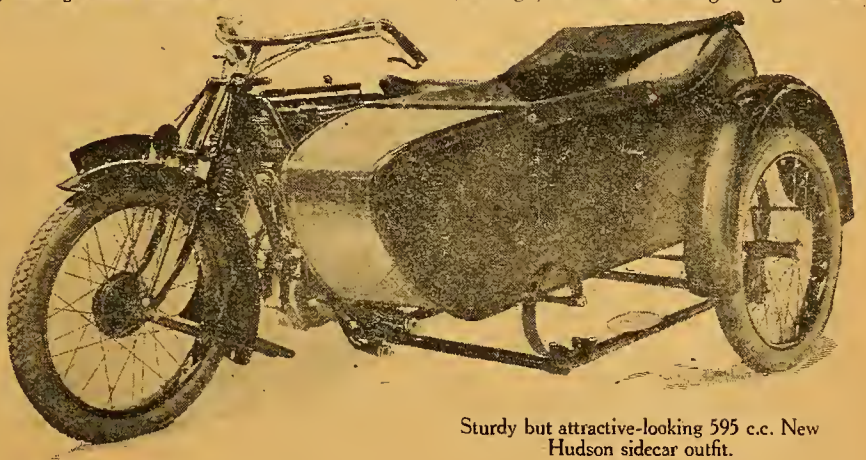
One or two detail refinements (including a new silencer) have been made to the popular 595 c.c. sidecar, which is now additionally obtainable in an attractive sporting form.

Stand **McKENZIE.**

145. Introduced almost exactly a year ago, the McKenzie lightweight made its first appearance before the public in an A.C.U. observed trial, in which it acquitted itself creditably. Since that time it has increased enormously in popularity.

Several modifications have been made to this model as a result of experience obtained during the past year with a very large output. Among these is an improved frame, which, however, is still of the loop type; it is more convenient for lady cyclists.

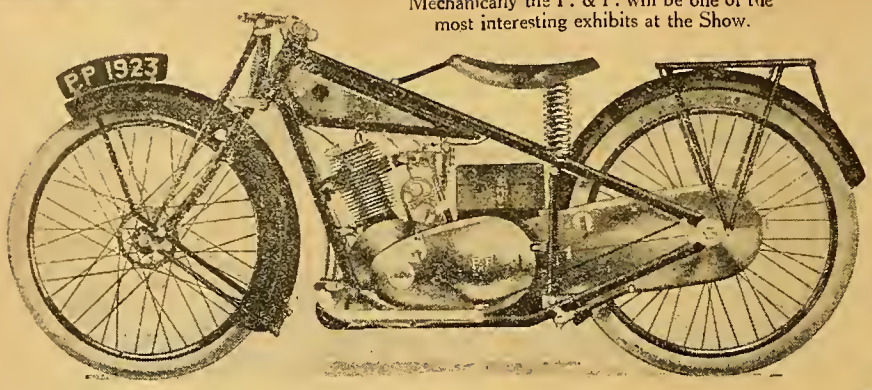
A new McKenzie has been designed fitted with the same 169 c.c. engine, but built on true motor-cycle lines. This engine is built into a motor cycle frame with a straight top tube, has a two-speed gear box, Druid forks, 24×2 in. tyres, weighs 120 lb., and costs £33 18s. complete with all accessories.



Sturdy but attractive-looking 595 c.c. New Hudson sidecar outfit.

Forecast and Guide to Olympia.—

Mechanically the P. & P. will be one of the most interesting exhibits at the Show.



Stand **P. & P.**

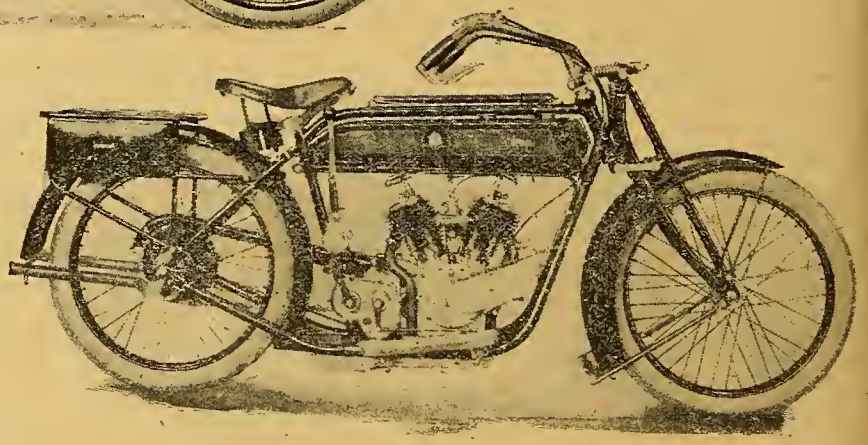
146. There are at least as many details of interest on the P. & P. as on any other machine in Olympia. Briefly, it may be summarised as an attempt, and apparently a successful one, to make an absolutely silent and completely protected motor cycle.

A Barr and Stroud engine and a Sturmey-Archer gear box are employed, but otherwise the design—duplex frame, revolving back axle, etc.—is quite original.

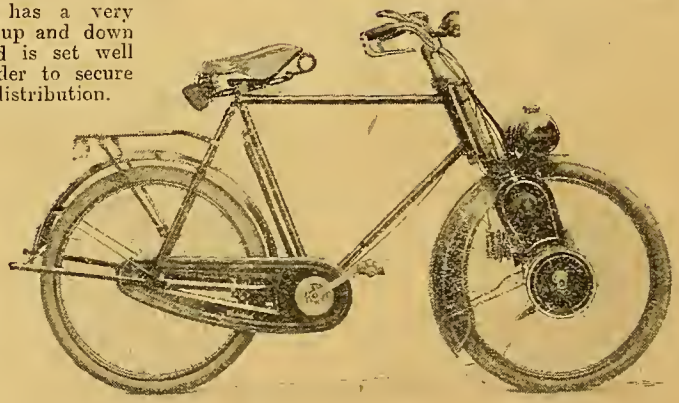
Side-shields may be fitted entirely hiding the engine, and mudguarding, saddle suspension and riding position have received careful attention.

Internal expanding brakes are fitted front and rear.

The saddle has a very wide range of up and down movement, and is set well forward in order to secure good weight distribution.



Italian built 600 c.c. V-twin Bianchi, with primary gear drive.



Cykelaid motorised front wheel on a standard pedal cycle.

Stand **BIANCHI.**

156. It is not often that British motor cyclists have the opportunity of studying Italian motor cycle design, but this year they will have a chance of inspecting the Bianchi, which is the production of one of the leading motor car manufacturers of that country.

Unit construction is a feature of this interesting machine; there are two models, a 600 c.c. twin and a 488 c.c. single-cylinder.

Stand **CYKELAID.**

158. By no means an entirely new and untried design, the Cykelaid motor attachments for pedal cycles with reappear at Olympia in a revised form. The complete unit consists of a specially built front wheel and spring forks, carrying a 55×56 mm. two-stroke engine, the whole to replace the forks and front wheel of an ordinary pedal cycle. Transmission is by chain, and a cork insert clutch is provided.

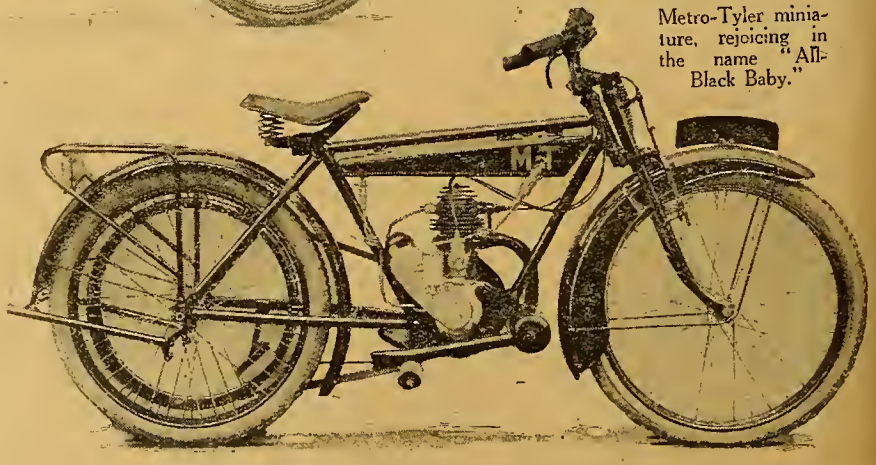
There is a good deal to be said in favour of this method of motorising a pedal cycle. It is simple and strong enough to stand its own stresses; steering is good; and the rider's clothing does not come into contact with the mechanism.

Stand **METRO-TYLER.**

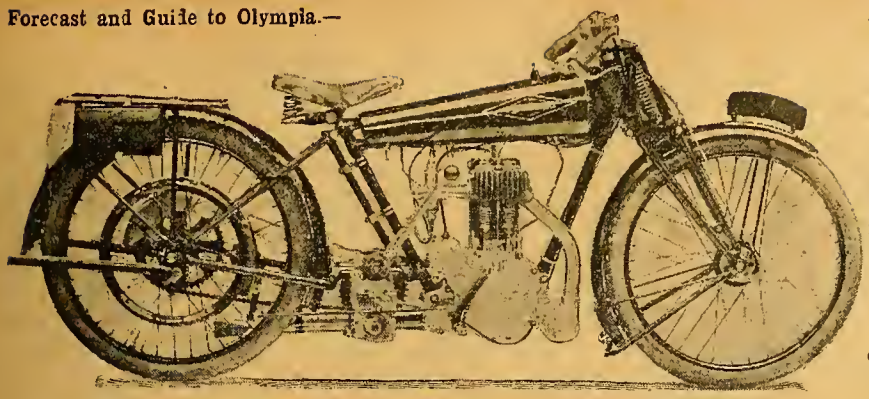
149. The makers of the Metro-Tyler are among those firms who cater for all classes of riders. In the case of the "All-Black Baby," they have designed a machine suitable for the beginner, which can be bought cheaply, is of simple design, and yet will go almost anywhere. A two-speed gear can be added at a small cost, and it can also be obtained as a sports model. All the engines are fitted with an aluminium radiator on the top of the cylinder.

The more advanced rider is catered for by the 348 c.c. Blackburne-engined machine, which can be had with either the overhead valve or side valve engine. The all-enclosed Metro-Tyler two-stroke is still retained, as well as the 698 c.c. Blackburne-engined twin.

Metro-Tyler miniature, rejoicing in the name "All-Black Baby."



Forecast and Guide to Olympia.—

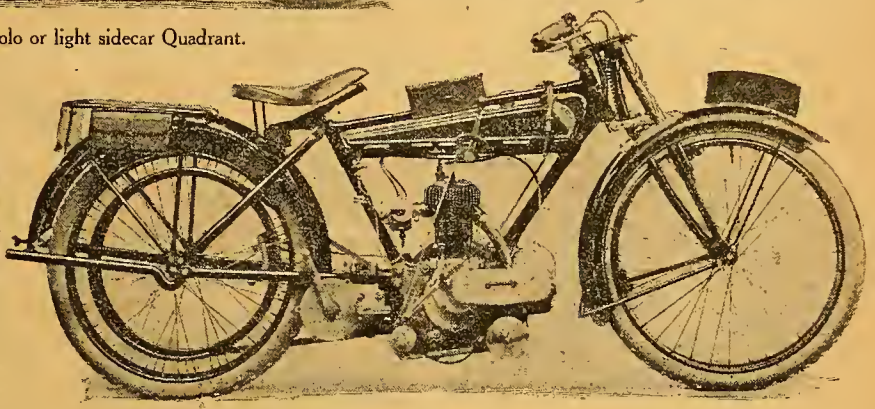


Semi-sporting 490 c.c. solo or light sidecar Quadrant.

Stand **QUADRANT.**

161. Perhaps the most interesting Quadrant is the new 490 c.c. single-cylinder model, introduced in early October. This machine, which is of pleasing appearance, has a side-by-side valve engine with a detachable head. Transmission is by chain *via* a Sturmey three-speed gear box. An internal expanding band brake is fitted to the front wheel, the rear brake being a fibre block working in a dummy belt rim. The price, solo, is £63, and, with a light sidecar, £80.

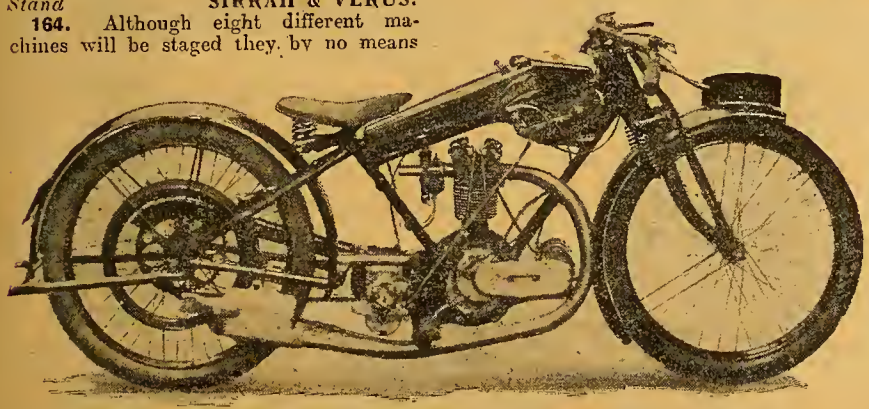
The 654 c.c. chain-cum-belt and chain-driven dual-purpose machines have been even further reduced in price, £90 being the cost of the cheapest outfit.



Conventionally designed 349 c.c. Verus-Blackburne.

Stand **SIRRAH & VERUS.**

164. Although eight different machines will be staged they by no means fully represent the very complete range of Sirrah and Verus motor cycles. None of the types shown is of a greater capacity than 350 c.c.



Guaranteed 70 m.p.h. semi-stripped 349 c.c. Sheffield-Henderson.

Bearing the Verus transfer will be a two-speed touring 349 c.c. Blackburne-engined mount and two three-speed models with the o.h.v. engine of the same make and capacity, and a side-valve 348 c.c. J.A.P. respectively.

The Sirrahs range from the 150 c.c. o.h.v. Weaver motorised bicycle to the 292 c.c. Union-engined two-stroke sidecar outfit. Excepting the miniature and a 248 c.c. Blackburne model, all the Sirrahs are two-strokes.

Broadly speaking, the Verus is the *de luxe* model of the Sirrah.

Stand **DUNELT.**

166. Chain-drive is employed in a new model of the Dunelt, a big single-cylinder (499 c.c.) two-stroke of proved capability for sidecar work. The wheelbase of the latest addition is shorter than hitherto, and the silencing arrangements have been much improved.

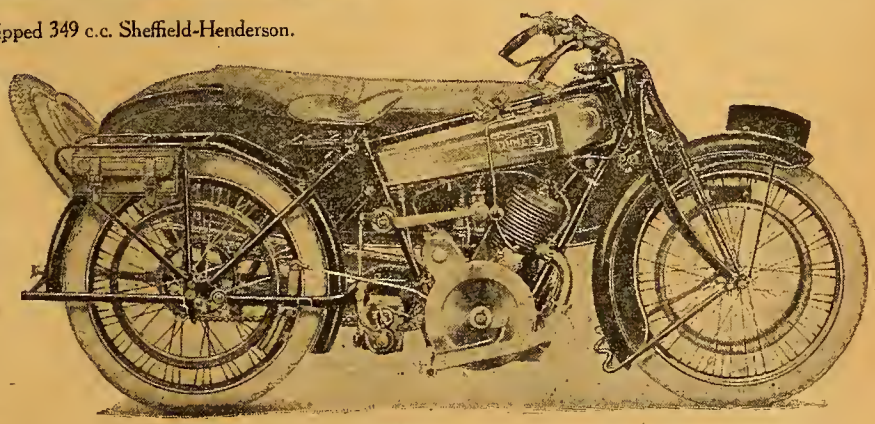
One or two modifications have also been made to the engine, which, it will be recalled, has a double diameter piston. Greater fuel economy has been obtained from a special type of Amac carburetter which also gives an appreciable increase in power.

Prices vary from £75 for the chain-cum-belt solo model to £117 for the chain-driven sidecar outfit with detachable and interchangeable front and sidecar wheels.

Stand **SHEFFIELD-HENDERSON.**

168. Successes in various speed events, including the T.T., have brought the Sheffield-Henderson very quickly into the limelight. The 349 c.c. o.h.v. Blackburne-engined model of this make was also one of the first machines to be offered with a definite speed guarantee—70 m.p.h., in this case.

Touring and sporting side valve Blackburne, sporting o.h.v. Blackburne, and dual-purpose Bradshaw models—all in the 350 c.c. class—comprise the Sheffield-Henderson range, and all have chain transmission and three-speed Burman



Chain-driven model of the 499 c.c. Dunelt two-stroke sidecar outfit.

gear boxes. Their curious but not unattractive-looking frame construction is now familiar to most people.

Stand **POWELL.**

167. Although the Powell has not competed in a great many reliability trials, it has invariably put up a good show on the occasions it has been entered—and these have usually been pretty stiff events.

The 547 c.c. dual-purpose model is now available with either final belt or chain drive, and has not undergone any radical alteration for next year.

The introduction of a 247 c.c. Villiers-engined lightweight, however, is interesting. Conventional lines are followed throughout, transmission being by chain and belt *viâ* an Albion two-speed gear box. It is also obtainable single-geared.

Stand **SCOTT SOCIABLE.**

168. As befits a design which was evolved and tested for five or six years before it reached the public, only the smallest details are likely to be altered on the Scott Sociable. During the present year the transmission has been strengthened, and an aluminium body has been adopted. For 1923 a greater ratio of engine movement to the traverse of the starting lever has been provided, and instead of the single headlamp on the front wing-cum-petrol tank, two headlamps have replaced the side lamps which were mounted on the dash. A considerable price reduction has been effected, which brings it more favourably into competition with the more elaborate sidecar outfits which it was frankly designed to replace, following as it does the layout of a sidecar outfit.

Stand **L.S.D.**

169. Hailing from Huddersfield, the L.S.D. is an exceptionally strongly constructed three-wheeler using various forms of the air-cooled J.A.P. engine in identical chassis.

A two-speed reverse gear and shaft and chain drive is employed; detachable and interchangeable wheels are used.

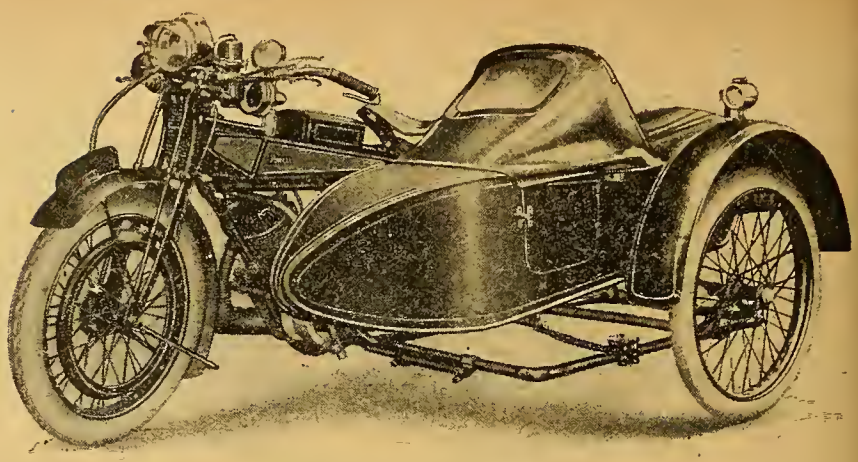
Bodywork has been considerably improved for next year, and a family model has been added to a range that now meets every need.

THE MOTOR CYCLE

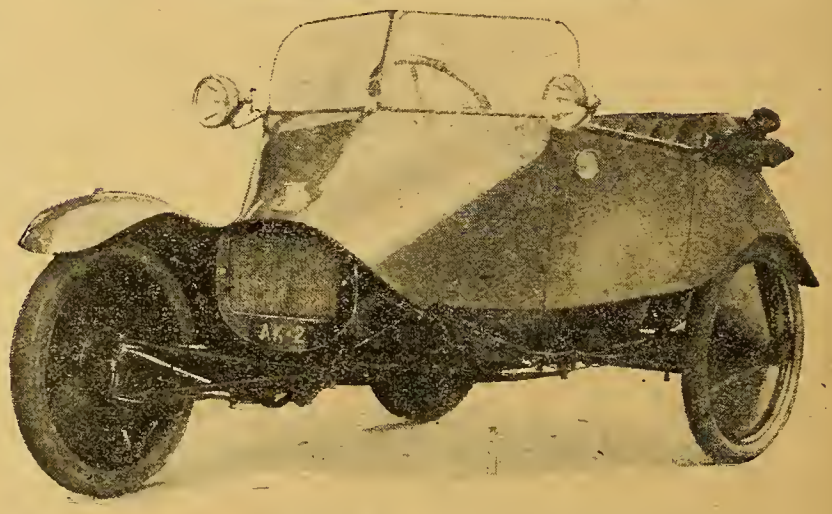
SHOW REPORT.

Next week's issue will embody a complete report of the annual Olympia Motor Cycle Exhibition. Line drawings by our own artists and photographic reproductions will be a feature of an enlarged issue full of interest.

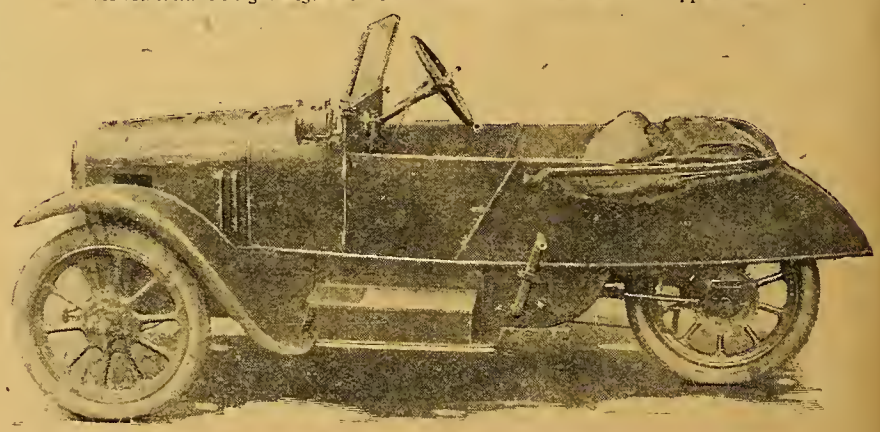
ORDER YOUR COPY TO-DAY!



Completely equipped 547 c.c. Powell sidecar outfit.



Viewed from the right angle the Scott Sociable is not unattractive in appearance.



Family model of the L.S.D.

IMPROVEMENTS TO THE PARAGON FOLDING SIDECAR.

INVENTED in 1912 and exhibited at Olympia in 1913, the Paragon folding sidecar has had continued success.

The demand has steadily increased year by year, for more and more motor cyclists wishing to avoid garage fees and keep their machines at home, are turning to the folding sidecar as a solution to their problems.

Important improvements have been made in the attachment of the body to the chassis. It is fitted almost instantaneously and requires the least amount of effort. When attached it is held securely by trigger bolts in a rigid rectangular frame which serves to stiffen the collapsible portion and to hold it securely without fear of rattle.

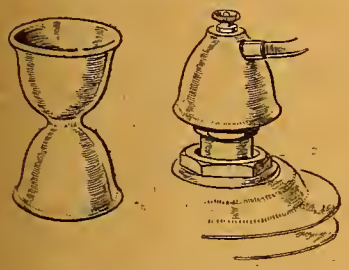
IDEAS: USEFUL AND INGENIOUS.

A Selection of our Readers' Home-made "Gadgets," with Practical Hints on Work in the Garage and on the Road.

Umbreilas for Sparking Plugs.

WHETHER "Notron," who submits this idea got his inspiration after a raid on the kitchen or whether he came by it and the materials in a visit to the domestic bazaar, is unknown, but it is quite good.

Briefly, this reader suffered from water on the high-tension terminal and insulation of his sparking plug, and so devised a plug cover from one of those spun aluminium egg-cups which consist of two similar hemispherical pieces joined together. The sketch is itself explanatory, and only one half the egg-cup was used. "Notron" found that this cured his troubles, and also kept the plug electrode cooler by conduction and radiation; what a pity he couldn't sign himself "Nagrom" or "Salguod," and so use both halves of the egg-cup.



Part of an egg cup as a plug protector.

Removing Gummed Piston Rings.

IT is very often possible to remove the most obstinately "stuck" piston rings by the following process:—

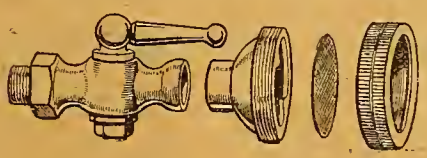
First, with the point of a pocket knife, remove as much carbon as possible from between the split of the ring; then heat the ring and piston by playing on it with a small flame from either a gas blow-pipe or a petrol blow-lamp. Care should be taken to heat the ring uniformly all round by applying the flame with a continuous motion all along the surface of the ring; when the ring and piston have reached such a temperature that they are *just uncomfortable* to handle, immerse in a bath of paraffin. It should now be possible with a narrow knife point to raise one end of the ring by inserting the knife blade between the slit and prizing gently outwards. Immediately the ring shows a tendency to move repeat the heating process, but with the variation that the flame should only be applied to that portion of the ring immediately adjacent to the end which has been raised; on reaching the temperature already referred to, apply paraffin from a small oilcan through the slit so that it reaches the back of the ring; again with the knife prize the ring up a little farther; it should then be possible to insert a small strip of metal between the ring and the piston. The heating and the paraffin application should still be continued and the inserted strip gradually worked right round the ring until the whole is quite free of its groove.

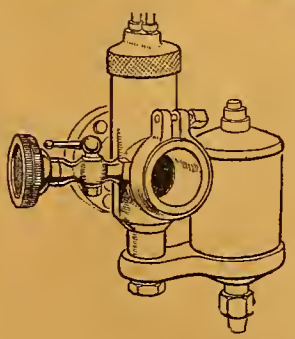
The greatest care should be exercised in working the strip forward, and under no circumstances should great force be applied, or fracture will inevitably result.

C. C. R.

Filtered Extra Air.

THE dodge of fitting a drain tap in the induction pipe to act as an extra air valve is by no means new, but "C.E.P." (Old Hill, Staffs) goes a little further with the idea. Obtaining the base of a small electric lamp-holder, he solders this on to the open end of the tap and secures a piece of gauze by the flanged ring ordinarily used to secure the bayonet socket of the fitting.



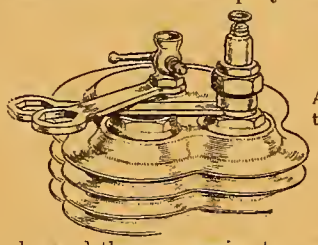


Fitting a substitute for an extra air valve.

Incidentally, there is no need to do any soldering if a tap is chosen with $\frac{1}{8}$in. gas thread, which will screw into the usual cord nipple orifice of the small bulb-holder threaded $\frac{3}{8}$in. brass; the differences in diameter and pitch of these two threads are negligible.

Resource.

TO be a long way from home and have a valve cap blow out, completely stripping its thread, is to be in a rather awkward predicament. However, "W. M.," of Tredegar, got out of the difficulty with the help of two spanners held down over the cap by the sparking plug and the compression tap respectively in the manner shown clearly in the accompanying sketch. Some compression loss was, of course, inevitable, but the main thing was that it was possible to get home under power.



An ingenious temporary repair.

Scott Tips.

THE following simple wrinkles are not yet the universal property of Scott riders:—

To replenish the frame tubes with oil in the least possible time, use a thin oil or heat a sluggish oil till it runs freely. Then use a funnel with a very narrow spout, and insert it well into the frame tube. The air present in the tubes can then escape through the filling basin, and no bubbling occurs.

To ensure a rapid start from cold next morning, stop the engine overnight by closing the air lever. This will drag lots of petrol into the crank case—so much, in fact, that a quick restart the same night is practically impossible.

In the event of a Scott engine refusing to start when hot from excess of petrol (*e.g.*, if the carburetter has stupidly been flooded with the engine warm, or if engine, when warm, was stopped as described above), take out the carburetter slides and operate the kick-starter to exhaust the rich mixture inside the engine and replace it with air. As soon as the engine fires, use the cut-out to stop it, replace the slides, and all will be well. The special difficulty of "ventilating" a two-stroke engine lies in the fact that its cylinders are very slowly and imperfectly scavenged by turning the engine round when it is not firing.

When adjusting chains get the tension on the high gear side correct; an enormous amount of slack is permissible in the low gear chain, and there is no fear of it jumping the sprockets.

"HINTS AND TIPS FOR MOTOR CYCLISTS"—gives hundreds of useful "wrinkles." Price 2s. 3d. post free from "The Motor Cycle" Offices, Dorset House, Tudor Street, London, E.C.4.

INSURANCE PROBLEMS

A Special Feature in which Insurance Questions are Answered and Discussed.

It is now generally accepted that insurance is a vital necessity in the case of every motor cyclist. The number of communications received on insurance matters, too, indicates that readers are very keenly interested in this subject; some of the questions require expert advice, and this feature has been formed to deal impartially with the various problems that are presented to us.

The close associations of "The Motor Cycle" and our sister journal, "The Autocar," with the Autocar Fire and Accident Insurance Co., Ltd. (a company evolved from the old Autocar Insurance Department, founded 18 years ago) enable "The Motor Cycle" to keep in very close touch with all matters pertaining to insurance—an undoubted advantage to our readers.

Enquiries will be welcomed and should be marked "Insurance" on the left-hand corner of the envelope and addressed to "The Motor Cycle," Dorset House, Tudor Street, E.C.4.

Unlicensed Rider. A reader from Bristol asks whether an insurance company would pay for damage to a motor cycle and compensation to third party if the machine, ridden by an unlicensed rider, was fully insured.

The ordinary motor cycle policy would not indemnify the owner in the event of an accident occurring whilst the machine is being driven by an unlicensed person.

* * * *

Blowing off the Cylinder Head. N. Wallace, Long Eaton, on the question of mechanical breakdown, says: "Recently a friend of mine had the misfortune to blow the cylinder head off his engine. It happened that he was not insured, but if a similar thing occurred to a person who was insured, under what clause would this accident be stated?"

The accident as described would not be considered as coming within the cover granted by the ordinary insurance policy, the damage coming under the heading of "Mechanical Breakdown," which is excluded. It will be realised that an insurance policy is not intended to guarantee the machine withstanding the ordinary running strains.

* * * *

Excessive Charge. An Ashbourne reader writes: "On the 17th of August I filled up a proposal form with a view to insuring my 650 c.c. motor cycle. The price of the premium was £7 16s., myself paying the first 50s. of any accident. Shortly after the 13th of September, before any policy or any further communication came to hand, I wrote cancelling the insurance because owing to financial pressure I was unable to meet the cost. In reply the insurance company wrote asking payment of £3 16s. 6d., due, it was stated, because I was covered from the date I filled up the proposal form until I wrote cancelling it. Is the company entitled to this amount?"

If you completed and signed a proposal form for an insurance and received a cover note or some intimation that the insurance was agreed in force, we should say that the full amount of the premium is then due to the insurance company, but if at a later date you wished to cancel the insurance effected, the company would appear to be entitled to charge for the time on risk, according to its advertised prices for short term policies. As, however, you do not give the name of your company, we are not able to advise you as to whether the amount demanded is on the above lines. If you did not receive any cover note, or acknowledgment of your proposal form, we do not consider that the insurance company would have been responsible to you in the event of an accident, and therefore it can have no claim for payment of the premium.

Deferred Payments. Frederick Jones, New Brighton, raising a query on deferred payments, writes: "I bought on the deferred payment system a 269 c.c. outfit, and deposited £28, which included £6 10s. for insurance. I would be very glad if you could let me know for how long my machine is covered, and what risks, as I have no records here. I am still paying instalments."

We cannot give you the information required without seeing either the policy or the cover note in respect of the insurance, but from the amount of the premium it would appear that the insurance is probably a "Comprehensive" one for twelve months. In a case of purchase on deferred payment system, the original or the duplicate of the policy should be sent to the purchaser, and we suggest that you make an application for a duplicate in order that you may see exactly how you are insured.

* * * *

Refusing Liability. "E.B.", of Erith, on the question of liability, writes: "I met with an accident whilst riding my sidecar, and in sending a claim to the insurance company, stated that my handlebars had shifted whilst rounding a bend in the road. The company refused to accept liability, on the ground that the accident was a mechanical breakdown. Would you advise me as to my position? Also, when the policy was issued a mistake in the number was made. I informed the company of this three times, and after a delay of five weeks was informed that I had been running under a false registration, which is contrary to the rules of the policies; therefore, the policy is valueless. The company now wants to cancel the policy. Could you tell me if I can claim back my years' premium, considering it was not my mistake that rendered the policy valueless?"

You do not state the nature of the accident which occurred, or any particulars of the damage caused, but if your machine came into collision with some object, or was overturned, the damage resulting therefrom would be covered under the ordinary policy. From the second part of your letter we understand that your machine is properly registered and numbered, but that by a clerical error the number is shown on your policy in an incorrect way. If this is so, we do not consider that the company would be entitled to refuse your claim on account of the clerical error in the policy, nor can we understand any insurance office of repute taking up this attitude. If you will send us further particulars asked for regarding the accident, and at the same time forward your policy for perusal, we shall be pleased to advise you further in the matter.

CURRENT CHAT

Times to Light Lamps.

Nov. 23rd	.. ..	4.30 p.m.
„ 25th	.. ..	4.28 „
„ 27th	.. ..	4.26 „
„ 29th	.. ..	4.24 „

One number plate must be illuminated as above *vide* Road Vehicles Registration and Licensing Order (1921). According to the Lights on Vehicles Regulations (1903) the lamps ordinarily required by law may be lit half an hour later.

A Big Industry.

Over a hundred different makes of motor cycles will be staged at Olympia.

Olympia.

On Saturday Olympia again opens as a motor cycle exhibition, with more exhibitors than ever.

Scottish Motor Show Space Booked.

Already the whole of the space at the Scottish Motor Show, which opens on January 25th, 1923, has been booked up.

Refinement.

As will be seen from the forecast of the Show on pages 744 to 770, motor cycle design tends towards greater and greater refinement.

This Issue of "The Motor Cycle."

In addition to a forecast of the motor cycle, sidecar and runabout exhibits which will be at Olympia next week, this issue contains a large number of those special features which are so popular with our 120,000 regular readers.

1923 Brooklands Programme.

Five members' meetings of the B.M.C.R.C. will be held at Brooklands next year (on April 7th, May 6th, June 2nd, August 18th, and September 22nd). July 21st has been allotted for the 500 mile race, and October 20th for the usual championship meeting.

An Anglo-French Production.

The address of the designers of the Beatty-Claxton shaft-driven motor cycle, described last week, is 27, Rue de Mauheuge, Paris, 9eme. Incidentally it should be made clear that the capacity of the engine is 292 c.c., and Hyatt bearings are fitted in the gear box only.

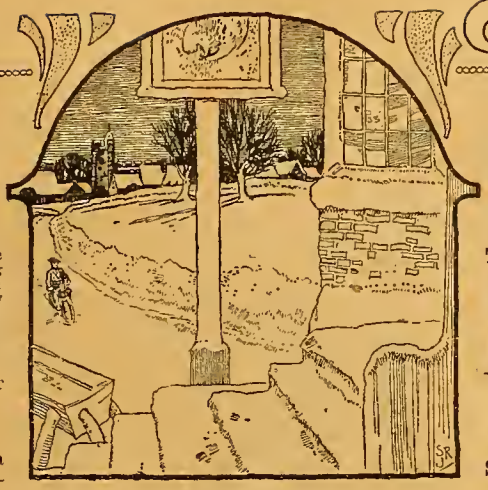
The Highway in Mid-November.

Sidecars of all sizes and all ages were on the road last week-end. Owners took advantage of the remarkable weather for mid-November, many taking out the last quarter's licence on the Saturday morning in the certain hope of at least one good day's run.

Next Week's Report Number.

The Motor Cycle complete report of the Olympia Show will appear next week, and will be on sale during the exhibition. Besides describing the whole of the motor cycle exhibits, a feature of interest will be a detailed survey of design, with graphic illustrations showing the trend. Order your copy to-day to prevent disappointment!

6-12



Motor Cyclists and Taxation.

Motor cyclists are strong in their condemnation of those who maintain that the petrol tax is an impossible proposition.

Collecting Petrol Tax.

If tax can be collected on packets of cigarettes and bottles of wine, why should there be difficulty in gathering a petrol tax?

Miniatures.

If the keen interest shown in the ultra-lightweights is any criterion, trade in these miniatures should be good next year.

Newcastle Road Repairs.

As the High Level bridge between Newcastle and Gateshead is temporarily closed an alternative route will be signposted by the Association. Patrols will be detailed for special duty from 9 a.m. to 8 p.m. The bridge is to be re-opened in about a month's time.

REAL LIGHT-WEIGHT DEMONSTRATED.

An illustration that exemplifies the ease of handling the modern lightweight—a machine quite distinct from the ultra light motorised bicycle. This little two-stroke, the 147 c.c. Rebro, will be amongst the new makes available in 1923.

Special Features.

GUIDE TO THE OLYMPIA SHOW.
OPEN LETTER TO THE TRADE.
PRE-SHOW ACTIVITY AT BROOKLANDS.

The Hero—

An aged gentleman with pedal cycle and Auto-wheel, riding down the Strand into Trafalgar Square at nine o'clock on election night.

—and His Reward.

'Bus drivers, taxi-men, newsboys, revellers, policemen, postmen, etc., with one voice: "Be-e-e-eaver!"

Show Admission Tickets.

The charge for single admission to the Motor Cycle Show, November 25th to December 2nd inclusive, is 2s. Season tickets costing 7s. 6d. can be obtained on application to the Secretary, The British Cycle and Motor Cycle Manufacturers' and Traders' Union, Ltd., The Towers, Warwick Road, Coventry.

Not Due to Alcoholism.

On being called upon for a speech at the B.M.C.R.C. dinner, after he had been presented with the Aggregate Cup for the best performance during the 1922 track-racing season, H. Le Vack said that his success must not be attributed to alcohol, which would not work on his engine as it made the pistons tight.

Competition Machine Stolen.

R. Boxer, the well-known competition rider, has had his Matchless stolen. A reward of £25 is offered by the Provident, Accident and Guarantee Co., Ltd., 61-62, Coleman St., London, E.C.2, for the recovery of the outfit, the engine and frame numbers of which are 2C9 AS63368 and J77 respectively.

D.R.s' Reunion Dinner.

3rd Army D.R.s are advised that their fourth annual dinner will be held at the Trocadero on Friday, December 1st; tickets 11s. each. Any R.E. D.R. who used to run to the section will be welcome. Particulars are obtainable from Mr. D. Jarvis, 51, The Avenue, Beckenham, Kent.

A Seasonable Change.

In order to widen the district covered by the club, the Dewsbury and District Motor Cycle Club has found it desirable to alter its title. It will, in future, be known as the Yorkshire Heavy Woollen District M.C.C. We imagine that the club will be well represented in the forthcoming London-Exeter event. [Note to comic artists: Only the very best drawings of the start of the club's winter trial can be entertained.—ED.]

D 7

147 c.c. CONQUERS BWLCH-Y-GROES.

Splendid Performance of Excelsior Lightweight Machines on Famous Welsh Hill.

DURING the past few years motor cycle designers have been devoting their energies to producing machines of light weight and small engine capacity, but none the less capable of dealing with all road conditions encountered by the average rider.

For the ultra-lightweight there exists a very extensive market, composed largely of the people who at present ride ordinary bicycles.

It is extremely difficult to convince these prospective motor cyclists that this class of machine possesses the power and stamina necessary effectively to perform the work that it will be called upon to do.

With a view to providing proof that every confidence could be placed in these Lilliputians, a very severe trial took place on Saturday, arranged by the Excelsior Motor Co., Birmingham.

A Two-Mile Hill.

Bwlch-y-Groes was chosen as the testing ground, and, to the reader who is not familiar with this famous Welsh hill, it may be stated that the total length is some two miles; the average gradient is approximately 1 in 6, and the steepest portion has a gradient in the neighbourhood of 1 in 4.

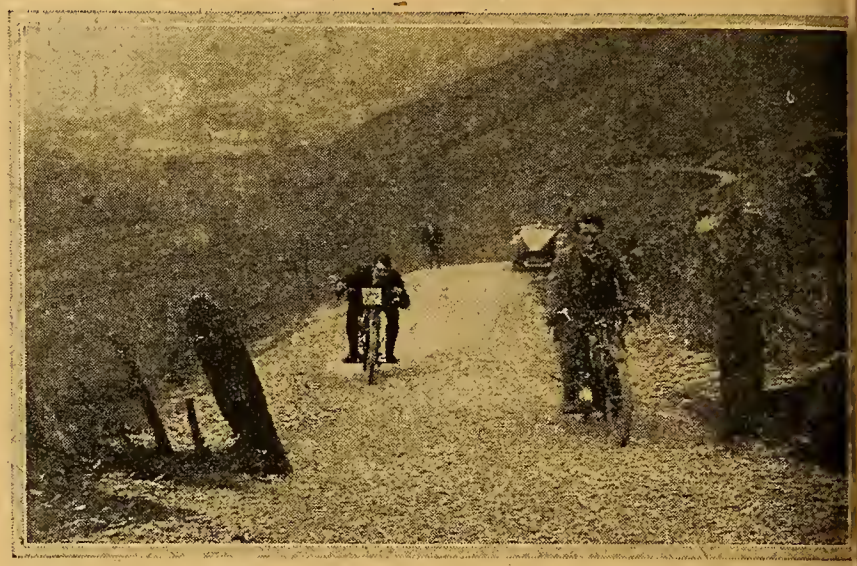
Excelsior Junior machines were those to be tested over this formidable stretch of mountain road. A Villiers engine having bore and stroke of 55 mm. × 62 mm., giving a cubic capacity of 147 c.c., supplies the power, the Villiers flywheel magneto and a Mills carburetter being fitted. A chain transmits the power to an Albion two-speed gear box, the final drive being by belt. Top and bottom gear ratios of 9 to 1 and 14¾ to 1 respectively were employed; the total weight was 112 lb.

It was hardly to be expected that so diminutive a machine would make a clean ascent of so stiff a gradient. Nevertheless, the Excelsior made no fewer than ten absolutely clean and comparatively fast climbs, and apparently it would have gone on doing so indefinitely.

It must be borne in mind that the machines were not specially tuned for the event; indeed, two of the three used had not previously been on the road. One of these had to be robbed of its piston to replace another through the top of which a hole had been knocked by the inadvertent fitting of a long reach plug.

Good Ascents.

Neville Hall, V. Hawkins, and R. Scott-Walford were the three riders who took part in the event. *The Motor Cycle* representative also drove one of the machines in one of the climbs mentioned, and the manner in which it toyed with the gradient was astounding. Once on the move, top gear was engaged and held on to, until the steepest portion was reached. Then, after travelling for about 150 yards in bottom gear, top gear was again engaged and the little engine easily vanquished what remained of the hill, despite the presence of a strong head wind.



No longer can a rider boast of climbing the formidable Bwlch-y-groes on a 500 c.c. machine, for these two 147 c.c. Excelsiors made several clean ascents.

A Splendid Performance.

To R. Scott-Walford goes the honour of being the first to climb Bwlch-y-Groes on a machine of less than 150 c.c. capacity, and we cannot emphasise too greatly the importance and magnitude of this performance. *The Motor Cycle* has many times voiced its opinion that a great future awaits the ultra-lightweight. This new Excelsior model will do much to popularise this class of machine, and all concerned are to be congratulated on producing a mount of such tiny proportions that is capable of rendering so good an account of itself.

Making light of a famous Welsh test hill. One of three 147 c.c. Excelsiors going well on Bwlch-y-groes which has an average gradient of 1 in 6.

PRE-SHOW ACTIVITY AT BROOKLANDS.

Records by Le Vack, Emerson, Horsman and Longman after a Week of Fog.

THERE should have been a busy week amongst the record-breakers at Brooklands last week. It was, however, a case of man proposing and the weather disposing, for thick fog enveloped the track and compelled inactivity during the first four days of the week.

On Friday morning the thick fog thinned to a haze, and Le Vack brought out his big Zenith-J.A.P. with an eye to the 50 miles, 100 miles, and one hour records in class E. He has equipped his machine with one of the largest—and certainly the best supported—tanks yet seen at the track. It holds five gallons, and is carried on a platform brazed to the undertank tube. Constructed in two separate compartments, the twin tanks are bonded together by metal straps.

The atmosphere was rather damp, and about as bad as it could be from the point of view of carburation, with the result that Le Vack's lap speeds were hardly ever in excess of 90 m.p.h. In consequence, he failed to secure the 50 miles record, but the 100 miles and one hour records fell to him as follows :—

100 MILES.—1h. 6m. 43.4s.
=89.92 m.p.h. (144.68 km.p.h.).
1 HOUR.—89 miles 1,591 yards
=89.90 m.p.h. (144.71 km.p.h.).
PREVIOUS RECORDS.—100 Miles, C. F. Temple (Harley-Davidson), 87.76 m.p.h.; 1 Hour, C. F. Temple (Harley-Davidson), 87.52 m.p.h.

The following day (Saturday) was a day of bad luck, although the weather conditions were slightly more favourable.

A famous speedman at Brooklands. H. Le Vack examining the cylinder of his machine after many gruelling circuits of the track.

J. L. Emerson started the proceedings about 9.30 a.m. by setting out in quest of Class C records up to six hours on his 494 c.c. Douglas. He went well for about an hour and a half, when trouble developed with the valve gear of his back cylinder; he had, however, improved on the existing 100 miles record by 32 secs., his time being :—

100 MILES.—1h. 20m. 14.22s.
=74.77 m.p.h. (120.33 km.p.h.).
PREVIOUS RECORD.—R. N. Judd (490 c.c. Norton), 73.88 m.p.h.

Emerson's ill-luck was shared by others. Le Vack started on his big machine to go for the 50 miles record which he had missed on the previous day, and for many laps he made a really brilliant showing. He led off by a standing start lap at 85.07 m.p.h., and followed it up by averaging 97.25 m.p.h. over the second lap. Then he settled down to a steady lap average of about 95 m.p.h., whilst observations were taken of his course in connection with the controversy recently aired in *The Motor Cycle* regarding the calculation of motor cyclists' speeds on a basis of the 10 foot line. At no point of the course did Le Vack approach within 75 feet of the inner edge of the track.

When only five laps remained to be covered the engine manifested a mysterious "drying up," and Le Vack pulled in to change the plugs. Once again he settled down to 95 m.p.h. laps; but still he could not out-distance bad luck, which overtook him on the 17th lap, when the exhaust valve cap (of aluminium) blew out of the rear cylinder. This caused him to abandon his attempt on the big machine for the day : all he secured for his exhausting effort was the standing ten-mile record, as follows :

STANDING 10 MILES.—6m. 26.90s.
=93.04 m.p.h. (149.74 km.p.h.).
PREVIOUS RECORD.—H. Le Vack (998 c.c. Zenith-Jap), 91.56 m.p.h.

However, Le Vack had his 350 c.c. New Imperial and sidecar ready, and, after a brief rest, he started out to attack the standing ten-mile record in Class B/S. His luck was even worse this time, for he did not complete a single lap. Gear box trouble developed, and, when he reappeared at the timing box, he was being towed.

Next, C. G. Pullin thought he would try *his* luck on a 350 c.c. Douglas outfit, but the fickle goddess likewise refused to smile on him, and he was laid low very soon after the start with frame trouble.

Victor Horsman brought a very imperfect day to a more favourable close by lowering the standing ten-miles record in Class C on his overhead valve 490 c.c. Norton. Making a really excellent start, he covered the standing lap at 81 m.p.h., and put up the following record :—

STANDING 10 MILES.—7m. 5.79s.
=84.55 m.p.h. (136.06 km.p.h.).
PREVIOUS RECORD.—G. Dance (499 c.c. Sunbeam), 82.69 m.p.h.

On Monday last efforts were continued in the same high pitch, and several short-distance records were quickly broken, as under :—

CLASS F (600 C.C. SIDECARS).
V. Horsman (Norton sc.).

	Time. Secs.	Speed. M.p.h.	Km.p.h.
Flying kilometre ...	27.55	81.19	130.67
Mean speed, flying kilometre	27.87	80.24	129.15
Flying mile	44.55	80.81	130.05
Mean speed, flying mile	45.05	79.91	128.60

Horsman also broke the standing start mile record at 63.75 m.p.h.

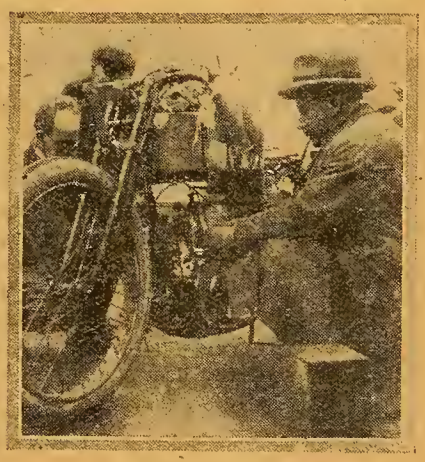
CLASS E (500 C.C. SIDECAR).
V. Horsman (490 Norton).

	Time. Secs.	Speed. M.p.h.	Km.p.h.
Flying kilometre ...	23.75	94.18	151.58
Mean speed, flying kilometre	23.90	93.59	150.62
Flying mile	38.45	93.63	150.62
Mean speed, flying mile	38.82	92.72	149.21

CLASS B (350 C.C. SOLO).
F. A. Longman (349 A.J.S.).

	Time. Secs.	Speed. M.p.h.	Km.p.h.
Standing start, kilometre	36.05	62.06	99.86
Standing start, mean speed, kilometre ...	36.47	61.33	98.68
Standing start, mile ...	53.75	66.97	107.77
Standing start, mean speed, mile ...	54.85	65.63	105.62

Electrical timing was used for all the last-mentioned records.



After every successful record attempt careful measurements are taken of the engine. A. V. Ebblewhite busy examining a record-breaker's mount.

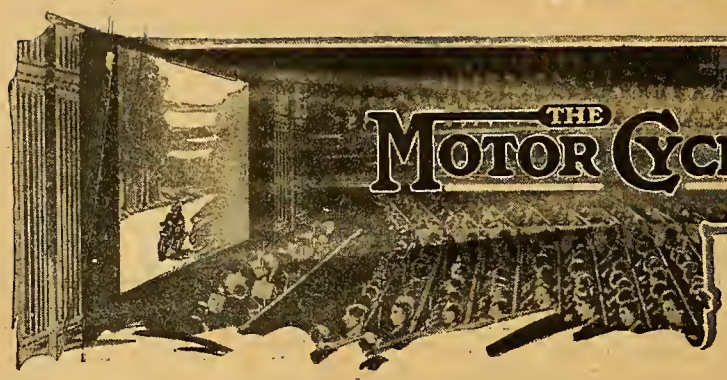
YORKSHIRE CENTRE DINNER.

A GATHERING of 80 members and guests, with a sprinkling of ladies, attended the second annual dinner of the Yorkshire Centre (A.C.U.) on Saturday, the 18th inst. Proceedings were of a friendly and cheerful nature, and the speeches, not without humour, were interspersed with prize-giving and music.

There were present amongst the guests Major Dixon Spain (A.C.U.), Mr. B. Jeffreys (Chairman, Northern Centre), representatives of the daily and technical Press, and many well-known riders.

The Yorkshire centre numbers thirty-two clubs, and is justly proud of its large membership and good trials organisation, which were attributed to the keenness and efficiency of the club officials. Fourteen of the incorporated clubs were represented.

It was pointed out that the nature of the surrounding country facilitated the laying out of thoroughly sporting courses, and members were assured that, in spite of the difficulties of 1922 trials routes, the limits in this direction had not yet been reached, for the officials had in mind new hills, new colonial sections, and new water-splashes.



THE MOTOR CYCLE FILM

Next Week's Release in London. Provincial Clubs Rapidly Booking Dates.

INSTITUTED last year, *The Motor Cycle* film was a huge success. Over one hundred clubs availed themselves of our offer of its loan, and it was thus the means of bringing a pictorial survey of the year's motor cycle activities before that vast body of motor cyclists which is unable to attend the important events which take place in Great Britain, the Isle of Man and France.

Planned with the definite intention of improving upon the previous effort, *The Motor Cycle* film of 1922 events has been made more comprehensive, and its wider range will appeal to all.

After the film has been shown in London (its exhibition at the Broadway Cinema, Hammersmith, terminates on the evening the Show closes) it will start on its journey among the provincial clubs for their Cinema Nights during the winter months. No payment is required from the clubs.

The time occupied to show the film is about forty minutes; it includes incidents in the Senior and Junior Tourist Trophy Races in the Isle of Man, the Motor Cycling Club's Team Trial for *The Motor Cycle* Cup, the M.C.C. London-Land's End Trial (Beggar's Roost), the M.C.C. London-Edinburgh Run ("The Struggle" on Kirkstone Pass), the Motor Cycle and Car Grand Prix Races at Strasbourg, and some amusing examples of American hill-climbing and speed events. The performances of the heavy American twins on a hill so steep that when a rider fails the machine falls over backwards are particularly thrilling.

Actually, two identical films will be in circulation, one touring the southern districts of Great Britain and the other the North of England and Scotland.

Many applications for dates have been received, and it is urgently hoped that when dates are allotted secretaries of clubs will reply by return of post to say if these are convenient. It is most essential that, should a club need the film for more than one night, early application should be made.

A feature of the circulation of the last film was the smoothness of its transfer from one club to another; it was only by strict adherence to time-table and forwarding instructions on the part of all who handled it that its successful tour was assured. Every club secretary concerned earned our admiration on this score.

Already a great many applications have been received, and some thirty-six clubs have been allotted definite dates. The following clubs will be exhibiting the film during the week after the Show :—

(S) Thursday, December 7th. Aberdare and District M.C.C. Maggar's Kosy Kinema, Market Street, Aberdare.
(S) Friday, December 8th. Blaina and District M.C.C. Gaiety, Blaina.
(N) Thursday, December 7th. Widnes M.C. Co-operative Hall, Widnes.
(N) Saturday, December 9th. County High School Old Boy's Club, 16, Market Street, Altrincham.

THE MOTOR CYCLE FILM.

There will only be one appearance o "The Motor Cycle" film in London before it is released to clubs.
For one week, commencing November 27th (Show Week), the film will be shown at

The Broadway Cinema, Hammersmith.
(Five minutes from Olympia).

Prices of Admission: 2s. 4d., 1s., and 8d.
2s. 4d. seats may booked in advance. Tel. No.: Hammersmith 718.

INADEQUATE SCOTTISH ROADS.

THAT there are some 230,000 miles of main and secondary roads in Scotland carrying 4,500,000 passengers and 1,200,000 tons of goods annually—three times the amount borne by the railways—was emphasised by Mr. Thomas Pearson, A.M.I.E.E., in a paper before the Scottish Engineers' Association in Glasgow on November 16th, entitled: "Some Highways and History of Scotland."

The North-Western Highlands of Scotland, it is not always realised, are perhaps the oldest part in the geography of Europe. The curious configuration of the country is due to shrinkage and swelling of the earth's crust, so that a great many parts of what is now the Highlands were once at the bed of the ocean, and *vice versâ*. There is a record of fossil shells having been found on the mountains far away from the sea as long ago as 500 B.C. This does not mean that the ocean level was necessarily higher than it is to-day, but that the hills have been forced up. No doubt the sea levels and depths have gone down. In Scotland the roads are scarce and they follow the great valleys of the country. They have served their day and generation. The advent of heavy modern traffic has changed everything. As the old roads failed when coaches were first put upon them, so are the present roads failing to stand up to modern traffic.—E. M. W.

A SURPRISING PERFORMANCE.

Harper Runabout (269 c.c. Three-wheeler) covers 42½ Miles in the Hour at Brooklands.

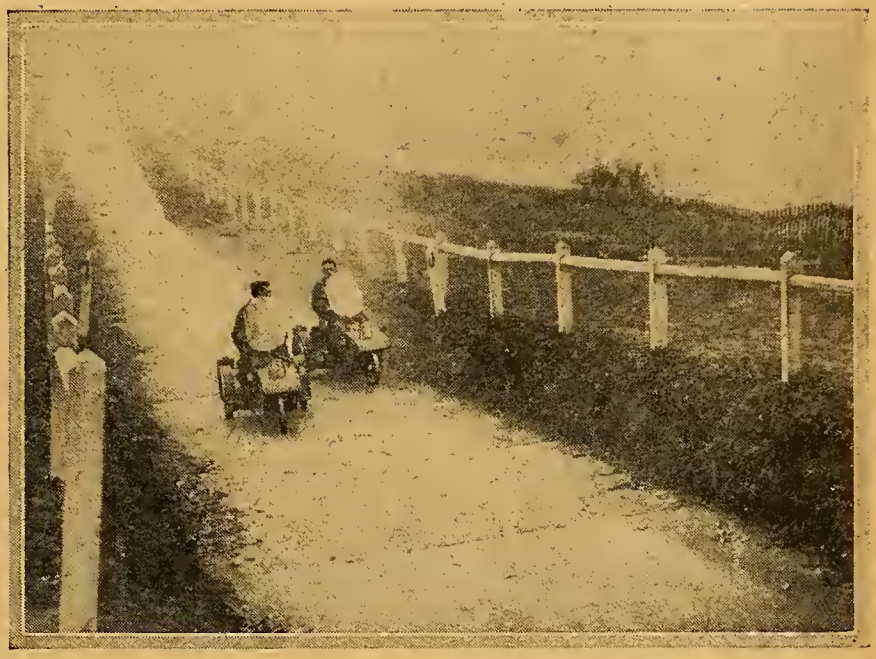
IN this year's Scottish Six Days Trials the remarkable capabilities of the little Harper Runabout were the subject of much comment. But even so, few riders of ordinary motor cycles would have credited its ability to cover over forty miles in one hour on Brooklands track.

Actually, on November 16th, R. O. Harper, on a standard machine in full touring order, equipped with windscreen, electric and acetylene lighting, spare wheel and tyre, tools, and spare tin of oil (total weight, with driver, 534 lb.), covered 42½ miles in the hour, under A.C.U. observation. The fastest lap was run at the rate of 43.16 m.p.h., and the 269 c.c. Villiers engine ran faultlessly throughout, driving the little three-wheeler at a speed not equalled by many touring motor bicycles of similar capacity.

Efficient Transmission.

Much of the success of the Harper Runabout may be ascribed to its excellent springing and the efficiency of the transmission; the former quality in particular being invaluable, as the wheels do not bounce and spin when passing over irregularities in the road or track.

After the one-hour run at speed the machine made two ascents of the test hill from a standing start, the second climb being with an extra adult passenger.



After making nearly sixteen circuits of Brooklands track in one hour (42½ miles), R. O. Harper (269 Harper Runabout) made several clean ascents of the test hill with and without a passenger. Two of the machines ascending the hill in company.

FLOATLESS AUTOMATIC CARBURETTER.

Ingenious Pilot Jet and Choke in Wheeler Design.

FLOATLESS carburetters are by no means common, but, as was mentioned at the time, Engineer-Commander S. G. Wheeler, R.N., who this year won the Arbuthnot Trophy Trial, made use of one.

The carburetter which he employed was the invention of Mr. H. D. Wheeler, 1, Henley Road, Norwich, who is endeavouring to place it on the market.

Variable Streamline Choke Tube.

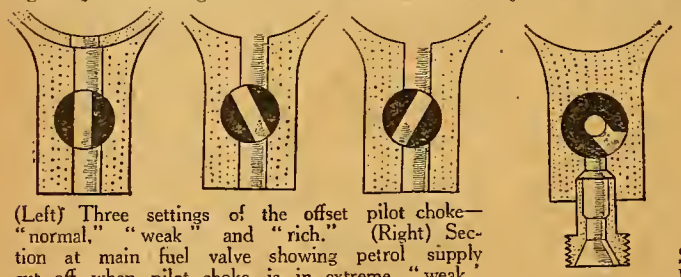
By using a variable streamline choke tube in conjunction with a variable jet controlled by a single main throttle the automatic and correct adjustment of the mixture is obtained at varying throttle openings and varying engine speeds, while a small pilot choke is provided for slow running in neutral. The real choke is formed by a venturi-shaped liner fixed in a straight barrel along which is slid a conical-headed streamline plunger which finds its seating in the venturi liner, and also acts as the throttle. As this plunger is withdrawn from its seating on the liner an annular passage of regularly increasing cross-sectional area is left between the two surfaces. This forms a variable choke, and the effective area at the throat of the venturi tube ranges from nothing when the plunger is in to full bore when it is fully withdrawn. Air is admitted round the base of the plunger through suitable orifices.

Partially vaporised petrol mixed with a small amount of air is supplied through a ring of distributing jets disposed round the throat of the main venturi and forming a diffuser. These jets are fed from the small pilot choke, while the main variable jet leads into the same choke. The jet is regulated by a needle valve carried from a bracket on the plunger or throttle and moving in unison with it, consequently its effective area is varied automatically in proportion to that of the main venturi. The ring of distributing jets or diffusers is placed so that the jets are just not sealed by the plunger when it is home on its seating, thus supplying sufficient mixture for slow running.

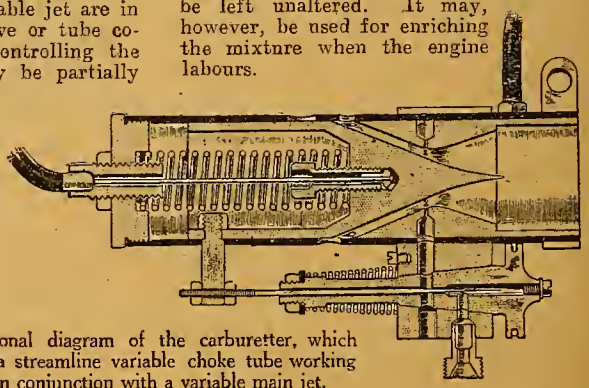
The pilot choke and variable jet are in the nature of a rotary valve or tube coaxial with the needle controlling the main jet. This tube may be partially rotated and is so arranged that when turned in a certain direction the pilot choke is throttled mainly at its outer end, increasing the suction on the jet and enriching the mixture. If the tube is turned in the other direction, the pilot choke is throttled mainly at its inner end, thus decreasing the suction on the jet and weakening the mixture, or if turned still further in this direction, the supply of petrol is cut off. This prevents leakage when the engine is standing and also permits of the opening of the main throttle for supplying air to the engine when coasting downhill.

Automatic Action.

In ordinary use the carburetter is automatic and is worked by the main choke control only. The mixture control lever should be set to "rich" position for starting the machine from cold and brought back to normal or weak when the engine is warmed up, and it can then be left unaltered. It may, however, be used for enriching the mixture when the engine labours.



(Left) Three settings of the offset pilot choke—"normal," "weak" and "rich." (Right) Section at main fuel valve showing petrol supply cut off when pilot choke is in extreme "weak" position.



Sectional diagram of the carburetter, which has a streamline variable choke tube working in conjunction with a variable main jet.

B.M.C.R.C. MEMBERS' DINNER.

FOUNDED thirteen years ago, the British Motor Cycle Racing Club possesses the distinction of being the sole motor cycle club in England the object of which is to develop track racing. It has had a wonderful career, and has done valuable work towards the development of motor cycles. It must not be forgotten that the present classification of motor cycles in competitions is due to its foresight and enterprise.

Last week the club held its annual members' dinner at the Holborn Restaurant, where the chair was occupied by Prof. A. M. Low, D.Sc. There were only three speeches, and as a good entertainment was provided the evening was a bright and merry one, despite the foggy conditions outside, which doubtless interfered with the attendance.

After proposing the toast of "The King," the chairman in a brief but witty speech proposed "The Club," which, he had been told by Mr. Ebblewhite, held 144 out of the total of 149 world's records. (These British successes will probably be reduced in number if the recent Garelli Italian records are passed by the F.I.C.M.)

Response to the toast was made by Mr. D. H. Noble. Later during the evening the principal prizes won during the 1922 season were presented.

It was announced by Mr. T. W. Loughborough. hon. sec., that the 1923 Aggregate Cup would be presented by Mr. Geo. Pettytt. A generous offer was made by Mr. A. Mellano of a 250 guinea cup for a race at Brooklands next year, the conditions to be decided later.

ITALIANS CLAIM WORLD'S RECORD.

CONTINENTAL nations have begun to realise the value of a good track to the motor industry, and it is only since the building of the Italian Motodrome at Monza that serious attempts have been made to lower the English records. This has been done by the Garelli firm, which claims several world's records. The machine used was the same which won the International Grand Prix on the occasion of the opening of the Monza track. The riders were Visioli, who won the 350 c.c. class in the French Grand Prix this year, and Ferragni, who came in second in the 350 c.c. class in the Italian Grand Prix.

Timing was carried out by the official timekeeper of the Italian M.C.C., and the course was measured by the official measurer.

500 Miles at 63 m.p.h.

The following are the results of the attempts :

		Average speed.
100 Km. ...	59m. 17⅘s. ...	62.84 m.p.h.
100 Miles ...	1h. 36m. 10s. ...	62.408 m.p.h
200 Km. ...	1h. 59m. 21s. ...	62.817 m.p.h.
300 Km. ...	2h. 59m. 47.4s. ...	62.112 m.p.h.
200 Miles ...	3h. 12m. 40⅕s. ...	62.232 m.p.h.
400 Km. ...	3h. 0m. 59.45s. ...	62.104 m.p.h.
300 Miles ...	4h. 47m. 37s. ...	62.722 m.p.h.
500 Km. ...	4h. 57m. 24s. ...	62.874 m.p.h.
600 Miles ...	5h. 55m. 15⅗s. ...	63 m.p.h.
400 Miles ...	6h. 19m. 58s. ...	63.18 m.p.h.
700 Km. ...	6h. 51m. 28s. ...	63.4 m.p.h.
800 Km. ...	7h. 50m. 3s. ...	63.4 m.p.h.
500 Miles ...	7h. 52m. 45s. ...	63.4 m.p.h.

If these records are allowed the Garelli will have beaten the 350 c.c. world's records for 300, 400, and 500 miles, and four, five, and six hours, as well as the 400 and 500 miles in the 500 c.c. class.

THREE-SPEED SCOTT AT LAST.

Constant-mesh Gear Box, with Clutch and Kick-starter; Quickly Detachable Rear Wheel; Internal Expanding Brakes.

FOR some time the three-speed Scott has been spoken of, and it has been mentioned in our pages in reports of various north country trials this year.

At last it is to be marketed (£110 solo, £135 with sidecar), and it will be on view at Olympia next week.

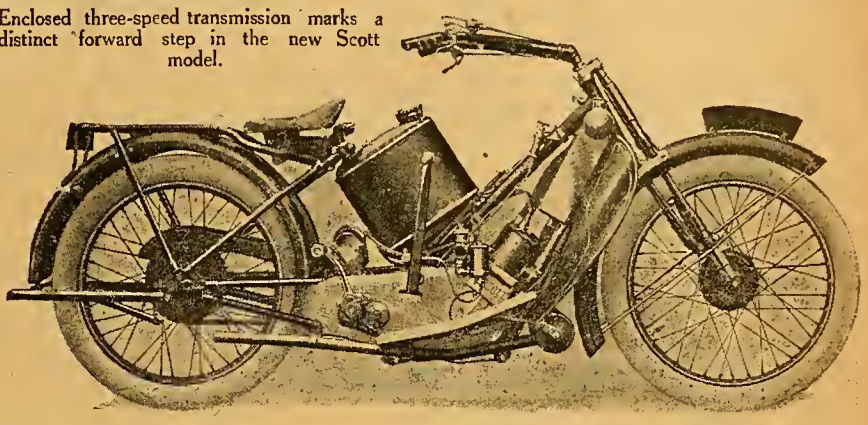
Unaltered in main details, the twin two-stroke (73×63.5 mm.=532 c.c.) engine is bolted rigidly to a well-ribbed aluminium tray, on which is carried the three-speed gear box, clutch, and kick-starter. The box is of the constant mesh gear type having a single moving sleeve and an overhung dog on middle gear. This dog, however, is particularly well supported on a large bronze bush.

Unusual Lay-out.

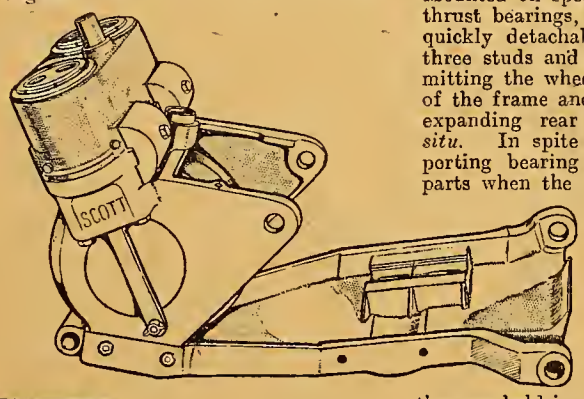
The most unusual feature in the new gear unit is that the driving sprocket for the rear chain—which lies outside the primary chain—is mounted in a large radial ball bearing carried in an aluminium support bolted to the tray and separate from the box. This sprocket is splined to its shaft, and its support must be slacked off when the gear box is moved for the purpose of adjusting the chain. This, however, is a remarkably simple matter, since the nuts are easily accessible.

Working through the layshaft and primary constant mesh wheels, the kick-starter is very light in action, and it is difficult to realise that one is starting a powerful twin engine. On top of the gear box and driven from a sprocket forming part of the clutch housing is the magneto, the chain tension being easily adjustable, while room is left for a Magdyno if required.

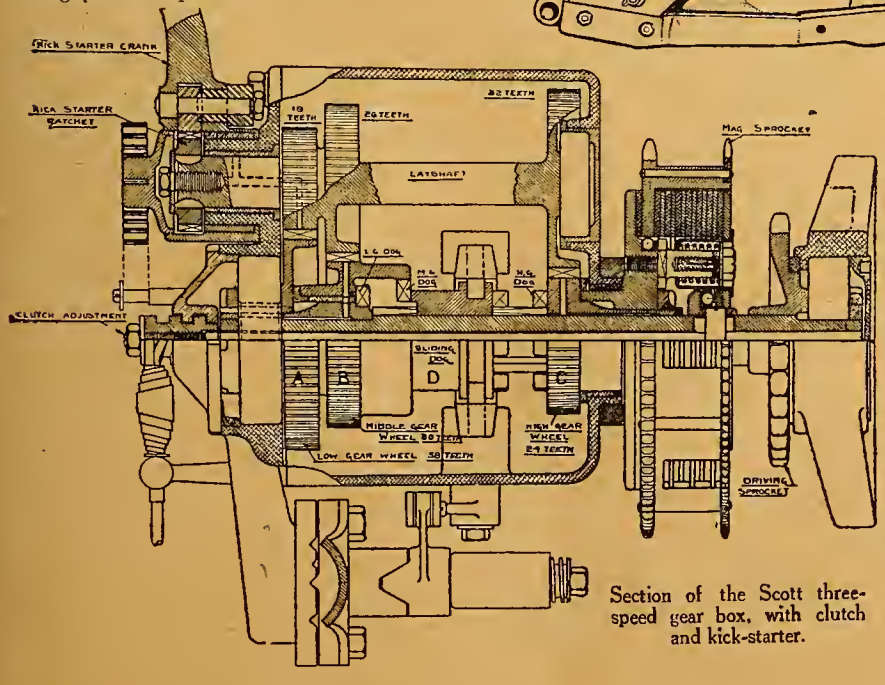
Enclosed three-speed transmission marks a distinct forward step in the new Scott model.



Slight modifications to the frame have been necessitated by the new gear box, but though it is wider behind the engine it retains the characteristic Scott lines. It is still constructed of straight tubes throughout.



Base plate mounting for the gear-box and engine on the three-speed Scott. The new transmission has not necessitated engine modifications.



Section of the Scott three-speed gear box, with clutch and kick-starter.

Both hubs are entirely new, and an extra large Webb expanding brake is included in the front wheel, the anchor plate being arranged to slide off its stop when the front wheel is withdrawn. Mounted on special Hoffmann radial and thrust bearings, the rear wheel is of the quickly detachable type, the removal of three studs and a knock-out spindle permitting the wheel to fall away well clear of the frame and mudguards, leaving the expanding rear brake and sprocket *in situ*. In spite of this there is no supporting bearing for the last mentioned parts when the wheel is withdrawn, and they are held in place chiefly by the brake anchorage. Re-erection of the wheel is simple, an arrangement of tapers making the spindle self-centring. The ball bearings are packed with grease, and a special method of refilling is provided, though this should not be required for five or six thousand miles, since the hubs are very well protected by felt washers.

Considerable improvements have been made in the mudguarding, though the previous Scott models have lacked little in this respect.

In addition to the seven-inch flat guards with gutters on either side, the legshields have been carried further up and reach to the very top of the radiator tank. The footboards also are neater and are carried on a new type of spring which is claimed to be unbreakable. A new oil filler has been introduced extending forward to a more convenient position, and allowing oil to be poured in at a reasonable rate, and the petrol capacity has been increased to three gallons.

On the road the new three-speed Scott with three-inch tyres is the very height of luxury; it is smooth to a quite extra

Three-speed Scott at Last.—ordinary extent, the new gear appearing to dissipate the slight snatch which is sometimes apparent in the two-speed model when running slowly "on top." Steering is as near perfection as can be desired; the gear change is convenient, and the clutch is sweet in action, though in the case of the machine we tried it was inclined to drag to a slight extent. On middle gear of approximately 6 to 1 we easily surmounted a hill of 1 in 6 with no preliminary rush, and the 12 to 1 low gear gives one a feeling of confidence on the freakiest of freak hills. For solo use a top of 4.1 to 1 is fitted, but slightly lower ratios are fitted for sidecar work. Both front and rear brakes are smooth and powerful enough for a passenger outfit or any gradient.

The Scott Squirrel, except for a slight inclination of the sparking plugs to allow clearance for the radiator, remains unchanged. The price is now £89.

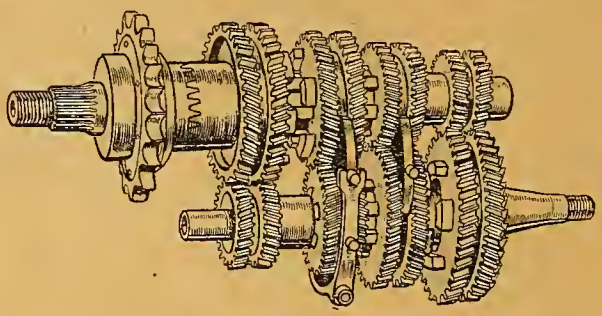
RUDGE FOUR-SPEED GEAR.

New Box Available on 499 c.c. and 998 c.c. Chain-driven Models.

IN the future both the twin and single-cylinder Rudge machines will be available fitted with a four-speed gear box. Neatness and compactness of design characterise the new box.

Double helical teeth are employed, all gears being constantly in mesh, and ball and roller bearings are fitted to all parts, with the exception of one end of the kick-starter shaft, which runs in a plain steel bush.

Eight pinions are used in the box. One is fixed on the driving sprocket sleeve, and it meshes with one fixed on the layshaft. On the other side of the main shaft is fixed a small pinion meshing with another running freely on the layshaft. Between these two pairs of wheels are two other pairs of pinions sliding on splines which are suitably removed from those parts of the shafts on which the wheels must run free in certain gear positions. Both sets of wheels slide in pairs.



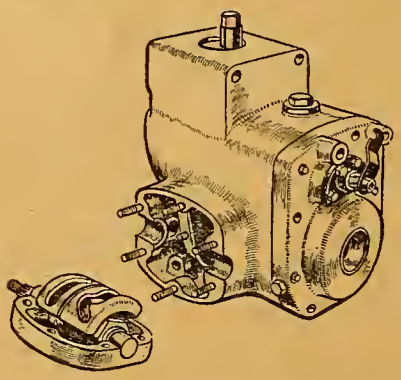
Main and layshafts of the Rudge four-speed gear; the kick-starter mechanism and clutch are not shown. The use of double helical pinions is unusual in motor cycle practice; it should be conducive to extremely silent running.

Selective Action.

Top gear is obtained by bringing the left pair to the extreme left, and the main shaft wheel engages the dogs of the sprocket sleeve pinion, giving a solid drive. By sliding the pinions to the right the layshaft wheel engages splines on the layshaft, and the fixed wheel thereon drives the sprocket sleeve pinion through its fixed wheel; this is the third speed.

When second speed is needed, the left pair of pinions return to their midway neutral position, and the second pair is brought to the extreme left, both pinions being on splines. Moved half-way to the right, the main shaft pinion comes on to a free portion of the spindle, and a pinion dogs engage those on the layshaft free pinion and the low gear drive is obtained from the main shaft fixed wheel to the layshaft fixed wheel and the sprocket sleeve.

The selectors are two segments in which are cut cam slots so arranged that one is in neutral while the other moves the gears, and *vice versa*. Each cam slot engages a pin and roller on the forks which move the striking plates inserted in the grooves between the teeth of the sliding pinions. By removing a cover plate the selector mechanism is readily accessible.



On the Rudge four-speed gear box the selector mechanism may be removed with the inspection cover while the box is in position on the frame.

Carried in the hollow layshaft is the kick-starter shaft, which is well supported by roller bearings at one end and a plain steel bush at the other. All the kick-starter mechanism is enclosed.

Control Mechanism.

Mounted on a bracket brazed to the front down tube of the frame is a gate change and lever, which is adjustable for position. Running from this bracket is a long connecting rod which operates a bell crank on a bracket mounted on the seat tube. This bell crank in turn actuates a link connected to a lever on the selector shaft.

Standard gear ratios employed on the single-cylinder machine are: 16.3 to 1, 11 to 1, 7.15 to 1, and 5 to 1. On the 998 c.c. twin the gear ratios are: 13 to 1, 8.8 to 1, 5.7 to 1, and 4 to 1.

A LIGHTWEIGHT CARRIER TRICYCLE.

Melen Tradesman's Delivery Outfit with 297 c.c. two-stroke Engine.

THOSE tradesmen, who desire a vehicle that is capable of handling light goods at a minimum cost, will be attracted by the three-wheeler produced by F. and H. Melen, Ltd., Sherlock Street, Birmingham.

Two sections of angle steel, bridged at intervals by cross members, form the frame. The side members are splayed outwards at the front to accommodate the box carrier. The saddle is mounted on an upright structure at the rear, a similar structure carrying the handle-bar.

The steering pillar extends downwards below the frame where it is linked to two arms which are attached at their forward extremities to the tie rod, the latter being carried on the steering arms on the swivel joints at each end of the front axle. This axle is suspended from the frame by four coil springs which insulate the carrier box from road shocks.

The wheels have 24in. × 2½in. tyres, and the mudguards are of wide section.

Two brakes are fitted both operating on the rear driving wheel. The foot brake is an external contracting band, while the hand brake consists of a pad operating on the inside of the drum. The power unit is a union two-stroke of 297 c.c. equipped with an Amac carburetter and a C.A.V. magneto. The primary drive is by chain to a three-speed Burman gear box with clutch and kick-starter. The final drive is also by chain. A point of interest is that the engine and gear box may be removed from the frame by merely removing four bolts.

A large capacity box is mounted forward of the handlebar, its carrying capacity being in the neighbourhood of 1½ cwt. An illustration appears on p. 758.

CLUB NEWS

Dewsbury and District M.C.C.

In future the above club will be known as "The Yorkshire Heavy Woollen District M.C.C." Mr. F. Bray, 64, Warren Street, Savile Town, Dewsbury, still remains hon. secretary.

Bristol M.C.C.

Results of the motor cycle classes of the handicap hill-climb, held recently (the subject of a recent article), are as follows:—

SECTION I., TIME.

CLASS 1.—1, K. J. Woods (348 Wilkin).

CLASS 2.—1, J. James (249 J.A.P.); 2, F. Chapman (211 Royal Enfield). 3, H. Alford (211 New Hudson).

CLASS 3.—1, G. Tucker (349 Cotton); 2, A. Tutton (349 Massey-Arran) tied with R. Lawson (348 Douglas); 3, A. R. Passey (348 Douglas).

CLASS 4.—1, A. Tuttnn (349 Massey-Arran); 2, R. Lawson (348 Douglas); 3, B. New (348 Monopole).

CLASS 5.—1, C. Sgonina (499 Sgonina Special); 2, E. W. Spencer (494 Douglas); 3, R. Houghton (492 Sunbeam).

CLASS 6.—1, R. Houghton (492 Sunbeam); 2, E. C. Collins (490 Norton); 3, R. A. Rioch (492 Sunbeam).

CLASS 7.—1, C. Sgonina (499 Sgonina Special); 2, V. Anstice (494 Douglas); 3, E. W. Spencer (494 Douglas).

CLASS 8.—1, R. Honghton (492 Sunbeam); 2, E. C. Collins (490 Norton); 3, R. A. Rioch (492 Sunbeam).

CLASS 9.—1, V. Anstice (494 Douglas); 2, E. W. Spencer (494 Douglas); 3, C. Sgonina (499 Sgonina Special).

CLASS 10.—1, R. Houghton (492 Sunbeam); 2, E. C. Collins (490 Norton); 3, R. A. Rioch (492 Sunbeam).

CLASS 17 (*Sidecars*).—1, V. Anstice (494 Douglas sc.); 2, G. Tucker (490 Norton sc.).

CLASS 18 (*Sidecars*).—1, S. Hodges (398 A.B.C. sc.); 2, F. Cooke (499 Sunbeam sc.); 3, R. Fowcraker (492 Sunbeam sc.).

CLASS 19 (*Sidecars*).—1, V. Anstice (494 Douglas sc.); 2, G. Tucker (490 Norton sc.); 3, Gerrish (976 Brough-Superior sc.).

CLASS 20 (*Sidecars*).—1, Gerrish (976 Brough-Superior sc.); 2, H. N. Walker (490 Norton sc.); 3, H. Jacobs (976 Zenith sc.).

SECTION II., HANDICAP.

1, F Calleja (349 Excelsior-Blackburne), time improved by 2⅕s. Committee Challenge Cup and gold medal; 2, H. Alford (211 New Hudson) tied with Gerrish (976 Brough-Superior sc.), time improved by 1⅗s., silver medals; 3, R. Lawson (348 Douglas), time improved 1s.

A gold medal for fastest time of the day was awarded to C. Sgonina in Class 7, Section I.

The club's 6-hour trial for the Hutchinson and Ferrson Cups which, after two postponements, was to have been held on October 21st, has been put off indefiuitely, as it was found impracticable to tackle two very bad hills after dark; it has been suggested that the event be held on Boxing Day.

South-West London M.C.C.

The annual dinner will be held at Anderton's Hotel, Fleet Street, on the 14th prox., at 7.30 p.m. Morning dress will be worn. Tickets are obtainable from the hon. social secretary, Mr. C. F. Morgan, 3, Stockwell Avenue, S.W.9.

North Derbyshire M.C.C.

The sixth annual dinner and prize distribution of the above club will take place to-night (Thursday) at 7 p.m., in the Hotel Portland, Chesterfield. Tickets may be obtained from Messrs. J. W. Damms, R. B. Green, A. Adams, A. W. Webb, or from the hon. sec., Chas. Ullyatt, 75, Hunloke Avenue, Boythorpe, Chesterfield.

Bedford and District M.C.

A successful paper chase, combining a distance-judging and observation test, was held on 5th inst. over a course of 47 miles. Fifteen objects of a humorous nature were distributed on the course, and of these the winners observed eleven. The run was followed by a tea at club headquarters. Provisional results:—Solo, A. Swift (Zenith). Sidecar, R. B. Bates (976 Royal Enfield sc.).

The championship trial was held over a sporting course in the Chilterns on 15th inst., and included stooping and restarting test on Whipsnade Hill. The distance for the final part of the trial had to be estimated by competitors. Provisional results:—Club Championship, Mayor's Cup and gold medal, N. M. Bligh (749 A.J.S.); runner-up, T. French (Sunbeam sc.). Allen Cup and silver medal.

Burton M.C. and L.C.C.

The Burton, Tamworth, and Lichfield clubs held very successful speed trials recently. Times over the half-mile course were made as follows:

CLASS 1 (TIME).

650 c.c. SIDECARS.—1, P. B. Chesterton (490 Norton sc.), 34s.; 2, B. Rushton (633 Norton sc.), 38⅖s.

CLASS 2 (TIME).

300 c.c. SOLO.—1, C. Jones (249 Diamond), 35²⁄₅s.; 2, S. T. Ridgway (249 Diamond), 35⅘s.

CLASS 3 (TIME).

350 c.c. SOLO.—1, A. L. Baldock (350 Beardmore-Precision), 33s.; 2, V. F. Trevor (349 A.J.S.), 33⅕s.

CLASS 4 (TIME).

650 c.c. SOLO.—1, B. Fidgeon (490 Norton), 28³⁄₅s.; 2, B. Rushton (633 Norton), 30⅕s.

CLASS 5 (TIME).

UNLIMITED SOLO.—1, B. Fidgeon (490 Norton), 27⅕s.; 2, V. Poynton (998 Indian), 28s.

CLASS 6 (FORMULA).

UNLIMITED SOLO.—1, S. T. Ridgway (249 Diamond); 2, W. Aston (249 Diamond).

CLASS 7 (TIME).

1916 OR EARLIER MACHINES, UNLIMITED.—1, S. Barrett (348 Douglas), 38⅕s.

Silver medals were awarded for 1st and 2nd place in each class.

SILVER CUP FOR FASTEST TIME OF DAY.—B. Fidgeon (490 Norton), 27⅕s.

Luton and South Beds A.C.

It was decided, owing to the much regretted decease of the club's President, Lord Ludlow, that the annual dinner arranged for the 18th inst. should be postponed. A revised date will be announced later.

Gainsborough M.C. and L.C.C.

A gold and two silver medals were competed for in a reliability trial held on the 4th inst. in and around Gainsborough. The gold medal was won by F. Pullan (499 Triumph), who gained 85 per cent. of the total marks. L. Dady and C. F. Batt were second and third respectively. The next trial will be held on the 2nd prox., and will be an open event; particulars may be obtained from Mr. W. R. Adair, 2, Allred Street, Gainsborough.

Croydon and District M.C.C.

Excepting only the team prizes, no awards were gained in a 100-mile trial held on the 5th inst. This was partly accounted for by the inclusion of "Old Chalkey" in the route. Mr. Hagen's prize was taken by the Wallington Club's solo team, consisting of Reg. Green (490 Norton), E. C. Gordon (499 Triumph), and S. Lavy (492 Sunbeam). Owing to the arduous nature of the route special bronze medals are to be awarded to the eleven finishers.

North-West London M.C.

About forty members spent a very pleasant and informal evening on the 4th inst. After a supper party at Golders Green a visit was paid to the local hippodrome, where a revue was much appreciated. It is hoped to arrange a similar function soon after Christmas. Members are reminded of the Sunday afternoon run to the White Horse, Shenley, on the 26th inst.

Fixtures for the coming winter season have been made as follows:

November 26th.—Run to the "White Horse," Shenley. Members should meet for tea at 4 p.m., wet or fine.

January 9th.—Annual dinner at Holborn Restaurant.

January 25th.—Annual general meeting.

Dates for *The Motor Cycle* film and a whist drive will be fixed later.

Taunton and District M.C.

Thirty competitors entered for the Taunton Autumn Trial, which was run over a circular course of 120 miles, including Stout Hill, near Taunton. The Bath competitors declared this hill to be unclimbable, but W. G. Churchill accomplished the ascent on a 350 c.c. Beardmore B. and S. Results: Autumn Challenge Bowl, W. G. Churchill (350 Beardmore B. and S.); Taunton Traders' Bowl, T. W. Drayton (Salmson car); Team Challenge Cup, Taunton and District M.C. and L.C.C. team, P. V. Hare (494 Douglas), I. F. Anderson (293 Connaught), and L. Pearce (595 Douglas); 350 c.c., 1, I. F. Anderson (293 Connaught) and C. Fletcher (Hewin Experimental); Unlimited, 1, L. G. Morrish (492 Sunbeam) and P. V. Hare (494 Douglas).

The Editor does not hold himself responsible for the opinions of his correspondents.

Correspondence should be addressed to the Editor, "The Motor Cycle," Dorset House, Tudor Street, E.C.4, and must be accompanied by the writer's name and address.

ALT-Y-BADY.

Sir,—No doubt "J.W.B." is not aware that I earn my living by competition riding, which must be my excuse for taking any notice of his inference that my proposed second-gear climb of Alt-y-Bady, in last year's Reliance Cup Trial, was throwing away all chances of a clean climb.

I should like to make it quite clear that my original letter was written with the full consent and knowledge of the firm concerned, Messrs. Powell Bros.

"J.W.B." states that he cannot see why any man should fail to make 99 clean ascents out of a 100; will he meet me at Alt-y-Bady at any time most convenient to himself, and demonstrate the truth of this? If so, I will have great pleasure in taking either a standard Powell or the sports Powell up in second for his benefit—if I can!

Finally, I consider no ascent of Alt-y-Bady clean if the feet are moved from the rests (or footboards).

J. WESTWOOD WILLS.

CASTOR OIL IN ENGINE LUBRICATION.

Sir,—I have read with no little astonishment Mr. Evans' reply to "Kemist's" letter in your issue of November 9th. Would Mr. Evans kindly explain just what he means by saying that the application of the term paraffin to mineral oils alone is "incompatible with scientific practice"? This I can tell him—its application to oils other than mineral is incompatible with a knowledge of chemistry! Is he aware that it would be essentially unscientific to apply the term paraffin (*i.e.*, inactive) to vegetable and animal oils, as these compounds are exceedingly active, entering readily into combination with a variety of substances and being easily decomposed daily in soap works by the simple process of boiling with alkalis!

To apply the term "unfortunate" to "Kemist's" statement that mineral oils cannot give rise to fatty acids is both meaningless and absurd. What Mr. Evans means by "the chemistry of lubrication" I know not, but if he is acquainted with a process by which he can produce the fatty acids from the saturated hydrocarbons he has, indeed, made a discovery in the science of chemistry, and I, for one, should like to see a chemical explanation of the reactions involved.

Of course, I am well aware that, say, methane can be converted into acetic acid by a series of involved reactions, but that is a different proposition from the conversion of a mixture of the higher hydrocarbons to fatty acids by combustion in an engine cylinder. "CATALYST."

Edinburgh.

SECRETS OF TUNE.

Sir,—Mr. R. Landon finds it difficult to give credence to my remarks in regard to increasing the speed of standard Rudge machines. I do not doubt him for one moment.

In view of no little experience of tuning a considerable number of this make of machine, I find it difficult to give credence to some of his remarks, particularly when I note the peculiar method of argument of which he makes use.

The maximum of the *average* Rudge-Multi (against the stop watch) in good standard tune is certainly not over 55 m.p.h. in still air and normal level road, *not* 58 *m.p.h.*, as Mr. Landon would have it. We are referring to average machines, not particular ones. A range of 52 to 55 m.p.h. would cover most of the Rudge-Multis on the road. Now, adding to these the range of increase which I mentioned previously (11 to 14 m.p.h.), we find by the alterations which I have in mind, that the new maximum range is 63 to 69 m.p.h., which statement of affairs is as I have found it.

It is Mr. Landon's assumption that the alterations are "simple." I made no comment on them!

The I.O.M. Rudge-Multi is no heavier than many 500 c.c. machines; it weighs 233 lbs. Moreover, weight makes very little difference to speed where a case of maximum is under consideration; it certainly affects the distance taken to attain the maximum, and also the average, but not the figure under review to any considerable extent.

In regard to the question of scored cylinders in effect upon speed, I had a Rudge in 1920, which with one alteration and a badly scored cylinder (due to a gudgeon getting adrift) earned a certificate for 65.4 m.p.h. on the level road; I must admit though, that the pulling was somewhat affected, which is as might be expected. "BEMSIST."

Bexley Heath.

HEAVY ENTRY FEES IN CENTRE TRIALS.

Sir,—I have noticed that the A.C.U. Yorkshire Centre competitions, especially the last two events, have not had the support which they should have had.

The reason, in my opinion, is not far to seek, as I have had it pointed out to me by several riders that the entrance fees charged are prohibitive, and I find that these competitions appeal to many who honestly cannot afford to enter them and their own club events as well. The expense does not end with the entrance fee. I think a smaller fee would attract a larger entry, make the competition keener, and at the same time make very little difference on the financial side. WM. E. ASQUITH,

Hon. Secretary, Leeds and District M.C.

CELLULOID EYE SCREENS AT NIGHT.

Sir,—May I take the liberty of writing you in reference to "Awahawakawoo's" letter, since it has again raised a question of general interest to motorists?

He has purchased a celluloid *windshield*, for which purpose it is admirably suited, and although "Ixion's" comment is true generally, your correspondent has fortunately secured a specimen having very little selective absorption.

Now celluloid is incapable of transmitting light without destroying the clearness of any object seen through it. This defect can, and will, only be intensified with wear, and its continual use can only be detrimental to one's eyes.

Your correspondent also wishes to know why he cannot recommend the article for night riding. When riding at night, the eyes are straining to utilise every fraction of available candle-power. Now celluloid about 0.02in. thick of good quality absorbs 11.5 per cent. of the total light falling upon it. This reduction is a very serious matter indeed, and secondly, the bad defining power as mentioned above will be more apparent at the low intensity.

One must remember that with glass goggles absorbing only 3 per cent. very few riders care to wear them for night riding. Celluloid is at the very best about four times as bad as glass! "ROVER."

London, N.19.

PILLION RIDING IN SAFETY.

Sir,—In Holland pillion riding is the rule rather than the exception, and one seldom sees a rider without a passenger "up" behind him. Yet there is no outcry against its dangers here. We think this is due to the fact that all pillion passengers, without exception, both male and female, sit astride the pillion seat. It will be found, we imagine, that the custom of sitting sideways is the dangerous factor in pillion riding. It merely requires a press campaign in favour of the more sensible, if less graceful, position to get rid of the menace of popular alarm and panic legislation. P. G. WILSON

Amsterdam. (B.C.A., LTD.).

Sir,—Although your contributor expresses what I believe to be the opinion of the majority of motor cyclists on pillion riding, I beg to differ.

In the course of about 15,000 miles' riding with pillion passenger, I have come to the conclusion that in emergencies the passenger can always alight more easily when seated side-saddle, and thus only the rider may come to grief.

I have touched 58 m.p.h. with passenger side-saddle, without any lack of control.

Your readers' views would be interesting. A. B. C.

Bristol.

Sir,—I feel bound to agree with you that more security is felt by the driver with his pillion passenger seated astride.

This has led me to assume that if a saddle with its special shape has been designed for the motor cyclist as the proper thing, it ought to follow, as day follows night, that a similar fitting is the proper thing for the pillion rider. H. KILLINGBECK.

HUMIDITY AND POWER OUTPUT.

Sir,—May I suggest that "J.H.H." cannot conveniently bring the barometer into the discussion, for the changes of this instrument depend, primarily, according to modern notions, on variations of pressure in the atmosphere, and the resulting rain (or drought) follows as a result, and is not itself the cause of the pressure variations. Has "J.H.H." ever heard of a marked difference between the barometer readings taken (1) close to the grass during dew-fall, and (2) higher in the air, during the same evening?

"M.B.B.H.'s" explanation seems to be backed up by the statement that one or more persons have introduced the steam from their radiators (on cars) to the engine, *viâ* the carburetter, and have found an increase of power; also by the fact that many an engine (I believe?) shows far more liveliness during the first few miles than later, when the petrol is warmed up and therefore less dense.

This being so, would not an ether mixture be advantageous? Ether is very heavy.

With regard to the adequate mixing of the vapour and air, has anyone tried fixing: (1) a fine gauze; (2) a light, tiny fan, in the induction pipe? I think "M.B.B.H." has sounded a very important note.

Belfast. RESEARCH THE CARBURETTER.

Sir,—I would like to state that even the humble push cycle runs better at night, while the difference between a man walking with and without a little internal humidity is truly remarkable. Witness the numerous "filling stations" on the average road. MAEBNUS.

Oxford.

Sir,—I quite agree with Mr. P. F. Jarrold's first remarks, but am not by any means convinced by his explanation.

On an average, humidity is at its highest around sunrise, and at this time temperature is at its minimum. I have been "privileged" to do much riding at dawn, and cannot claim that my big single has tended to "super-Rudge."

In my opinion much of the extra power is imagined, as one thinks that the 'bus is travelling much faster at night when the only objects seen are those within the very limited range of the lamp. 49867.

Ashford.

Sir,—Your correspondent, Mr. P. F. Jarrold, is young, and, although wisdom does occasionally emanate from the mouths of babes and sucklings, he has yet a little more meteorology to learn.

He is, of course, quite correct in stating that relative humidity has little effect on barometric readings, but he seems to concur with "M.B.B.H." in assuming that water vapour increases the density of the air. The fact is that, other things being equal, an increase in moisture content would cause a decrease in the atmospheric density.

Moreover, Mr. Jarrold appears to think that the density of the atmosphere varies only as the pressure, hence his apparently overwhelming argument that in an "anticyclone" a baby two-stroke should have the kick of a Brough Superior. He is wrong; atmospheric density is not only dependent on pressure, but also on temperature, and it is a recognised fact that the average density of the air in a "depression" is very little different from that in an "anticyclone." Mr. Jarrold can substantiate this statement for himself from standard meteorological publications.

With regard to the superior running of a machine at night, I myself have experienced the feeling that my engine has more than its normal supply of "pep," but I am almost convinced that it is a delusion consequent on the extra caution of the rider, rendered imperative by the impaired visibility. W. ANDREWS.

H.P. OR FUEL TAX?

Sir,—As Mr. Collyer doubtless knows, the motor tax was introduced to pay for the upkeep of the roads, and it therefore seems only fair that the amount of tax paid by a vehicle should be in strict proportion to the damage done to the roads by that vehicle. The present system does not provide for this, as Smith, who only runs a sidecar outfit on Saturday afternoons and has a total mileage of, say, 3,000, pays the same tax as Jones, who runs an outfit every day and has a total mileage of 20,000.

If the petrol tax was re-introduced the heavy lorry or car with a high petrol consumption would pay more than the lighter motor cycle. Also the total amount payable would vary directly with the mileage. L. HOLMES.

Sir,—Evidently Mr. R. Collyer has not studied the matter of fuel tax.

For the sake of explanation let us suppose "A" rides 300 miles per week for a year, making a total of 15,600 miles. If 80 m.p.g. is taken as an average, he uses 195 gallons of petrol. If there is a tax of 2d. per gallon the rider pays £1 12s. 6d., against £1 10s. (or £3 as the case may be). which is not a great fortune.

Further, not *so* many riders average 300 per week, so the new tax tends to come in cheaper. M.S.M. 233.

Sir,—I cordially agree with your correspondent, Mr. R. Collyer, and, while he remarks that the h.p. tax is too heavy, I do not think many would complain if only the income derived from it was used for road improvements as intended, but I am afraid it mostly goes to provide a horde of officials with fat salaries.

I maintain that any man or woman who can afford to pay £50 for a solo, or £150 for a sidecar outfit, which is used *solely for pleasure*, can afford an additional 30s. or £4 per year.

Take my own case, and there are thousands like me. I average 300 miles every week of the year. I ride through rain, hail, and snow, over main roads, secondary roads, and cart tracks, and very often at the end of the week I find that my earnings have just about covered my expenses.

It stands to reason that any man who does 15,000 miles per annum must have heavy tyre bills, to say nothing of other replacements such as chains, belts, etc., while the pleasure rider can probably go a whole year without a single replacement.

It is said that we commercial motor cyclists use the road more than the pleasure riders. We do. 'Tis true, and pity 'tis, 'tis true. A good many of us wish we didn't. But motor cycles and sidecars cannot damage roads.

Bury St. Edmunds. XR 3296.

FEW SIDECAR SUBSTITUTES.

Sir,—Very few indeed of the cars shown at the Paris Salon, Olympia, or the White City, have conformed to the definition of a cycle car, "engine under 1,100 c.c., and weight under 7 cwt." At Olympia and the White City the vogue of the light four-cylinder car, which cannot possibly be classed as a cycle car, was apparent. At the Salon the twin cylinder was hardly in evidence. A French paper complained that "the quest of the very cheap machine has not fulfilled the hopes of its numerous *clientèle*," and that "the so-called cycle car of to-day is simply a car which pays 100 fr. tax"—happy car!

The apostasy, as you call it, of the G.N. is a heavy blow to the popularity of the simple four-wheeler in England. I note in a contemporary a list of 33 cars costing £200 and under, but of these only 12 have been, or will be, shown this year, and of the dozen, five are three-wheelers. The Tamplin is, I believe, the only four-wheeler shown which is priced as low as £150; the Morgan three-wheeler will be sold at £128.

A good deal has been written lately on the question "Will the three-wheeler survive?" If it does not (a very unlikely contingency) the true cycle car, the rival of the heavy sidecar, is indeed "moribund"; but, even so, I should be inclined to write as its epitaph, "Resurgam," not "Requiescat in pace." H. GEORGE MORGAN.

HARDIER NORTHERNERS?

Sir,—May I, as a Londoner who is proud of it, be allowed to say a few words to "Ixion"?

To begin with, I am afraid that "Ixion," in spite of his undoubted experience, must go about with his eyes shut, or he could not possibly make such an absurd statement as ". . . . most Southern motor cyclists take jolly good care to return home before dark." Anyone who has ever ridden on the Bath Road, the Great North Road, or any of our great highways after dark can hardly have failed to note the constant stream of motor cyclists proceeding Londonwards. Possibly, however, "Ixion" takes jolly good care himself to be home before dark?

He practically admits that Northerners are mostly splendid imitations of particularly surly hogs. It is also unnecessary for him to state that he is a "Lancashire lad," for no Southerner would take the trouble to insult gratuitously thousands of motor cyclists simply because they have the good fortune to be born in a part of the country where people are actually civil to one another!

Of course, one realises that those less fortunately situated than the Londoner may be inclined to be envious, but "Ixion" should not give way to it.

So the Southerner would not ride at all if he lived in the North!

I ride a single-geared two-stroke, winter and summer alike (*and* after dark!), which in my opinion takes more doing than humming along on a 500 c.c. 'bus with three-speed, clutch, chain drive, and every other refinement, as belt-slip is certain on a really wet day. And that I am no exception to the majority is proved by the hundreds of motor cyclists to be found on southern roads winter and summer alike. A SOUTHERNER.

London, N.W.6.

Sir,—"Ixion" recently championed the cause of Northern riders; who are blessed (it is alleged) with entrails of a far longer and tougher nature than we "Southerns."

It is to be regretted that such an old friend should excommunicate himself from us by a few indiscreet and positively untruthful sentences, and no doubt this reply will only be a tiny portion of the colossal howl of protest and execration which will rise from ten thousand exhausts, and converge on London as a real "pea-souper."

I do not know if superfluous election passions, or an unfavourable circulation record are to blame for this outbreak; whatever the reason, such an indictment cannot pass unchallenged. In the first case the apparent superiority of the North is only obtained by the nature of the reports published, and being the centre of the industry (for economic reasons only) it is only to be expected that, to many, motor cycling is a stern reality of existence, and not the pastime we are pleased to consider it; as a direct result, trade questions, I fear, crop up even in the den of venerable "Ixion," who openly confesses to his Lancastrian origin.

Again the geographical position favours the North, as slag heaps are not tacked on to our back doors like mudscrapers, and taken as medicine which we pretend we like, as they cannot be dodged—we are unable to dodge anything more formidable than super-tuned policemen, who migrate here in vast numbers, and find it so bracing—and profitable.

No, "Ixion"! whilst taking off our hats to certain of the northern stalwarts, as typified by George Dance, we certainly have no intention of laying down and being run over by them, and until more forceful arguments are brought up in proof I for one will not forsake our country for coal-mines, or macadam for the mud-holes which you seem to regard as something of an acquisition.

A. E. JESSOP,
Hon. Trials Sec., West Kent M.C.

NONE TOO EASY PAYMENTS.

Sir,—The following are the easy payment terms for a certain lightweight: Price of motor cycle, £24 3s.; terms, £5 down and 12 monthly payments of £1 17s. 6d. = £27 10s. This works out at 17½% interest by the most favourable calculations, but taking into consideration that 37s. 6d. is being paid monthly, I should think it is actually nearer 30%, if not more. Why should those who have little be charged this exorbitant sum? NOT LIKELY.

West Hartlepool.

Sir,—The question of "easy payments" raised by Lt.-Col. Le Mesurier seems of sufficient importance to merit further attention, as your subsequent correspondents do not appear to have grasped the real point of his letter, viz., the effect of payment by monthly instalments on the rate of interest.

In your issue of 2nd November, "Zenith" draws attention to an instance which shows, he states, a charge for interest at the rate of 36% per annum. It is really at a much higher rate. If the £16 9s. were to be paid in one sum at the end of the twelve months his figure would be correct, but the debt of £12 2s. 1d., plus interest £4 6s. 11d., is to be paid off by equal monthly instalments of £1 7s. 5d., which makes the charge for interest at the rate of about 60% per annum. [A correspondent last week calculated this rate to be approximately 86%.—ED.] Similarly the case mentioned by "Shylock" in your issue of 12th October would work out, not at 17% as stated, but at 33% or thereabouts.

It is to be hoped that purchasers on these terms are fully aware of the charge made for the accommodation granted to them. On the other hand, the risk of loss incurred by the sellers in such transactions, unless security be obtained, must be borne in mind. S 8688.

Midlothian.

Books & Maps for Motor Cyclists.

"THE MOTOR CYCLE" ROUTE BOOK.
With 32 pages of Road Maps. Price net, 2/6. By post, 2/10.

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., Dorset House, Tudor Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 1½d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the top left-hand corner of the envelope, and should be kept distinct from questions bearing on technical subjects.

ROUTES.—By special arrangement with the Automobile Association and Motor Union, readers of "The Motor Cycle" desiring routes may enjoy the benefit of the Road Service Department of that organisation. Queries should be addressed to the Editor in the ordinary way (enclosing a 1½d. stamp), and will be dealt with by the A.A. and M.U., who are regularly in receipt of reports from their representatives all over the country as to the existing state of the roads in any particular locality

A MIXED OUTFIT.

Would a Scott sidecar fit on to a 1910-11 Triumph machine? There being no top tube on the Scott I wonder if it will affect the fixing of the sidecar in any way.—H.A.H.

If the sidecar is a standard Scott model it would be possible to fit it to an old Triumph machine with a little modification of the connections; this would be a matter for experiment, but any good mechanic should be able to carry out the work.

WON'T GO ON TOP GEAR.

I possess an old four-stroke Calthorpe two-speed (foot operated) machine, and have recently had both valve seatings rebuilt and machined. The machine gives every evidence of good compression. Upon taking it on the road, however, it will not go on top gear, owing to some inexplicable reason. I have had the engine to pieces, and as far as I can judge there are no defects, with perhaps the possible exception of loose connecting rod bearings. The belt is also worn. Would these defects cause the strange lack of power when the cycle is in top gear? I have never been able to get the engine to smoke. Is this anything to do with it?—L.J.H.

It is difficult from your description to diagnose the exact cause of your trouble, as many factors may combine to produce such results. Loose connecting rod bearings and a worn belt should not have the effect of reducing your power appreciably, provided that the play in the former is not excessive, and that the latter is still capable of gripping the pulley flanges without slipping. Your remark regarding failure of the engine to smoke encourages the idea that the lack of power may be due to faulty lubrication, and we should recommend a thorough overhaul of the oiling system. Of course the large combined gear box and crankcase on this machine allows a greater quantity of oil to be pumped in without causing smoking than the average engine will take. Make quite sure that the valve and ignition timing is correct. The magneto, if fixed ignition, should be set so that the spark occurs about four millimetres before top dead centre.

Important Dates.

Sat., Nov. 25th, to Sat., Dec. 2nd—Olympia Motor Cycle Show.

Tues., Dec. 26th, and Wed., Dec. 27th—M.C.C. London-Exeter Run.

Sat., Jan. 13th, to Wed., Jan. 24th (1923)—The Belgian Salon.

Fri., Jan. 26th, to Sat., Feb. 3rd (1923)—Scottish Motor Show.

REMOVING A PINION.

How is the half-time pinion which operates the exhaust valve cam wheel removed from the crankshaft on an old twin Rex engine which has automatic inlet valves?—E.B.H.D.

You do not give the date of your engine, but if it is of the 1908 to 1910 variety, the small timing wheel on the main shaft is a pressed fit (parallel shaft) and it is located by a small grub screw half in the shaft and half in the pinion. A sprocket drawer should be used to remove it or perhaps the hook ends of two long tyre levers could be used to prize it off.

SMALL CAR PROGRESSION

"THE AUTOCAR"—published from the offices of "THE MOTOR CYCLE" and conducted on the same enterprising lines—is the complete automobile journal embracing small, medium, and large cars. Every motor cyclist contemplating the purchase of a light car should read

The Autocar

Every Friday **4d.**

Founded in 1895, "THE AUTOCAR" is the largest and most successful automobile paper and enjoys the greatest circulation. It is universally accepted as the representative British motoring journal.

OILED-UP REAR CYLINDER.

On a 1921 770 c.c. twin B.S.A. (solo) I find that the back plug is unduly prone to oil-up, particularly on short hilly runs, necessitating changing plugs or taking out the plug in use to clean it. The front plug gives no trouble, merely carrying a light deposit of dry carbon which does not impair its working power. Is this defect due to the oiling system or could it be caused by over-oiling? If the latter, should not the front plug also suffer?—(I.D.710).

Over-oiling of the rear cylinder of a V-twin engine used to be quite a common fault, and you will probably overcome the trouble if you curtail the oil supply slightly. If this is not effective it might be possible to arrange the oil pipe inlet to the crank case in a different position, say at the back of the front cylinder. Consult the makers as to modifications on later models; yours appears to be an isolated case, however. If you cut down the oil supply drastically, add a little oil to the petrol for the benefit of the valves and pistons.

"WITH CASH ADJUSTMENT."

About two months ago I agreed to effect an exchange of my sidecar for a solo machine and cash to value of £24 10s.; the other party paid down £12 and signed an agreement to forward £8 in cash within twenty-four hours, and the remaining £4 10s. within one month. He sent the £8 as agreed, but did not send on the £4 10s. when the month had expired. I wrote on three occasions asking for the balance, but he said he refused to pay any more as the sidecar was faulty. As a matter of fact the machine was in splendid condition when he took it over, and I wished the following day I had not parted with it. What is the best way for me to obtain redress?—S.D.W.

From the facts stated, the person who took over your machine should have satisfied himself as to its condition before he agreed to the bargain, and if he did not do so, it is his own fault. As you cannot obtain the balance of £4 10s. you should commence County Court proceedings for its recovery, especially as the purchaser made a further payment of £8 on account without making any complaint after the machine was in his possession.

OCCASIONAL MISFIRE.

[?] I have a 595 c.c. 1920 Douglas. The engine has recently been cleaned and valves ground in. I now find that an occasional misfire occurs at intervals. It is rather peculiar inasmuch as it is worse on top gear, occurring about every 300 to 500 yards, while on second gear it does not seem to miss at all, or very occasionally. The magneto and plugs have been tested, and I have cleaned the carburetter. Valve clearances are correct—in fact, everything seems mechanically perfect. In appearance the trouble would seem to be an occasional short circuit somewhere, but if it were so, why does it appear only on top gear and not on second or third? Therefore to me it does not seem anything to do with the sparking system.—C.E.M.

From your description, which does not reveal any actual defect, we should be inclined to attribute your trouble to a sticking inlet valve. It is possible that one of the valve stems is rather tight in the valve guide, possibly due to congealed oil which occasionally prevents the valve from operating correctly. Thoroughly cleaning and polishing with fine emery cloth is the remedy. Make sure that the contact breaker rocker (or roller, according to the make) is quite free.

EXPERIENCES WANTED.

Readers' replies to questions published under this heading should be addressed c/o The Editor, "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4, when they will be forwarded direct to the querists concerned. Requests for experiences should be accompanied by a stamp.

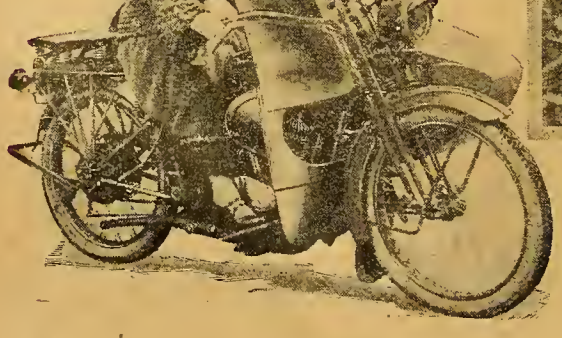
"J.M." (Ross).—350 c.c. De Luxe Barr and Stroud, Model D.

"J.W.M." (London).—Gibbons cycle car with Coventry-Victor engine; belt wear.

"W.A.F." (Wellingborough).—Carden, 1921 or earlier model.

"H.B." (Manchester).—Scott Sociable with wheel steering: suitability for driver with partially-disabled left hand.

"J.L.F." (York).—Cure for persistent valve breakages on 398 c.c. A.B.C.; suitable jet, fitting of two-lever carburetter or extra air valve.



SPARKLETS

Accommodation During the Show.

Provincial members of the A.C.U. may obtain information at Stand No. 6 at Olympia, as to the accommodation available to them during their visit to London.

Discontinued.

The Coventry Chain Co., Ltd., advises us that it no longer has any interest in the production of the chain rivet extractor which we illustrated on p. 662 of our November 9th issue. It is now marketed by Saxelbys, Ltd., of Coventry.

A New Rubber Compound.

Containing an admixture of mica which gives properties making it resistant to the deleterious effects of heat, a variety of rubber known as Mintite Finished will be included amongst the products of A. Roberts & Sons, Ltd., and W. A. Bates, Ltd., at Olympia.

A Wanderer.

Not long ago Zenith Motors, Ltd., had a letter from a dispatch rider at Cologne asking for spare parts for a Zenith Gradua; by the frame number they were able to identify the machine as one made for the Russian Army and shipped through the Ministry of Munitions in 1916. The rider writes: "I have toured 12,000 miles under all sorts of conditions in Poland, Upper Silesia, and Germany, and have never had to stop for any sort of trouble except for the tyres, which are of German make."

Experienced T.T. Riders Only.

Several riders with T.T. experience are needed by a well-known manufacturer in 1923. Letters should be addressed to "Tourist Trophy," c/o The Editor, *The Motor Cycle*, Dorset House, Tudor Street, London, E.C.4.

Range of Friction Gear Ratio.

In our description of the friction-driven Economic lightweight, the range of ratios provided was stated to be between 6 to 1 and 9 to 1. The makers, however, state that the low gear is 19 to 1, thus the range is extremely wide.

Wireless on a Sidecar.

It is not generally known that the Metro-Tyler Co., Ltd., Banister Road, Kilburn Lane, London, N.W.10, are manufacturers of wireless outfits and at the Olympia Show they will exhibit a sidecar saloon body fitted with wireless installation and frame aerial.

Efficiency and Silence.

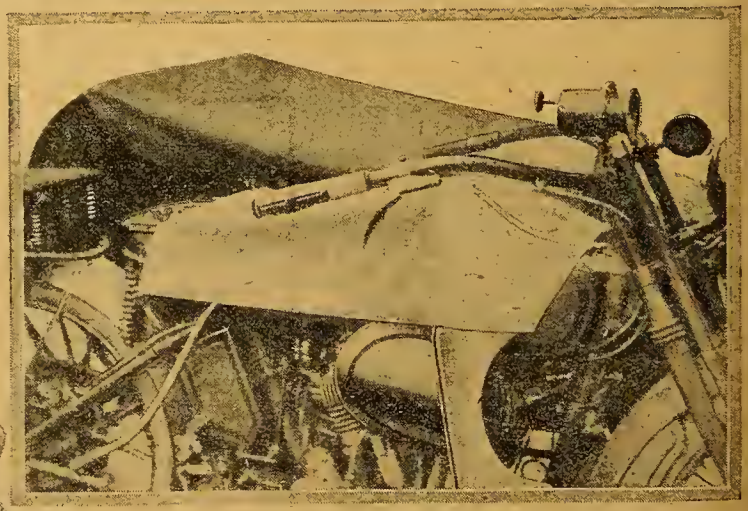
In reference to the impression which may be current that the quieter running G.N. engine is not so efficient as the older type, the makers claim that despite a heavier body the new side-valve twin models are equal to the overhead inlet type in general performance.

Catalogue Received.

The Athol Engineering Co., Peru Street, Higher Broughton, Manchester: Particulars of celluloid sheeting such as is used for sidecar windscreens.

Catalogues Wanted.

Catalogues of motor cycles, cycle cars, and accessories which will be exhibited at the Motor Cycle Show at Olympia, are urgently needed by the Auto-Cycle Union. They should be addressed to The Secretary, 83, Pall Mall, London, S.W.1.



PROTECTION FOR THE DRIVER.

Not only does the T.O.M. Shield provide the equivalent of a high dash, which is surmounted by a small aero type windscreen, but wind scoops are incorporated which deflect the rush of air on to the cylinders. The shield can be folded down to cover the saddle when the rider is dismounted, thus keeping the machine dry. When in use, great protection from the elements is afforded

STAND 97 OLYMPIA

RUDGE-WHITWORTH Ltd.

(Dept. 600) - COVENTRY.

LONDON: 230, Tottenham Court Road, W.1

The Ruby Cycle Co., Ltd., in voluntary liquidation.

FOR SALE IN ONE LOT AS A GOING CONCERN

F. S. AIREY, ENTWISTLE & CO.
IN CONJUNCTION WITH
Messrs. LOMAX, SONS & MILLS

have received instructions to offer for SALE BY AUCTION at the Thatched House Hotel, Manchester, on TUESDAY, DECEMBER 12th, 1922, at 2.30 o'clock in the afternoon prompt, subject to conditions,

MODERN WORKS known as the

ROYAL RUBY CYCLE WORKS

situate at ALTRINCHAM, near Manchester, and the FIXED AND LOOSE MACHINE TOOLS, DEPARTMENTAL PLANTS, Electric Power Plant, Office Furniture, Loose Tools, Jigs, Patterns, Drawings, and Goodwill of the Business. Also THE STOCK-IN-TRADE, WORK-IN-PROGRESS, New Cycles and New Stores, Three Motor Vehicles, and Manager's House.

THE LAND forming site of the Works and held in connection therewith contains a total area of 19,724 sq. yds. and is freehold and free from chief rent (about 6,000 yards are vacant in addition to the Yard space).

THE BUILDINGS ARE MODERN, the major portion being completed in 1920, whilst the older parts were erected in 1915 and 1910 and contain a total floor area of over 8,600 sq. yds., mostly of lofty one storey Shed construction, withadministrative block two storeys high, having suitable elevation to Moss Lane, with excellent suite of General and Private Offices, etc.

THE MOTIVE POWER is electricity, the current being derived from the Altrincham Electric Supply Co., Ltd., and the Plant includes: 8 Transformers, 14 Electric Motors, and about 800 ft. of Shafting.

THE MACHINE TOOLS AND PLANT embrace about: 140 MACHINE TOOLS suitable for the Cycle Trade, fully equipped departments for Lining, Enamelling, Plating, Brazing, Polishing and Sand Blasting, together with all Loose Tools, 220 Fitters' Vices and Benches, Gas Producer Plant and Dust Extractor Plant for the Polishing Shop, Office Furniture, etc.

Manager's Dwelling House known as "Rosslyn" situate in Bentinck Road, Altrincham, subject to Chief Rent of £5 per annum.

The Works were in full or part operation up to a few weeks ago and are capable of an output of about 2,500 Motor Cycles and about 10,000 ordinary Cycles per annum.

Schedules of the Plant and Stocktaking may be inspected and other information regarding the trading of the Company may be obtained from the Liquidator by appointment.

Printed particulars, Conditions of Sale, and orders to view the Works may be had from F. S. Airey, Entwistle & Co., Auctioneers and Valuers, 10, Norfolk Street; the Liquidator, Mr. R. H. Lord (Messrs. J. B. Boyd, Wrigley & Co.), Chartered Accountant, 53, Brown Street; Messrs. Lomax, Sons & Mills, Auctioneers and Valuers, 2, Booth Street; or from MESSRS. SALE & CO., Solicitors, 29, Booth Street, all of Manchester.

IVY MOTORS

Stand 64—Olympia

The New 2¾ H.P. (Four Cycle) Ivy will be on show — in addition to our well-known 2½ and 3 H.P. Two Stroke Models.

A substantial reduction has been made in prices but the quality has not been reduced.

9, Hammersmith Road, Olympia.

SEE these wonderful AIR CUSHIONS AT STANDS

LEO SWAIN, GAMAGES, ELLISON & Co.

For the Motor Cycle or Sidecar Owner, THE MORLEY SELF-CONTROLLED AIR CUSHION is a splendid adjunct, as it is for Light Cars, Morgans, Runabouts, Sidecars and Dickey Seats, being as safe and comfortable as it is most decidedly economical. ORDER a MORLEY SELF-CONTROLLED AIR CUSHION, POSH BAG, MOTOR CAR SEAT, or PILLION SEAT, Full Sized or Single Bed NOW, and you'll never have anything else. *Enquiries may be addressed, or orders sent direct, to THE SELF-CONTROLLED AIR CUSHION CO., LTD., or through any Garage, House Furnisher, Motor Accessory Dealer, or Department Store.*

This patent method of making Seats, Cushions, Beds, etc., is revolutionising an Industry, and the big Motor Car and Shipping Firms, Hospitals, and similar Institutions, have quickly perceived the many advantages of this Controlled Air-System.

HOW TO ORDER.

FIRST make a paper pattern to the EXACT size of the seat bottom required, making sure that the corners are given correctly. Also distinctly mark on the pattern which is the front edge of the Cushion.

SECONDLY, give the depth of Cushion desired at the FRONT ONLY. We can then make to fit your seat perfectly.

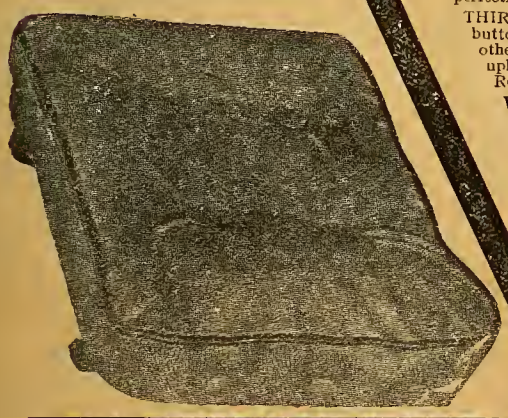
THIRDLY, state whether a pleated, plain, or buttoned seat is required. This is necessary; otherwise we send the buttoned seat. Can be upholstered in any shade of either Leather, Rexine or Bedford Cord.

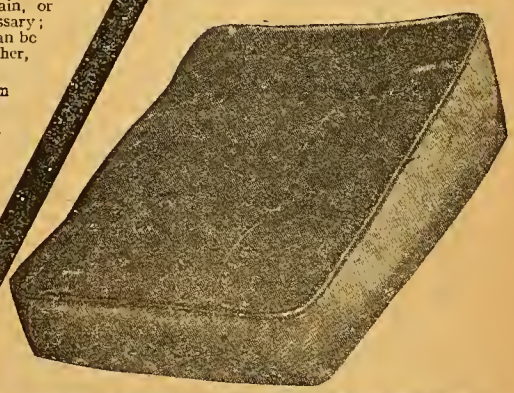
We send quotations immediately on receipt of Pattern.

ANY SEAT SENT ON APPROVAL AND CASH RETURNED IF UNSATISFACTORY.

Every Cushion Guaranteed 5 Years.

DURING SHOW WEEK THESE CUSHIONS ON VIEW 9, HAMMERSMITH ROAD, opposite Olympia.





THE SELF-CONTROLLED AIR CUSHION Co. LTD.

CLIFTON STREET, NEWTON HEATH,

MANCHESTER.

50%

of motor cycles awarded "firsts" at Brooklands this year were fitted with "M-L" Magnetos.

First machine to lap at over 100 miles per hour (M. Le Vack riding a Zenith Jap) was fitted with an "M-L" Magneto.

The Magneto which stands up to the Brooklands Track work will give you the efficiency and reliability you want.

See the

Cobalt Steel Magneto

at Stand No. 267 Olympia.

All enquiries and correspondence relating to overseas trade and to retail and trade business in this country should be addressed to Messrs. S. Smith & Sons (M.A.) Ltd., Central Works, Cricklewood, N.W.2. Sole Makers: The M-L Magneto Synd. Ltd., Coventry, to whom all enquiries from manufacturers should be sent.

If it's an "M-L"—you can rely on it.

At Stand 252 OLYMPIA.

Patented at home and abroad.

Illustration with part of the felt and Rexine cover cut away to show construction of saddle.

You will see the wonderful floating

"TERRY"

spring seat saddle.

We invite you to come and see it, sit on it, test it, and discover its real good qualities—so you may have it on your 1923 model.

If you cannot visit the Show, write now for literature describing the saddle and its successes —post free.

Herbert Terry & Sons, Ltd., Manufacturers, Redditch, Eng. Est 1855.

TRADE MARK.

I.

Just a line to let you know the benefit I have received from your spring seat saddle. I have had 3 operations for internal trouble, and had been compelled to give up riding. I bought one of your saddles and have done thousands of miles without further trouble.

G.K.

II.

From Tanganyika, E. Africa.

Whilst home on leave I purchased a spring seat saddle. It has been a perfect 'God-send' on the terrible up-country roads here, than which there are none worse. It is the admiration of all riders.

A.W.F.

III.

Selections from many similar appreciations.

You will be pleased to hear that the "O.K." team in the recent "6 Days" was awarded the Team Prize (350 class) and 3 Gold Medals. We all used your spring seat saddles. They make an uncomfortable job comfortable.

N.H.

THE MILLS PATENT.

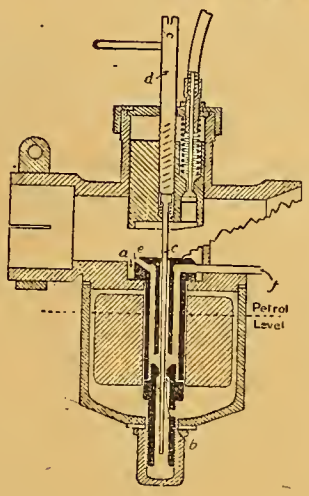
Fully Compensating CARBURETTER

Price £3 Any Size.

A very easy start is obtained by pressing float tickler, which creates a well of petrol at "*a*" which, by having throttle open only a little, is drawn into cylinder at first kick, so giving practically a petrol injection.

Opening and closing throttle enlarges and reduces jet "*b*" by means of tapered needle "*c*." A rich mixture for accelerating from cold is obtained by turning bar of needle adjusting rod "*d*" to the left (anti-clockwise looking at top of carburetter); one complete turn raises or lowers needle one-quarter of an inch, so enlarging or reducing the jet.

The carburetter compensates itself for different speeds of the engine as follows: As engine speed rises, the suction on outlet jet "*e*" increases, but, owing to the fact that air offers less resistance than petrol, air is drawn down orifice "*f*," brought from outside of carburetter by means of the compensating tube, and so causes a gradually weakening mixture.



As engine speed falls when hill climbing, so the suction on jet "*e*" falls, but as the jet "*b*" is below petrol level the same amount of petrol is flowing, but less air is drawn down orifice "*f*," causing a gradually enriched mixture to be supplied.

It will be clearly seen that at no time does neat petrol issue from jet "*e*." At all throttle openings and speeds of engine, air is drawn from "*f*," which mixes with petrol from "*b*," issuing from "*e*" in the form of petrol vapour. This gives us a real "atomised spray" carburetter at all throttle openings and speeds, including "pilot."

The petrol level has no influence on the working of the carburetter so long as it is above the lowest part and below the highest part of the tube or passage connecting primary jet "*b*" with secondary jet "*e*."

The jet being in centre of float chamber, the tilting of machine either uphill or downhill does not alter mixture in any way, and machine has to be laid down almost horizontal before flooding occurs.

If correct needle has been fitted, carburetter will give correct mixture at all positions of throttle and all speeds of engine.

Messrs. MARTINSYDE write:—

"Referring to the Mills Carburetter we have on trial, we are pleased to tell you that we have obtained excellent results in slow running, acceleration, power, and speed; the petrol consumption appears to be normal, and the mixture even throughout the full range of throttle opening."

Messrs. VELOCE, makers of the "Velocette," write:—

"The small carburetter gave us great satisfaction."

The *Daily Mail*, May 18th, 1922, criticising the Calthorpe motorcycle fitted with a Mills Carburetter, says:—

"A large part of the engine's good running I attribute to the Mills automatic compensating carburetter; never once, even downhill, did the engine four-stroke. The engine seemed to get a perfect mixture at all throttle openings. It gave easy starting, good power and speed, steady slow running, and good consumption."

Messrs. EXCELSIOR MOTOR COMPANY (per Mr. Carson) write:—

"The carburetter fitted on to the twin machine has been tested in Devonshire and Somerset over a something like 400-mile journey. It has proved exceedingly satisfactory, and we can in no way suggest any improvement. It is the most satisfactory carburetter that we have tested. On a vehicle weighing 6 cwt., and carrying 30 stone of passengers and luggage, averaged 50 miles per gallon in hilly country. The engine starts quite easily, and the machine is most simple to control. The writer understands, on inquiring, that the lightweight carburetter is giving equal satisfaction on the Villiers engine."

Mr. R. O. CLARK, of Norwich, winner of the Junior T.T. Race (250 Class) 1920, writes:—

"With regard to the carburetter, I am pleased to state that I am very satisfied with this."

Mr. DAN BRADBURY, the Norton specialist of Sheffield, writes:—

"I beg to state that the Mills Carburetter is giving every satisfaction, and is excellent in every way."

A large number of motorcycle manufacturers are fitting it, including B.S.A., Norton, James, Excelsior, Calthorpe, Radco, Sun Vitesse, Alldays & Onions, etc., whilst any maker can fit it without extra cost if you specify it.

For one month from November 22nd we will allow up to 20/- for your old carburetter. If new condition, 20/-; if good condition, 15/-; if fair, 10/-; if old but usable, 5/-.

If you will try our carburetter, send along full particulars of engine, enclosing £3 as deposit, when carburetter will be sent on 14 days' trial. If you return it, we refund your deposit less any damage and out of pocket expenses, minimum 5/-. If you want to keep it and would like an allowance for your old carburetter, send it along, and we will send P.O. to value as above.

TWO-STROKE MOTOR CYCLES

By the Staff of
"The Motor Cycle."

Second Edition
(Revised)

THIS useful and interesting treatise should be studied by all to whom the fascinating two-stroke makes an appeal. It fully describes the engine and other units and shows how the rider may get the best results on the road. Numerous illustrations are included.

Price 2/6 net. By Post, 2/9.

From ILIFFE & SONS LTD., Dorset House, Tudor St., London, E.C.4, and leading booksellers.

The BRAMPTON Bi-Flex SPRING FORK

A Motor Cyclist recently wrote us that, since fitting the "BRAMPTON" Bi-Flex Spring Fork, the comfort of his machine has been trebled, and it steers itself almost without assistance.

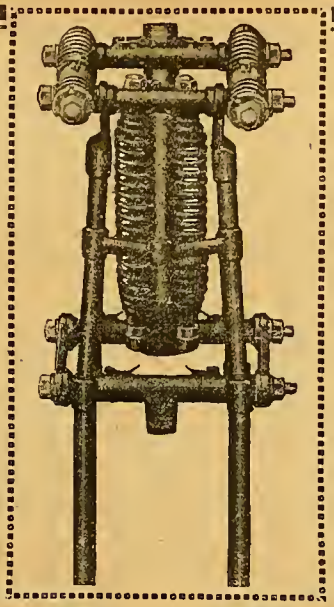
Whilst the above unsolicited testimony most adequately represents the unanimous opinion of all users, the forthcoming Motor Cycle Show will provide further indisputable evidence of the universal popularity of the "BRAMPTON" Bi-Flex Spring Fork by the large number of machines exhibited in which this Fork is incorporated as a standard fitment.

An opportunity will also present itself for Motor Cyclists to inspect the various models which we make at our Exhibit on

STAND No. 258, GALLERY

where a cordial invitation is extended to all visitors to the Exhibition.

——BRAMPTON BROS. LTD.——
Oliver Street, Birmingham.



The BRAMPTON
(Shock Absorbing)
SPRING CHAIN

This Chain combines and affords the advantages of both Chain and Belt without the disadvantages of either. Whilst positive in its action, it is as resilient as a belt, transmitting the power generated by the power unit with minimum loss, and completely absorbing all shocks from engine impulse which are transmitted to the driven wheel.
The "BRAMPTON" Spring Chain thus affords a maximum of comfort for the rider and a minimum of wear on his tyres. All the bearing parts of the Chain are cushioned by springs, as indicated in the illustration below, and can only be brought into contact as the resistance of the springs is overcome. There is, therefore, no hammering of parts, and as a result the life of the Chain is enormously increased.
Conspicuous successes were achieved by Motor Cycles fitted with this transmission during the past season, and it is now to be seen incorporated in some of the best known makes of machines. It will be exhibited, among other types of Chains of our manufacture, on

STAND No. 258, GALLERY

Your inspection is invited.

Commercial Publicity

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words 3/–, and 3d. for every additional word. Paragraphs of under 8 words are charged double rate. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable to ILIFFE & SONS Ltd., and crossed & Co. Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," by the first post on Friday morning previous to the day of issue. Advertisements that arrive too late for a particular issue or that are crowded out will automatically be inserted in the following issue unless accompanied by instructions to the contrary.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "The Motor Cycle," Dorset House Tudor Street, London, E.C.4. *Readers who reply to Box No advertisements are warned against sending remittance through the post except in registered envelopes; in all such cases the use of the Deposit System is recommended, and the envelope should be clearly marked "Deposit Department."*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the machine offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor. Carriage is to be paid by the buyer, but in the event of no sale each party pays carriage one way. The seller takes the risk of damage in transit. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6 and on all transactions over £100, ½%. All deposit matters are dealt with at Dorset House, Tudor Street London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

Matador.

DIFFERENT but better, that's the Matador!!

OUR Experience of Bradshaw engines, and the wonderful results obtained, have decided us to take up this machine without hesitation.

FOLLOW the decision of the men who know from experience and buy one. Its success in the coming year is assured, and we will help you to success if you are a competition rider, and to the joy of comfortable no-trouble touring if you require a machine for this purpose.

IT is 2¾h.p., with o.h.v. Bradshaw engine. The oiling is automatic and cannot get out of order, it cannot overheat, the three-speed Burman gear box is delightful, and with 700×80 tyres road shocks are oil. Speed!! Well, 70 m.p.h. on the Sports. The price is right, too; £75.

IT will not be at Olympia, but very close to it; don't leave it to the last minute; see us to-day about it.

MATADOR! Matador! Matador!!—Keep it in mind and look for the man with the Allan Gruzelier badge at Olympia.—Allan Gruzelier, Ulster Chambers, 168, Regent St., W. [2451

This 2¾ h.p. BURLINGTON DOUGLAS

FREE

Great New 'Burlington' Competition.

Have you sent in your suggestion for a slogan for our sidecars?

TO further popularise our well-known Sidecars, we are instituting the following interesting competition, in order to obtain a really good slogan for these Sidecars.

NOTE.—The type of slogan required is something similar to "Luxury Products at Economy Prices," or "Best on the Long Run."

All that is necessary is to send in your suggestion for a slogan, accompanied by an order for goods to the value of not less than 2/6.

Every 2/6 entitles you to send a suggestion. Eight suggestions must be accompanied by an order to the value of £1.

SEND YOUR SUGGESTION EARLY

An abbreviated List of spares and useful accessories will be found under our advertisement in the Miscellaneous columns.

What's yours for 1923?

Let our Representatives, who will be in attendance at the Show, advise you on your mount for next year. We can supply any machine for cash or deferred payments.

BURLINGTON

AMAZING Offer.

COUNTY of London Engineering Works, Ltd.

WE hold the largest and most varied stocks of magnetos and spare parts in England, our stock comprise of over 30,000 magnetos, and an inside estimate of our spares is £250,000.

WE would bring to your notice that these magnetos are not old disused magnetos painted on the outside to look like new, like many being offered to the public by so-called magneto specialists and experts, but are new unused Government surplus, and every magneto previous to being sold is thoroughly overhauled, and subjected to the same test as by the makers.

GUARANTEE.—These magnetos are all fully guaranteed for 12 months against all defects, and should any magneto at any time within this period prove in any way defective, we will willingly exchange or repair same free of all charge.

APPROVAL.—Notice all goods sent on approval for 14 days, per return of post on receipt of cash, and in the unlikely event of these goods not meeting with your entire approval, we will willingly refund cash in full, making no deductions for packing or carriage. Magnetos despatched through this paper's deposit system if required.

IGNITION, LIGHTING, ETC.

RELIANCE Magneto Repairing Co.

RELIANCE for Repairs, new magnetos, and spare parts of every description.

RELIANCE have the largest and most up-to-date repair factory in London or Provinces.

RELIANCE carry out all repairs on the premises, including armature winding. Trade inquiries solicited.

RELIANCE have one of the most modern armature-winding plants and test rooms in the country, and can therefore offer you the following advantages:—

TIME.—All work within 6 to 48 hours, and a solid 12 months' guarantee in writing to back it up.

CHARGES.—No flat rates. You are charged according to the work that is required; therefore you are not in some cases helping to pay for other people's repairs.

OUR Offer.—We shall be pleased to allow you to see your magneto on test after repair at our works. How many others can make the same offer?

RELIANCE have the following magnetos in stock, all fully guaranteed and on approval.

THOMSON-BENNETT.—Singles and twins, new, any degree, waterproof, variable, suit any engine; price 55/-.

C.A.V. Singles and Twins, new, ideal for any lightweight, 2½h.p. and 4h.p. Douglas; 55/-.

BOSCH, Type Z.A.2, second-hand, enclosed, waterproof, variable, latest pattern, for Douglas 2½h.p. and 4 h.p.; £4/10.

ACCUMULATORS, best makes only, for all purposes, any voltage, charged and uncharged, always in stock; send for prices.

BOSCH Enclosed, waterproof, type D.A.L. magnetos, Government surplus, any degree, ready to fit on Indian, Harley, J.A.P., or any big single or twin. We guarantee these to give you slow running and easy starting, and they are in every way ideal for the big machine; price, carriage paid, £4/10.

GUARANTEE.—Every magneto, no matter what the price or make, is guaranteed by us. Not merely that same is in good order at time of sale, but a plainly written statement that we guarantee each machine against all defects for a period of 12 months. This, we maintain, justifies us in charging a few shillings more than certain of our competitors. List sent post free upon application.

RELIANCE were established in 1914, since when we have enjoyed a reputation which is second to none for straight and fair dealing.

IGNITION, LIGHTING, ETC.

MAGDYNAMO Engineering Co., Ltd., for magnetos, spares and repairs.

MOTOR Cyclists fit reliable high quality magnetos now and avoid certain failure of inferior magnetos.

BOSCH Enclosed Waterproof Type D.A.L. Magnetos, Government surplus, ready to fit on Indian, Harley, J.A.P., or any big single or twin, gives powerful spark at all engine speeds, makes your engine a real live engine, give you easy starting, smooth and rapid acceleration, high speed, and low fuel and oil consumption with increased power; price only £5 each, postage 1/6 extra; a 12 months' written guarantee sent out with each magneto. We give you satisfaction or refund cash.

PLEASE note the above type magnetos were originally manufactured for 200h.p. aircraft engines; therefore we have every confidence in claiming them to be the magneto you require for your big machine. Fit one to-day, and see life with a live machine.

HARLEY-DAVIDSON Owner writes: "Magneto to hand; many thanks for prompt despatch, satisfactory in every way; will recommend to my friends."

ZENITH Owner writes: "Since fitting magneto have completed a run of 250 miles; highly satisfied; will certainly recommend these magnetos."

INDIAN Machine Owners.—Your high-class machine deserves a high-class magneto. We want 1,000 Dixie 42° magnetos; send your magneto and £4 now, and we will immediately despatch you a Bosch D.A.L.

READY to fit on your machine; there are no alterations to make.

WHY is it that the leading Motor Cyclists—the men who know—are almost all sending to us for their Magnetos?

THERE must be a reason; there is; it is because the Magnetos of quality and guaranteed service, supplied by Magdynamo, beat all other Magnetos.

MAGDYNAMO will take your old Magneto in part payment

REMEMBER your magneto is sent on 14 days' approval against cash per return on receipt of your order; there is no obligation to keep it until you have used it for 14 days on your machine and are satisfied; let us send you one now.

ARE You a Discerning Douglas Owner? Do you want a reliable magneto with 12 months' guaranteed service that will give you starting without worry, a smoother running, and more powerful engine and better results from your Douglas? Then send for a latest enclosed waterproof type Bosch XA2 magneto now; price only £5, carriage 1/6.

C.A.V. Magnetos (not converted starters), ready to fit on Triumphs, B.S.A.'s, Nortons, and P. and M.'s, with 12 months' guaranteed service, price £3/10, carriage 1/6.

THOMSON-BENNETT Magnetos latest enclosed waterproof type (not converted starters), ready to fit on 55° Clynos and 180° Douglas' machines, with 12 months' guaranteed service, price £3/10, carriage 1/6.

MOTOR Cycle and Car Owners, are you testing all your sparking plugs properly? Are you wasting ponnds yearly by throwing away good plugs? Fit a Bosch aeroplane hand starter magneto on your garage bench to-day and always have your sparking plug tester at hand, price £2, carriage 1/6.

TRADE discounts and export quotations.—Write, call, or 'phone for terms.

A YEAR'S guarantee on repairs. Before you scrap that magneto, whatever its condition, let us see it; we will rebuild your magneto to look and work like new, no matter what make, within 3 days or 24 hours if urgent, and return it with a written 12 months' guarantee. While your magneto is being repaired we can lend you another free of charge. We could not make these offers if we were not certain of the quality of our work.

YOUR old magneto will be equivalent to new at a low cost. Send us your defective magneto now.

EXPRESS Dixie Repair Service. Your Dixie magneto; no matter what size, rebuilt equal to new and returned in 12 hours, at 30/-; a small extra charge for necessary replacements.

C.A.V. Express Repair Department.—Your C.A.V. magneto, no matter what type, rebuilt equal to new and guaranteed for one year, returned in 12 hours, at 30/-; a small extra charge for necessary replacements.

ARMATURE rewinding, no matter what make, type, or size, 11/6. Wound cores from stock.

BEAVER! Beaver! Beaver!—A postcard will bring you particulars of our famous Beaver mascot for all types of cycles, combinations and cars.

SOMETHING NEW AT THE SHOW

Do not fail to see the ELECTRICALLY EQUIPPED DOUGLAS on the Powell & Hanmer Stand No. 254 and take the opportunity of seeing me about your 1923 Model. Get the finest value in the world by purchasing a CORAM-DOUGLAS which is GUARANTEED to do 55 m.p.h. You thus obtain a 1923 Model Douglas with the engine further increased in efficiency by the fitting of Radiated Pistons with Patent Twin Rings, Air Cooled Patented Valve Caps, Racing Valve Springs, and the famous Zoom Zoom Exhaust System, and other improvements—Tony Combined Footboards and Footrests, etc.

HERE ARE SOME OF MY SPECIALITIES TO INCREASE THE EFFICIENCY OF YOUR OLD MODEL—

TWIN RINGS. Two rings in each groove give more power—perfectly gas-tight joints—prevent carbonising as oil cannot pass them—wear indefinitely—need no running in.

For 2¾ h.p. Douglas, **1/6** each; 4 h.p. Douglas, 3 h.p. Royal Ruby, Williamson, and Humber Twin, **1/8** each; 4 h.p. Sunbeam, Triumph (pre 1919), B.S.A., New Hudson, Rudge, Precision, Singer, etc., 85×3 m/m, **1/9** each. All Blackburne engines, Triumph (post 1919), Rover, Premier, Dunelt two-stroke, etc., 85×2 m/m, **1/9** each. All 2¾ h.p. J.A.P. engines, 2¾ in.×3/32 in. **1/8** each. Other sizes quoted for on application.

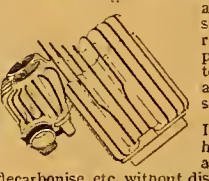
ZOOM! ZOOM!! The popular Exhaust System. Beautifully made, finished in burnished nickel or copper. A pleasant Zooming note without back pressure. Adds pounds to the appearance of any Douglas. Price **30/-** in copper finish, **33/6** nickel.

AIR COOLED VALVE CAPS. My latest are covered by patents. They never blow out nor seize in the threads. Absolutely gas-tight. Prevent knocking and keep the engine cool. Try them on your 2¾ h.p. or 4 h.p. Douglas, and if you are not absolutely satisfied have your money back. Price **4/-** each.

THE CORAM PISTON, fitted with radiating internal fins. Correctly designed, much lighter yet stronger than standard. Fitted with the patent twin rings in one groove. Complete with rings and gudgeon pin. Price **29/-** per pair. Insist on having these fitted when your mount is next down, and you'll never regret it.

THE TONY COMBINED ALUMINIUM FOOTBOARD AND FOOTRESTS. Beautifully finished—giving a natural riding position. A real solid cast job. Something that lasts for ever. Price **30/-** per pair complete.

WHY SUFFER BROKEN VALVES? My valves are guaranteed 12 months not to break, scale, or burn, and never really need grinding in. They cost more, but the best is the cheapest in the long run. 4 h.p. Douglas **10/-**, 2¾ h.p. Douglas **9/-**, complete with special spring, collar and cotter. Other makes, Triumph, Rudge, A.B.C., etc., price on application.



20% POWER INCREASE. This is what the new pattern cylinder gives a 2¾ h.p. Douglas. It has stream-lined ports, and large radiating fins. My price per pair is only **£5**. Fit them to any old model Douglas and you'll really be surprised.

Improved Cylinders for 4 h.p. Douglas with detachable heads, so that you can decarbonise, etc. without dismantling your engine, and which give 20% more power, **65/-** per cylinder.

4 h.p. and 2¾ h.p. **INSTRUCTION BOOKS, 1/6** each.

Any Spare Part by return of Post.

SEE ME AT STANDS Nos. 254 or 61.

THE PLUG WHICH NEVER OVERHEATS

Incandescent plug electrodes are a common cause of pre-ignition. This fault is completely overcome in the new Forward type "B" Plug which has a centre electrode of pure nickel no less than 3/16" diameter running right through the plug.

Do not fail to inspect this new plug together with the other Forward Accessories at OLYMPIA, STAND No. 293, Gallery.

For Rough Weather Riding

THE FINEST BOOTS OBTAINABLE

These wonderful bargains in the finest quality all leather foot-wear are the greatest boon any motor cyclist can have. They always keep the feet and legs dry, warm and comfortable, no matter how cold and wet the day may be. No motor cyclist can afford to be without them.

OFFICERS FIELD SERVICE TRENCH BOOTS

Note the Price

25/-

postage and packing **1/6** extra, all sizes.

Every boot is made of the finest quality Government leather, and is guaranteed to be brand new. They are particularly well made knee-high boots of very smart appearance. The uppers are soft and pliable, yet stout and durable. The full length tongues and side buckles effectively prevent any water penetrating. They are absolutely waterproof, extremely comfortable to wear and easy to slip on or off. In all sizes from 4 to 12, black or brown.

The smaller sizes suitable for ladies.

CALL and Examine them at our Showrooms

OFFICERS COLONIAL FIELD SERVICE BOOTS

Made of the finest Willow Calf procurable. Solid Leather throughout. The soles are 1 inch thick, the uppers soft and pliable. Acknowledged by experts to be the finest ankle boot ever offered to the British Public. In black or brown. Sizes 6 to 12. Our Price

Adjustable Side Screens for Matchless, 14/6 EACH

Messrs Atkinson's 49, County Road, Swindon.

Dear Sirs,—I should like to tell you how pleased we are with the screen. There was no difficulty about fitting it, and it fits the sidecar exactly and functions admirably. Before placing any order I went very carefully into the matter of the various makes of wind-screens on the market and am satisfied that I COULD NOT GET A BETTER.—Yours faithfully, W. E. LOWTHER.

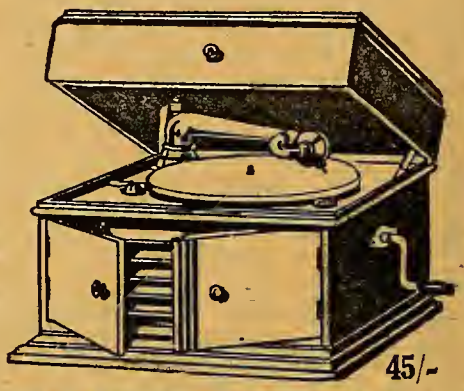
Protao Phone

SEE and HEAR THE PROTAOPHONE FOR VALUE, PRICE, AND MELLOW TONE

The Protaophone is the best bargain in Gramaphones to-day, not only for tone and appearance, but in actual price.

Protaophones can be supplied in the following prices:—



45/-, £3 15 0, £12 10 0

These are our standard machines, but we have many Protaophones at a cheaper price ranging from 30/- upwards.

Think! During the winter months you will not want to be out in the cold, but, if you acquire a Protaophone, your evenings around the fireside will be happiness itself.

A visit to our Showroom will convince you of the merits of the Protaophone, and we invite you to come and hear our machines at

PROTAO (Showroom) 88, Leadenhall Street, E.C. 3.

IF YOU WANT

"TRANQUILLITY"

IN 1923

you must be sure and see that your new machine is fitted with an

AMAC CARBURETTER

All the latest models, including the new ultra lightweight described fully in

The Motor Cycle, November 9th, page 673,
Motor Cycling, November 1st, page 788,

will be shown on our Stand at OLYMPIA.

TRADE MARK

Miracle Oil For All Motors

Unequalled for upper lubrication.

THE FINEST INVESTMENT EVER OFFERED TO THE PUBLIC.

A Startling Fact!

After you have bought your first 32 ounce tin of Miracle Oil for 12/6, you may continue to buy and use Miracle Oil year by year and it will not cost you another shilling.

A bold statement, but a **fact.**
The Reason. By the time you have used your first tin you will have saved your original outlay of 12/6.
This 12/6 saved will buy you another tin and this will keep on repeating itself.
This saving is effected by **increased mileage.**
By decreased wear and tear in the great reduction of **friction** and heat in the most vital part of your engine.
By prolongation of the life of your engine.
By greatly reduced expense—your engine needing to be decarbonised less frequently.
By reduced loss of the use of your car when this is being done.
By largely reduced upkeep cost.
In addition to the above you have the **superlative pleasure** of a sweet-running engine.
All this is the result of the **Perfect Upper Lubrication** obtained by the use of **MIRACLE OIL.**

BEWARE OF CHEAP IMITATIONS.

T.O.M.

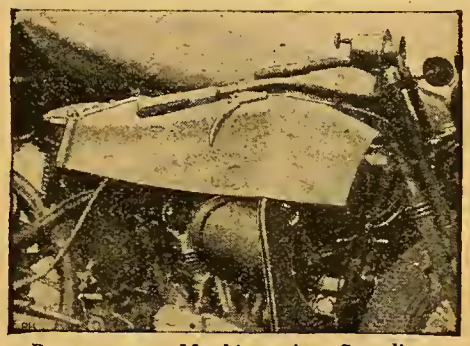
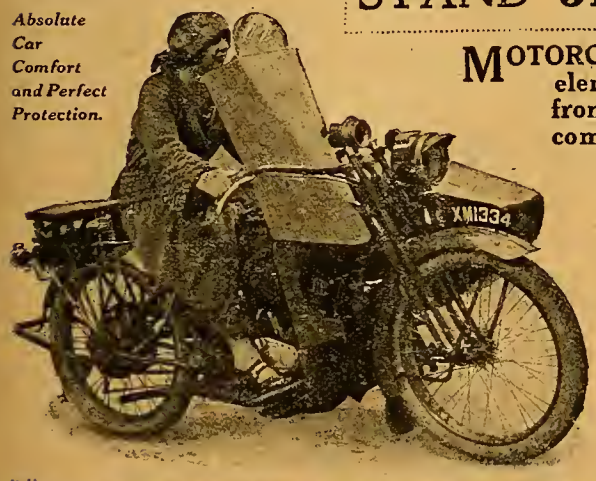
COMPLETE WEATHER PROTECTION FOR MOTORCYCLISTS.

MOTORCYCLE SHOW
STAND 51



Protects your Machine when Standing.

Absolute Car Comfort and Perfect Protection.



MOTORCYCLISTS can now have complete protection from the elements, from dust and dirt, from mud and water-splashing, from wind and cold, and at the same time unbelievable comfort even in inclement weather.

The T.O.M. Motorcycle Windscreen and Leg Shields have been perfected and tested under all conditions. Engine cooling has been allowed for, and the Shields do not collect but sheer off the dirt. Easily detachable. Handsome appearance. **When not riding is lowered to cover the machine to the saddle, thus protecting from rain.**

Easily fitted to any machine. Windscreen and Leg Shields priced separately or complete. Special windcuffs can be had if desired.

Write for full details or call at our Stand 51 (Olympia), or visit our handsome new Showrooms at

Messrs. Dunhills Ltd. are exhibiting Motor Clothing made up by them on their Stand No. 66, Ground Floor, at the Motor Cycle Show.

"Mintite" PATENT FINISH

Motor Cycle Tubes and Belts are being exhibited at the Motor Cycle Show on Messrs. W. & A. Bates, Ltd., Stand No. 179, Ground Floor; Messrs. A. Roberts & Sons, Ltd., Stand No. 4, Ground Floor

is a superior rubber finish giving the following advantages to

TYRES—WATERPROOF MOTOR CLOTHING

CYCLE BELTS—INNER TUBES

A permanent polished surface that does not crack.
Lubricating properties that prevent chafing and heating by friction.
Grease, Acid, and Heat Resistance.

THE AUTOCAR.—"The impression conveyed by examination of a section of a tube manufactured with the Mintite Finish is that the rubber is somewhat smoother than is normally the case, and that it has a slippery feel which is peculiar."

AUTO MOTOR JOURNAL.—"From the sample we have examined, it appears that the Tube is practically self-lubricating, so that friction between Tube and cover is reduced to the minimum."

MOTOR CYCLING.—"Judging by the sample which we have inspected the new Tubes possess a smooth almost silky external finish, which should ensure that the claims made for their cool running properties are not exaggerated."

INDIA-RUBBER WORLD, U.S.A.—"Quite a good polish is given to the Rubber Surface by its use."

DRAPERS' ORGANIZER.—"The samples we have seen should make highly superior waterproofs, i.e. for yachtsmen's wear and for other uses involving prolonged exposure to water.
"The surface evinces no disposition to crack or peel, and the mica should effectually prevent any development of stickiness."

THE LANCET.—"On Trial we find that acids and heat have little or no effect upon the material."

Olympia in 1922.

BUT twenty years ago the motor cycle industry was in its chrysalis stage. To-day it has assumed such vast proportions that over 100,000 machines are produced annually, and it has been computed that some thirty million pounds are invested in its factories, and that its annual wages bill approaches sixteen millions. Even so, the possibilities for the essentially economical motor cycle are unbounded, and only the fringe of a vast potential market has been touched. What are the portents for 1923?

Public interest has never waned. The desire to possess a motor cycle has never been absent. High prices and the fear of a material reduction after purchase were the reasons in numerous cases for the postponement of orders this year. Reliability has been demonstrated over and over again in trials in every part of the country; economical at all times, the annual running cost account has been materially reduced by reductions in prices of petrol, oil and tyres, so that 1923 holds bright promise for maker and user.

Without doubt the annual Motor Cycle Show at Olympia is, this year, more interesting than it has ever been, and a careful study of the machines exhibited reveals at least the very important fact that "freak" designs are absent. Never before perhaps have such sound mechanical principles been so general, and this reflects great credit upon the motor cycle industry as a whole.

The trend of motor cycle design forms the subject of a considered review in this issue, but three features at once arrest attention:

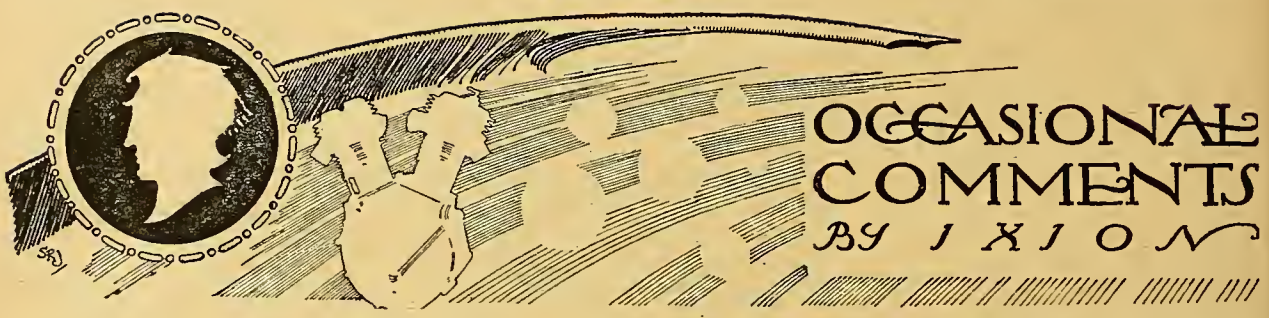
(1) The progress of the ultra-lightweight.
(2) The increased number of 350 c.c. motor cycles.
(3) The almost general adoption of chain transmission.

Of the ultra-lightweights it may be said that they are a revival of an old movement which never progressed because engine design had not reached the stage of efficiency which now obtains. These machines for the "man in the street" are to be found on over twenty stands, and of the total, 75 per cent. are entirely new models. Lightweight machines have always made a strong appeal to the convert by reason of their ease of handling, and it is a vast public which awaits the arrival of a light and economical mount of proved efficiency to take the place of the pedal cycle. In point of numbers, the 250 c.c. motor cycle of the conventional type easily maintains the position it gained at the last Show; but the 350 c.c. class is 50 per cent. larger—a fact attributable to its remarkable successes. Single-cylinder motor cycles of 500 c.c., although represented by a relatively smaller number than the 350 c.c. mounts, have also increased 50 per cent.; but the small twin-cylinder mount appears to be disappearing despite its charm.

A slight increase in the larger single-cylinder machine is to be recorded, but not to such a degree as one would expect, considering that this type of motor cycle represents the most simple and economical passenger machine, for even heavy duty, on the market to-day. The large sidecar outfit as a class has also increased slightly, but the opposed twin has no new names to represent it. Unit construction of engine and gear box seems to be more favoured than hitherto, while overhead valves and four-speed gear boxes are increasing in popularity.

Supported by an even larger number of manufacturers than any Show since the war, Olympia this year is well worth the visit of every motor cyclist, even if he resides a day's journey from the Metropolis; but for those who cannot attend—and for those who can—this issue of *The Motor Cycle*, with its complete description and specifications of the exhibits, will confirm that the advancement of design is indeed general.

An Index to the advertisements in this issue will be found on page xlii of Supplement.



Talk to Them.

I GENERALLY spend an hour at Olympia admiring the stand attendants, who meet such variegated queries with superb patience and courtesy. But they have a better time than the showmen at the car exhibition, who get far more tomfool questions in a day than the massed motor cyclists put in a week. Show visitors seem to fall into two main categories as hecklers. There is the superior individual, who walks briskly round with another obvious expert as a companion; scrutinises the machines rather haughtily; disdains the services of the stand attendants; and limits his rare queries to some technical fact. At the other extreme there is the earnest mug, who talks tripe by the hour at every stand. I will consequently betray the source of my happiest hours at Olympia. I catch an enthusiastic designer when he isn't busy, and let him spread himself as long as he likes to. He always draws my attention to some items which I should not have spotted or understood without his help, and his explanation of his reasons always gives one something to think about afterwards.

Lucky.

HOW fortunate for our hopes of eternal bliss that the ten commandments were enacted before motor cycles were invented. It is many years since I went to Sunday School; but, unless memory betrays me, there is one which denounces any mortal who covets certain things that don't belong to him. Moses framed it to keep wonderfully up to date, for he forbade the faithful to covet each other's houses and domestic servants, two commodities about which none of us have had many scruples since the war. But, mercifully, motor cycles weren't invented at that era, so a pious man can visit Olympia without committing deadly sin. At any rate, I hope so, for I am busily coveting some dozen machines which I have examined this week.

Dynamos Galore, but . . .

SHOW after Show passes, and each year I ransack both the floor and the gallery of Olympia in search of a cheap dynamo outfit, which I can transfer without trouble from one machine to the next, *e.g.*, from the baby two-stroke which I may be riding in January to the o.h.v. big twin which constitutes a man's mount in June. I have yet to discover a solitary example, and no doubt we must wait till dynamo lighting joins the magneto and the carburetter as a standardised component, which every engine is designed to take. In the meantime, there are two main alternatives before the rider who wants the best kind of electric lighting and yet changes his mounts often. One is a combined magneto-cum-dynamo; it is never cheap, but when you sell the machine, you can put the new mag. on the old 'bus and install your old dymag. on the new 'bus (unless, of course, you are switching over to a mount which uses a wholly different kind of magneto). The other is the kind of dynamo which employs a speedometer drive off the rear wheel. If anybody finds any sound alternative at the Show, I hope he will pass on the information to me, as I get many oversea queries on the point.

"Ixion's" "MOTOR CYCLE REMINISCENCES" are available in book form, price 2s. 9d. post free, from "The Motor Cycle" Offices, Dorset House, Tudor Street, E.C.4.

Going Down to the Sea.

MY remarks anent naval motor cyclists provoked a spirited letter from a ship's wireless officer, whose enthusiasm is as great as that of any R.N. officer, but whose leaves are briefer and less certain. Writing from Yokohama he enquires what can be done to facilitate motor cycling for "those who go down to the sea in ships," though he personally goes "down to the sea" in a train or a taxi. Answering his implied question first, I presume the ancient substitute for our modern "putting to sea" is ascribable to the curvature of the earth's surface not being understood, and the sea being regarded as a hollow. His main difficulty can only be solved in two ways. First, the crying scandal of seamen's licences should be tackled by some spirited representative of marine interests in Parliament. Second, the economic problem of providing machines for men who can only use them for a few weeks in the year admits of no really satisfactory solution. To own a machine permanently is wasteful under such conditions. To buy a new machine and sell at the expiration of leave involves heavy depreciation. To hire is costly. The plan I should personally adopt if I were a sailor would be to visit the big second-hand emporiums, and buy the best bargain I could find, getting my little brother to resell for me when my leave was up. Always supposing I could trust my little brother. Or perhaps one might trust one's girl. Or a pal. M'yes. Sailors who motor cycle might conceivably found a little club of their own. Each member to contribute a £10 share. The tenners to be expended on o.h.v. Nortons or other suitable machines. To be hired to members on leave at £1 per week. But to what condition would a sailor on leave reduce a machine in four weeks?

Occasional Comments.—

Windscreens for Parrots.

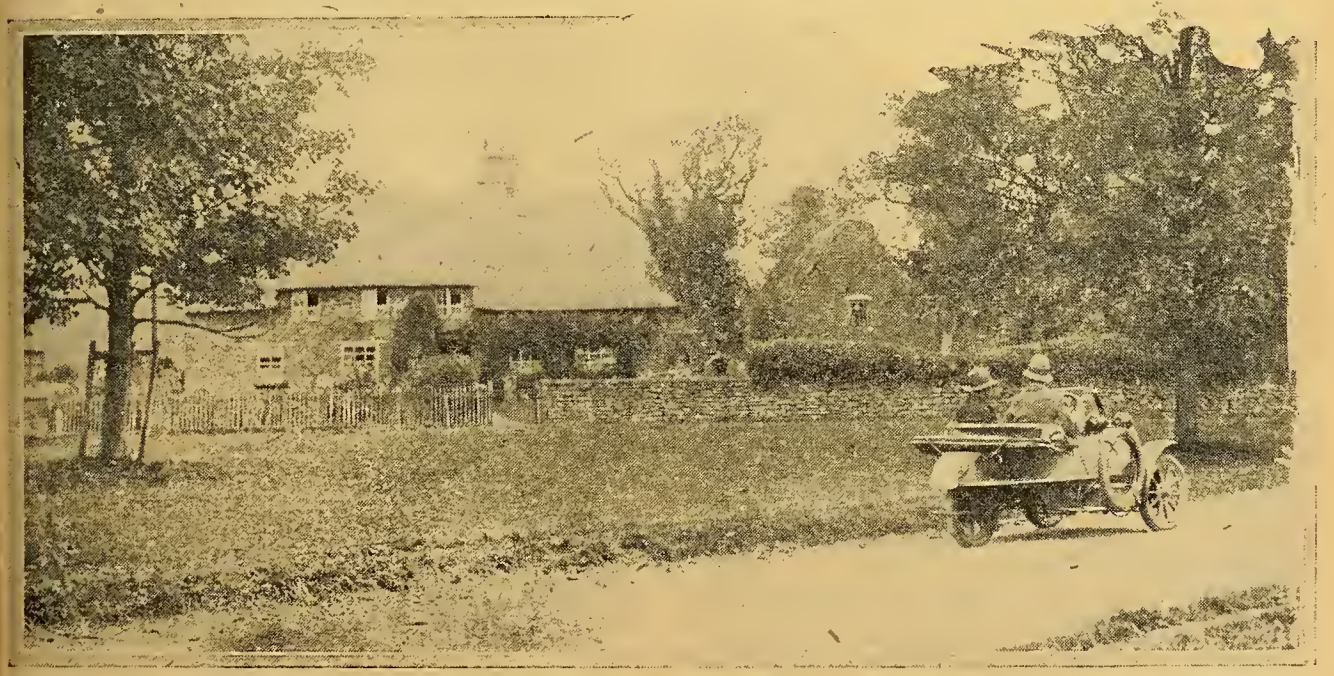
AMONG the stands to which you devote real attention, be sure not to miss 51. It is inhabited by certain varlets of the T.O.M. crowd. They aren't able to show you the nicest things they produce, because tents occupy the dickens of a lot of room, and you must go to 61, Newman Street to inspect their very charming cheap touring outfits. But at Olympia you will find them displaying the latest thing in windscreens for parrots. (A "parrot" is any motor cyclist who occupies a saddle.) I have now tried three outfits of this type, so designers seem to be discovering that 20° of frost plus an east wind are common in these islands. The new Easting is a celluloid handlebar screen with a knee apron. The B.S.A. is a huge metal field-gun screen. The T.O.M. gadget breaks new ground. Its lower storeys consist of metal legshields, enamelled in your tank colours, and embodying air chutes to cool the engine. Above that comes a waterproof twill chest protector, chin-high; and right on top is a dinky little face protector of Triplex glass. The whole affair is rigid; detachable in a matter of one minute; adjustable all ways for height and nearness and folds back to cover the machine.

Some Astounding Claims.

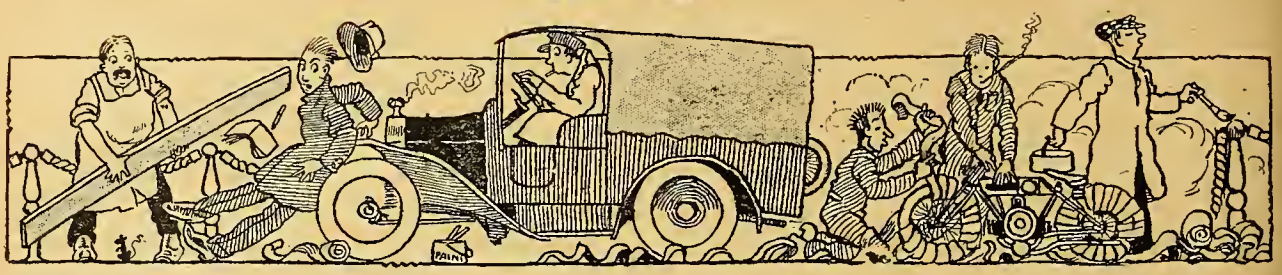
I THINK there is no doubt that these windscreens for parrots are going to get universal on big outfits in the bad months. But I am specially interested in certain purely technical claims which I have not heard advanced till I chatted with the T.O.M. experts. They claim that a first-class fitting of the kind actually adds to your speed, and reduces your gallonages. They are modest people, and do not as yet dogmatise as to the exact causation of these miracles. I call them miracles, because any No. 5 hat would opine offhand that, if you have to push a young sail through the air, speed will drop and gallonages mount. This, as the result of careful tests, the T.O.M. men deny. They suggest that either their air-chutes put so much cold air just where it is wanted that your cylinder keeps rounder than it does on a naked 'bus. Or, alternatively, the wind resistance caused by a screen with a horizontal section resembling a V which has been stepped on perpendicularly, is less than the resistance of such an irregular polyhedron as "Ixion" forms when clad in his storm suitings. Anyhow, a T.O.M. shield is being installed on my Ricumph.

Loud Cheers.

I HEREBY draw the attention of all owners of gas lamps to the announcement made on page 654 of our issue dated November 9th last, and no less to the contents of Stand No. 240 at Olympia. For the first time a dissolved acetylene outfit is being marketed which will fit the rear prongs of a double lamp-bracket. True, it only holds 4-5 cubic feet of gas, sufficient for seven or eight hours' light; but, as I told its sponsors years ago, lots of riders use accumulator sets which, unless maintained by a dynamo, are never equal to more than eight hours' riding. The one and only snag about the new A.L. outfit is that it does not include a gauge. This means that sooner or later a rider will start on a thirty-mile run, and will not be quite sure whether he has enough gas remaining in his cylinder. For such imbroglios there are two remedies. The rider who lives at the back of beyond must buy two cylinders. The rider who resides in a civilised county must be able to rely on finding spare cylinders at every garage.



IN THE HEART OF ENGLAND. An L.S.D. three-wheeler passing through Meriden, one of the many quaint and picturesque villages of Warwickshire, a county rich in historic associations.



BEFORE THE SHOW.

Impressions of Olympia as it is Before the Doors are Opened to the Public.

THOSE who see the well-ordered stands and glittering series of machines for the first time when the Show is opened to the public little realise what the scene was like a few days beforehand. To achieve that orderly neatness takes infinite pains and trouble, for, humans being human, the models that were to have been ready days previously, as per schedule, are often finished actually on the stands.

Olympia shorn of its myriad lights, its carpets and its ornament, loses all glamour and becomes the cold and draughty, forbidding and ugly building that it is. The stands are there, if more or less rectangular wooden bases may be termed stands, and the name boards are in position, having been dug out recently from a cupboard the dust from which they still bear.

Every doorway is open to a penetrating blast sent by Boreas especially for the occasion, so that strong men, of proved endurance at Brooklands, wrap themselves in many overcoats and turn a sickly purple.

A Mystic Chorus.

Down the concrete-floored gangways pant and heave burly labourers propelling huge crates in which are motor cycles, their every action taken to the mystic chorus of their craft, "to me," "from you," "all together 'eave." The object of the game they play with stubborn seriousness is to place the crate on a stand furthest from that for which it is destined. If this is done and the real recipient is seen telephoning frantically for news of the consignment, then it counts game and set, and the gang trot off to the "Fox and Hounds." More skilful players bring a horse and dray, which is better, because, with careful driving, the rear wheels can crunch over one's opponents' stands, but best of all is the Ford van, which somehow or other gets in despite regulations, and, once in, can cause more excitement than anything else. How the things get to the gallery is a riddle no man can solve.

Imagine, therefore, many men bringing crates in clouds of choking concrete dust, others dismantling crates, and others covering every available inch of space with yards and yards of the wrapping in which motor cycles are swathed. Indeed, a motor cycle on arriving at the Show resembles nothing so much as that type of recruit whose puttees at once suggested elephantiasis to an observant medico. This wrapping comes off in long strips, the strips litter the stands, entangle the legs of passers-by, and coil round electric light contacts, for, remember, all this time stolid electricians are wiring innumerable connections for the display lamps, or making heart-breaking attempts to revive dumb telephones. To a man precariously swinging on the signboard of a stand festooned with electric bulbs, what is one bulb more or less, but to the harassed pedestrian on the floor below the receipt of a fallen bulb as a direct hit is apt to irritate.

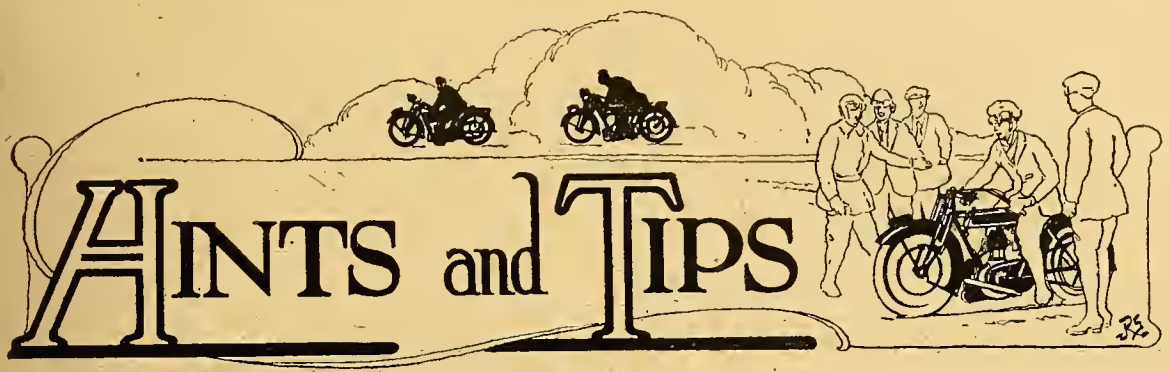
Energetic Supers.

Over all this scene brood the carpenters, and you know what a carpenter armed with a Brussels carpet bagful of tools can do. If there be confusion then he at once starts nailing down something with clangorous hammer blows which split the ear-drums. If there is no confusion, then he makes some. Other folk, many other folk, are about, some unrolling hundreds of yards of matting, some washing down stands—these generally charladies of peculiar and insistent pattern—some laying carpets, and some polishing machines.

Then there is the painter whose task it is to whiten all those jolly little posts which decorate and demark the stands, especially those one leans against.

Those intent on getting details of an exhibit, therefore, must first find the harassed individual in charge of the stand, then write of what they can see through the bars of a crate, and all the while dodge vans and carpet rolls, and carpenters, and falling bulbs, as to the manner born.

Years ago a solemn little procession of staid and sober men, each attired in the clothes of convention and the top hat of ceremony, processed solemnly round the Show to declare it open. Between the paint their clothes collected, and the nailed boards they fell over, between dodging packing-cases and avoiding horses with wicked eyes and ears, the procession lost much of its dignity in the first lap, and gradually became, in Navy language, obsolescent.



HINTS and TIPS

Jottings for the Beginner. Some Technical Terms and Abbreviations Explained. The Question of Power.

It has always been one of the chief aims of "The Motor Cycle" to assist the novice, and every issue since No. 1 appeared, twenty years ago, has contained authoritative and helpful articles so written that the most technical subjects are readily understood.

The following notes are intended exclusively for the beginner and are compiled in order to explain many points which at first may mystify the tyro. Even experienced motor cyclists are constantly exchanging "hints and tips," from which fact the novice must not, however, assume that the motor cycle as a vehicle is so complicated that it is necessary to acquire a technical and practical knowledge of motor mechanics before ownership may become a pleasure.

TECHNICAL TERMS AND ABBREVIATIONS.

ONE of the things which greatly mystify the man or woman when first perusing a motoring journal is the collection of technical abbreviations which every motor cyclist understands and accepts as part of the English language. We need not here mention all these contractions; it suffices to explain the meaning of those which may be encountered in reading this issue of *The Motor Cycle*. Chief among the common abbreviations, perhaps, is the term c.c. This means cubic centimetres (not cubical capacity which is quite a popular error). The capacity of an engine cylinder is measured in cubic centimetres for the reason that the bore (diameter of cylinder) and stroke (travel of piston) are measured by metric units. Naturally the capacity of an engine will denote its approximate power—in fact, it has been the rule to accept 100 c.c. as representing one horse-power.

HORSE-POWER (H.P.).

THE term "horse-power" is familiar to everyone, but is somewhat a misnomer, and although the manufacturers are, for the present, retaining the symbol h.p. (horse-power) to differentiate between the different sizes of engines used, *The Motor Cycle*, for some time past, has classified machines by means of capacity in cubic centimetres only. We recommend that the novice follows the same practice for the reason that the horse-power figures quoted in makers' catalogues have no standard basis. They are merely nominal figures—the result of habit rather than a definite power rating or even an estimation of the power theoretically possible. For example, many machines are quoted as being $3\frac{1}{2}$ h.p., yet their cubical capacities vary between 350 c.c. and 500 c.c. Again, one well-known motor cycle has an engine of 557 c.c., and is known as a $4\frac{1}{4}$ h.p., and another of 663 c.c. is quoted as being 4 h.p. only. From these facts the beginner will see that the horse-power of a machine may be anything which the makers care to state in their catalogues, but every manufacturer also gives the bore and stroke (in millimetres) and the cubic capacity (in cubic centimetres), and from these figures it is an easy matter to judge the respective powers of engines of different makes.

How to Differentiate between the various Sizes of Engines. Types of Motor Cycles for the Novice.

M.P.H. AND M.P.G.

TWO abbreviations freely used in classifying the capabilities of motor cycles are m.p.h. and m.p.g. They represent a measure of the machine's performance in relation to time and fuel used, and both are self-explanatory. M.p.h. is a contraction of miles per hour and m.p.g. of miles per gallon.

When a machine is claimed to be capable of a speed of 60 m.p.h. it does not necessarily mean that 60 miles could be covered in the hour, but more likely the claim is that for a short distance, perhaps half-a-mile or one kilometre, it will attain the mile-a-minute pace after a suitable "flying start" in which to accelerate to its maximum speed.

The ordinary motor cyclist is more affected by consumption (m.p.g.) figures. Good consumption, by which is meant *low* consumption, is a term synonymous with economy. A machine guaranteed to run 100 m.p.g. will consume one gallon of fuel in running over 100 miles of level or average "give and take" roads. In a particularly steep or rough district the consumption would be higher, but m.p.g. must of necessity refer to the average number of miles run to the gallon of fuel under average conditions.

MOTOR CYCLES CLASSIFIED.

ANYONE for the first time studying the specifications of motor cycles, either from a collection of catalogues or from the report of the Show contained in this issue, will observe that the majority of engines have capacities just under 250 c.c., 350 c.c., 500 c.c., 750 c.c., and 1,000 c.c. This is brought about by the Auto Cycle Union and international classification of motor cycles by their engine

Hints and Tips.—

capacity. For example, the great Tourist Trophy races are for machines not exceeding (1) 250 c.c., termed lightweights; (2) 350 c.c., or junior machines; and (3) 500 c.c., or senior machines. Five hundred c.c. is the largest capacity allowed in the Tourist Trophy races, but at Brooklands, where British and International records are made, competitions for 750 c.c. and 1,000 c.c. machines are also included, while in the reliability trials which are so popular, the whole range is included. There are other engines which do not appear to belong to any of the classes mentioned above. These, however, are usually under 200 c.c. as fitted in the ultra lightweights, for which the Auto Cycle Union has not inaugurated a special class, and single-cylinder motor cycles between 500 c.c. and 700 c.c., which have engines of the 500 c.c. type but slightly enlarged in order to give the extra power desirable when a sidecar is attached. There is, however, a class for sidecars up to 600 c.c in the record and racing regulations.

IN choosing a motor cycle, the first thing to decide is whether it is to be used (1) always solo, (2) occasionally solo and occasionally with sidecar, or (3) always with sidecar attached. If solo only, there is a promising choice amongst machines having an engine capacity ranging from 250 c.c. to 500 c.c. We will leave out of consideration for the moment the machines having an engine capacity of less than 200 c.c., and deal later with this size, for it is undoubtedly a type which will develop amazingly as time goes on.

SOLO OR SIDECAR?

NEXT, the prospective purchaser should make up his mind as to whether he desires a touring or a sports type of mount. He should bear in mind the fact that, although he will obtain a more speedy machine if he decides on the sports type, he will necessarily have to humour it more by careful driving and more frequent tuning. The difference between a sports and a touring model usually lies in a faster but a more sensitive engine, which requires a certain amount of skill to drive. Again, sports models often have overhead valve engines, and a broken valve can sometimes be caused by bad driving, with results which are infinitely more serious than in the case of a side-by-side valve engine.

SPORTS OR TOURING?

THE machine with the smallest engine for really serious touring is the 250 c.c. type which generally weighs between 150 and 200 lb. If fitted with a three-speed gear it will be capable of climbing the steepest hills, provided it be kept in reasonably good tune. It should average something like 120 m.p.g. if fitted with a four-stroke engine, and slightly less if the power unit be of the two-stroke variety. A touring model of this capacity should be capable of averaging 20-22 m.p.h. on give-and-take main roads in the hands of non-expert riders. Its maximum road speed should be about 38 m.p.h., while taxation will be £1 10s. per annum.

250 c.c. MACHINES.

PROBABLY the most popular solo model during the coming year will be the 350 c.c. type, although several machines of this class weigh more than 200 lb. (£1 10s. tax limit). The more efficient specimens will do nearly all that the old 500 c.c. machine used to do in pre-war days (it is, perhaps, in top gear acceleration only that there is any falling short), and they should be equal to averaging 25 m.p.h. under normal conditions. The maximum speed of a touring model should be about 45 m.p.h.—of a sports model, possibly 60 m.p.h. Petrol consumption is around 90-100 m.p.g.

THE 350 c.c. TYPE.

A LARGE section of the motor cycle community —those who like to lose as little time as possible on the road—will always look with favour upon the old and trusted 500 c.c. type. Even if it be not kept in the pink of condition, the 500 c.c. solo mount will be equal to almost any hill, and can be loaded with lots of kit and a heavy rider without complaining. Numerous makers are producing "light tourist" 500 c.c. machines which are much more suitable for solo riding than were the somewhat cumbersome specimens of a couple of years ago. Such a machine is as fast as is practicable for the average British road. In the touring models the maximum speed is around 55 m.p.h., while sports types may be capable of anything up to 75 m.p.h. Petrol consumption is between 85 and 100 m.p.g.

500 c.c. MOTOR CYCLES.

THERE are some riders who like to have unlimited power at their disposal, but, generally speaking, it is not of great advantage to have an engine of greater capacity than 500 c.c. for purely solo purposes, since maximum speed and practicable average speed are little, if any, greater. Comfort, however, is usually greater.

ABOVE 500 c.c.

FOR passenger use the 350 c.c. motor cycle is capable of pulling a light attachment with a not-too-bulky passenger over most roads. If the machine be thus laden, however, it is as well to bear in mind that it will need a fair amount of keeping in tune, because it will necessarily be driven most of the time at its full power. For short journeys over reasonably level roads, it is possible to average about 20 m.p.h., but petrol consumption will not be remarkably low, due to the frequent need for "full throttle," in other words, giving the engine all the gas it will take.

SOLO-CUM-SIDECAR MACHINES.

THE great popularity of the big single cylinder machine is largely due to its being suitable equally for solo or for serious sidecar work. A few years ago many manufacturers of 500 c.c. machines increased the capacity of their engines by anything up to 150 c.c. in order to render them more suitable for passenger work, and it is a fact that the single-cylinder engine of 550-650 c.c. is capable of hauling a fairly roomy sidecar, with passen-

THE "BIG SINGLE."

Hints and Tips.—

ger and luggage, over practically any road at an average speed of from 24 to 26 m.p.h., with a maximum of about 42 m.p.h., and a petrol consumption in the neighbourhood of 70 m.p.g. This type of machine is generally considered to be the most useful dual-purpose mount.

BECAUSE a twin-cylinder engine is a smoother running power unit than a big single, the 750 c.c. twin-machine has many adherents. It is usually somewhat heavier, and longer in the wheelbase, than the previous type dealt with, and it is, therefore, more frequently regarded as a purely sidecar mount. As such, it is capable of about the same road performance as the big single, although the maximum speed and hill-climbing ability may be a trifle better. With a sidecar it will average about 60-65 m.p.g. and is capable of a maximum speed round about 45 m.p.h. Certain "light" machines of this category make ideal solo mounts.

TWIN-CYLINDER MOTOR CYCLES.

THERE are a number of machines of 750 c.c. which are intended by their manufacturers solely for sidecar work, and are sometimes, in fact, listed as outfits only. Usually these motor cycles are heavily built, and would not be quite ideal for solo riding. Discretion is necessary in the choice of a motor cycle of this class if it is to be used for the dual purpose of solo and sidecar machine.

SOLELY FOR PASSENGER WORK.

THE 1,000 c.c. motor cycle for sidecar work has certainly increased its popularity of late years, although there has been a tendency towards smaller engine sizes in the solo classes. The big twin outfit is seldom driven at its maximum power, and therefore has a good reserve when a hill is encountered. On this account the 1,000 c.c. sidecar is preferred by a not inconsiderable proportion of road users to the more sluggish light car. A 28 m.p.h. average is well within the bounds of possibility, although petrol consumption is apt to be somewhat heavy if high average speeds are indulged in. Maximum speed, unless the engine be of the super-sports type geared fairly high and pulling a sidecar to match, will probably not exceed 48 m.p.h. Reasonable driving will usually result in a petrol consumption of about 44-55 m.p.g. even if an automatic carburetter is used or if the semi-automatic is adjusted to give one lever control.

THE BIG TWIN.

THE TREND TOWARDS SIMPLICITY.

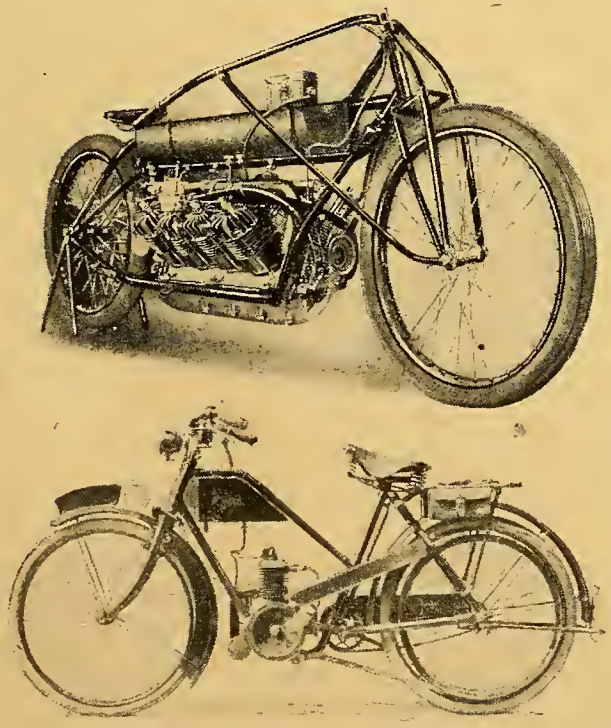
Current and Future Motor Cycle Design based on the Elimination of the Unessential.

IT has become a habit of critics of the motor cycle to assert that there is a tendency towards over-development. If this were true two or three years back, it certainly is not so to-day.

A decade ago there were several motor cycles which were infinitely more complicated than the most mechanically elaborate machine of the present time. To-day every other manufacturer of motor cycles is adding a lightweight to his range of models.

Then there is the present-day miniature two-stroke machine, which is a development of the auxiliary-engined bicycle. This type is becoming very popular, and will no doubt bring a large number of riders into the motor cycling fraternity.

It may be argued that ten or more years ago similar machines were offered to the public and were tried and found wanting. Those who rode the motorised bicycle of that period know that its life was comparatively short. Its engine was usually of the four-stroke type, and the valve gear was so delicate in construction that it could not stand the loads put upon it by the high speeds demanded.



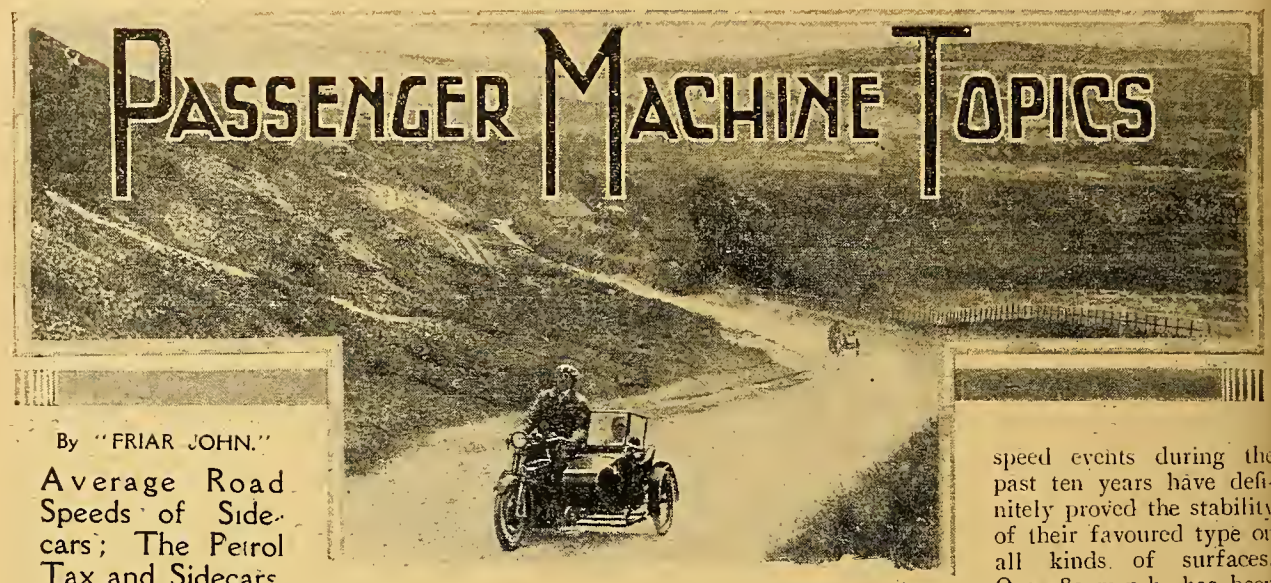
A CONTRAST. At present the motorised bicycle represents the limit of simplicity in Great Britain's self-propelled motor vehicles. The top illustration depicts a nominally 40 h.p. eight-cylinder Curtiss used in America nearly twenty years ago.

The present-day diminutive two-stroke is a thoroughly practicable proposition. It has only three moving parts against the dozen or more in the old type miniature four-stroke.

Ten years ago there were several motor cycles fitted with four-cylinder engines, but to-day not one is produced in this country. There were also many water-cooled engines; at the present time there is only one.

Simplicity is the keynote of present-day design; a few years back all kinds of weird machines were produced, but, in my opinion, motor cyclists have shown that they favour the simple economical mount rather than the machine which requires a great deal of time to keep in tune. Anyone with average intelligence can manage the modern machine. VEDETTE.

PASSENGER MACHINE TOPICS



By "FRIAR JOHN."

Average Road Speeds of Sidecars; The Petrol Tax and Sidecars.

THIS year has been marked by the introduction of several "solid" hoods of the type that, when not in use, may be instantly swung beneath the rear portion of the sidecar body. I should have thought more proprietary sidecar manufacturers would have adopted the idea for use on sporting sidecars, for even owners of 60 m.p.h. outfits have some consideration for their passengers.

THE question of average road speeds often crops up in connection with solo riders. What of sidecar speeds? I imagine few sidecarists have a better record than the chief of *The Motor Cycle* Press photographers. His mileage this year is 10,000 miles, and in that distance he has had three involuntary stops. Many of us boast of fast runs along the Great North Road, but his record of journeying from London to Edinburgh at an average speed of 28 m.p.h., then covering the 1,000 miles of very nice, picturesque course selected by the sporting boys of the Edinburgh M.C.C. for the Scottish "Six Days," and afterwards another fast run back to London, is no small achievement. This "little" tour accomplished, there was at last rest and repose for the machine and man. But such strenuous use demands a vehicle more reliable than a locomotive, for no steam engine would have been permitted to cover this mileage without an overhaul. Another ride of his from Patterdale to London (300 miles) between 5 o'clock in the afternoon and 5 o'clock the next morning is worth mentioning. So it will be gathered that photographs of the big trials are not obtained without arduous riding.

IS the sidecar more stable on greasy roads than the three-wheeler? Last week's correspondence on the subject of the three-wheeler in the I.O.M. raises a more vital question than even the admittance of that type of machine into the Sidecar T.T. Exponents of the Morgan class of vehicle may conceivably dismiss such a question as being one about which it is too ridiculous to argue. They will contend that trials and speed events during the past ten years have definitely proved the stability of their favoured type on all kinds of surfaces. Over 80 m.p.h. has been attained on a J.A.P.-engined Morgan at Brooklands, and a similar machine has won a Grand Prix. These successes should be sufficient to confirm their assertion. The I.O.M. course is a very different proposition from Brooklands, and, compared with the Grand Prix circuit, the Manx course contains many more danger spots.

QUITE apart from the policy of pitting sidecars against three-wheelers, this question of "tail wagging" is interesting. I believe Mr. Morgan himself would be the last to assert that Morgans don't "wag" on grease. I have driven the De Luxe model several thousands of miles, and have never been in danger through skidding, although the slight side-slipping of the rear wheel was disconcerting at first. On the other hand, with a sidecar I one day skidded from one side of the road to the other. This proves nothing, however. Contrary to Mr. W. A. Carr, who said in last week's issue of *The Motor Cycle* he would rather be the passenger in a three-wheeler than in a sidecar during a T.T. race, I would sooner be the passenger in a sidecar, especially on a wet day.

MR. D. R. O'DONOVAN states that the I.O.M. course is too narrow for racing three-wheelers in safety, but the majority of three-wheeler exponents give flat contradiction to his statement. Personally I would like to see three-wheelers compete, which would mean, of course, the inclusion of 1,000 c.c. sidecars. There again opinion is very divided.

SIDECAR owners will probably feel the advantage of a reversion to the petrol tax more than any class of motorist. We all anxiously await the effect of the memorandum recently presented to the Ministry of Transport, which pointed out all the benefits to be gained by a petrol tax. The general feeling is that in 1924 we may be motoring under a taxation less iniquitous, or perhaps one ought to say more equitable, than is the case at present.

What The Show Reveals

Development of the Smaller Solo Machine. British Solo Big Twins Meet All Competition. Value in Medium and Full Powered Sidecar Outfits.

In addition to forming a convenient record of development which has taken place during 1922, the accompanying article will assist the potential purchaser of a motor cycle whether he visits Olympia or not.

IN the estimation of those who have made the motor cycle movement a subject for close study, two outstanding facts are associated with the present Show.

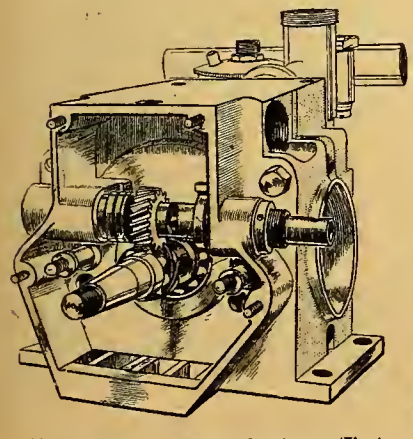
Both of them, curiously enough, have to do with the smaller solo type of machine, for it is at this end of the scale that the most outstanding developments have been made. These facts, which are so evident, are the rapid growth of interest in the miniature-engined, ultra-lightweight motor cycle, and the concentration of designing ability on the part of some of the most prominent manufacturers in the industry upon the 350 c.c. four-stroke type of machine produced throughout in the parent factory.

It is not difficult to trace back these stirrings in the general current of progress. In the case of the ultra-lightweight, the popularity of one example of the modernised motorised bicycle, introduced last year, attracted the attention of many smaller makers seeking outlet for their productive energies, while the signal success of the 350 c.c. four-stroke single in 1921 has now shown its deep influence on the older manufacturers of bigger-engined models hitherto regarded as essential for hard solo work.

The rise of the 350 c.c. four-stroke single was indicated at the last Show; its forward movement is now confirmed.

In a corresponding article published in the early stages of the 1921 Show, we prophesied that the big American twin would have to look to its laurels in the year 1922, and in this we have been justified by the recent records established by Le Vack and by the results of many speed events on road and track.

The big twin solo machine of British manufac-



Timing case cover of the latest Wooler removed to show camshaft drive.

Engine of 347 c.c. Martinsyde, with silent overhead exhaust valve mechanism.

ture has sprung into prominence in a remarkable manner during the past twelve months, and, though some of the pioneers deserve much credit, the movement has undoubtedly been helped forward by the newcomers who have designed machines essentially to suit the sporting rider.

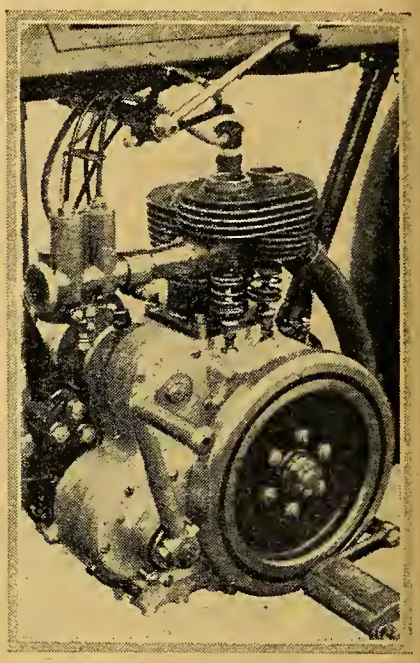
Of course, all these big twin solo machines are suitable for sidecar work to some degree, but the majority are designed primarily for the one duty.

At the other end of the list we welcome the advent of the really light motor cycles which have already been mentioned. Although such machines have made spasmodic appearances throughout the history of the motor cycle, the progress of engineering has now brought us to the point where the miniature engine of approximately 150 c.c. is no longer a toy but a powerful and reliable power plant.

Future of the Ultra-Lightweight.

In this development is to be seen the foundation of the motor cycle of the future, which in a later stage, when it has become more weatherproof, will form a means of transport for thousands of workers who prefer (or are forced by circumstances) to live some distance from their places of business.

Already the manufacturers who have turned to miniature motor cycles make a formidable list, and the backing of so many firms forms a guarantee of the faith of the industry in this type.



Engine and three-speed gear unit of the new 346 c.c. Triumph.

The 250 c.c. Class.

An increase of 100 c.c. brings us to a class which, although it has a promising future, has made but little progress in point of numbers this year. Nevertheless, it is an open secret that one of the most prominent makers is experimenting with units of this size, and another will actually stage a machine of this capacity.

Progress in design, in the 250 c.c. class, has undoubtedly taken place during this year, as witness the speed performances achieved in the T.T. and the Belgian and French Grand Prix races.

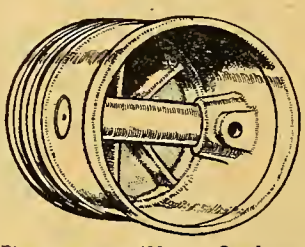
Fine example of flat-twin design, the 600 c.c. Humber. One of the detachable valve pockets is shown removed.

What the Show Reveals.—

A new side-by-side valve 250 c.c. proprietary unit makes its appearance for the first time, and its advent has increased the ranks of 250 c.c. machines by at least one honoured name.

In the 350 c.c. class is found the most popular type in point of numbers. Thirty-seven makes show it, seventeen of whom produce their own special engine. Proprietary engines of both two- and four-stroke type are available, and amongst the latter are side-valve, overhead-valve, sleeve-valve, and oil-cooled units.



Piston on new 490 c.c. Quadrant, with ribbed head.

350 c.c. Popularity.

Perhaps the most convincing and definite indication of the trend of design lies in the fact that the majority of the oldest established manufacturers in the trade have decided to market machines of the popular 350 c.c. size.

As usual, the evergreen 500 c.c. machine continues to do more than hold its head above water. So often has it been said that it is moribund that it is refreshing to find so many makes still flourishing and more makes joining the class.

When nine or ten firms with historic names, backed by almost every manufacturer of engines, pin their faith to the 500 c.c. type as their main solo model, one need not worry unduly about the future of the class, since it is hardly likely that the machines are produced for show purposes only.

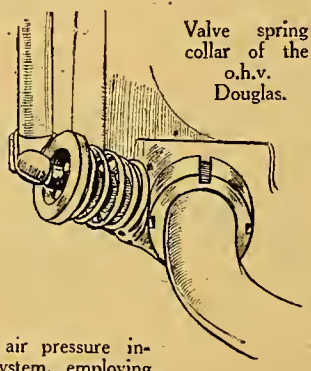
Amongst bigger "singles" one staunch adherent has been lost, but, nevertheless, this type remains perhaps the most popular form of machine for sidecar work.

Big and moderate-sized twin-cylinder sidecar outfits do not appear to be on the increase, nor, on the other hand, do they show any signs of fading away, and with the considerable price reductions which have been made they stand in no fear of competition from any quarter.

Three-wheelers.

Except for a general reduction in prices there does not appear to be any outstanding change in the position of three-wheeled vehicles. All the old-established makers stage attractive exhibits, and while one machine shown last year has now developed a fourth wheel and left the fold, a solo runabout on three wheels has now extended its range to a two-seater model.

There is undoubtedly a place for the three-wheeler in the general scheme of things both as an inexpensive method of conveying two persons with full weather protection and as a means of providing a really high-class outfit at a price which compares favourably with cars of comparatively meagre specification.



Valve spring collar of the o.h.v. Douglas.

Amongst the three-wheelers are some of the cleverest and most practical designs on the market, and the public would do well to rid themselves of prejudice against either unusual appearance or construction.

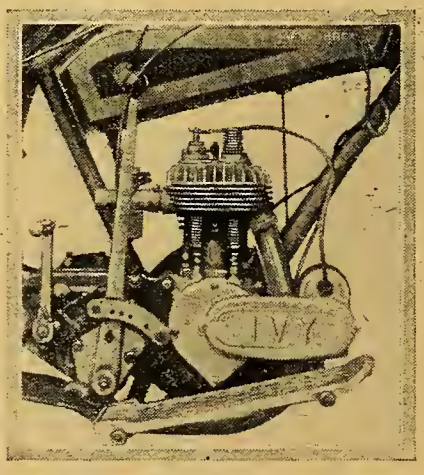
Valve rocker arrangement on the sporting Wooler engine.



349 c.c. four-stroke Ivy engine, the product of a firm of two-stroke specialists.

Sidecars.

No symptoms of failing are visible in the sidecar world, and the passenger attachment is becoming more and more practical. There are still luxuriously appointed and superbly sprung sidecars to be found, but the tendency towards over-development, which at one time showed signs of increasing, appears to have received a check, and the more useful, though not less ornamental body, is gaining ground. The Americans show a tendency to still further increase engine size for sidecar work; two 1,200 c.c. models are shown.

We have with us all our old friends in the sidecar world whose names are sufficient guarantee of the goods they produce, and, in addition, there are newcomers. It is unfortunate that the announcement of a sidecar T.T. race came so late in the present year, as it will undoubtedly have much bearing on sidecar chassis design; changes made with this or similar races in view are not likely to be made for some little time.

Detail Design.

Having reviewed the general trend of design, some particular and technical details may now be discussed. In the case of engine units, for example, four-strokes are still in the majority, though the two-stroke is holding its own. In one case a firm of two-stroke specialists has introduced a four-stroke model of considerable interest, but none of the previous models are being abandoned. Such new two-strokes as have appeared come chiefly into the smaller categories.

There has been a decided tendency to increase engine capacity in

AT OLYMPIA.

Machines and Details of Interest.

Re-designed forks on the Cedos lightweight, which damp out shock and rebound.

the two-stroke class up to about 350 c.c., but it is curious that the marked success of one make of air-cooled two-stroke in the 500 c.c. category has not attracted followers.

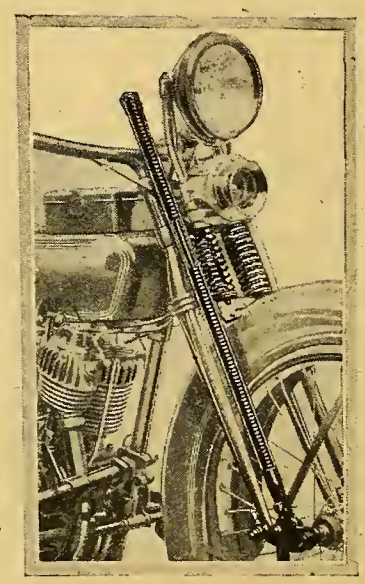
Taking engine design as a whole, there are few really striking departures. Overhead and side-by-side valve gears maintain much about the same proportions as before, and in many cases are offered as alternatives by the same manufacturers.

Mechanical lubrication has been extended by some notable additions embodied in makers' own engines, and also by the improvement of existing and the introduction of new proprietary engine-driven oil pumps.

Apart from engine lubrication there is a tendency to fit better lubricators, or even grease cups on the cycle parts, and one or two makers employ grease gun lubrication by special nipples throughout.

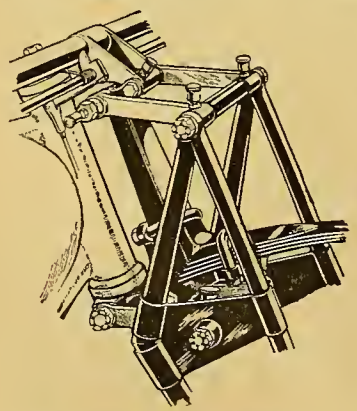
Unit Construction.

Unit construction of engine and gear box is undoubtedly gaining ground after many years of waiting. One of our most important makers shows a 350 c.c. model with a complete engine-gear unit and enclosed primary drive by gearing, and others are only slightly less advanced in that a chain is used between crankshaft and gearshaft.



Four auxiliary springs have been added to the Harley-Davidson front fork, which now has eight springs in all.

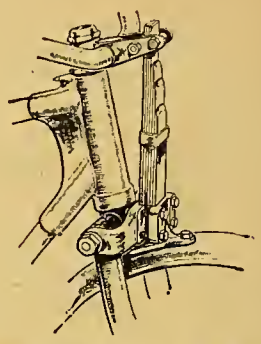
British makers may even be spurred by the sight of a most highly developed example of Italian design in which the first step of the drive is by enclosed spiral pinions.



Link construction on the spring fork of the 1923 Beardmore-Precision sports model.

Apart from complete engine-gear units, several makers adopt the unit assembly system whereby engine and gear box are secured to common plates and mounted in the frame as a single unit; this method has much to commend it, as heavy dismantling costs are avoided if only one of the components becomes deranged.

Speed gear construction shows marked development, and almost all the proprietary gear box makers have produced new boxes and improved their existing models; there are other interesting transmission features to be noted. For instance, two machines employing selective two-speed chain drives hitherto, now offer three speeds and four speeds respectively. Indeed, four makers in all will offer four-speed models apart from those who use the proprietary four-speed gear boxes which are available. There are also rumours of the advent of more gears of the latter class in the near future.

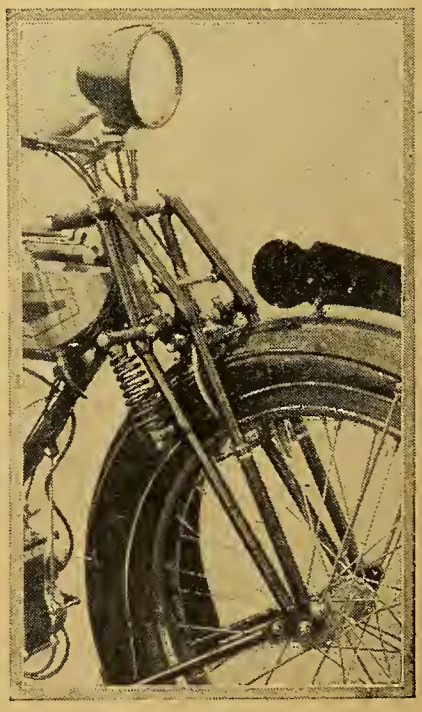


Simple hinged fork and leaf spring on the Omega miniature.

Shaft Transmission.

Shaft drive, after being represented by a single Belgian make for so many years (excepting a scooter), at last will have one British representative. In other respects the remarkable feature of transmission at the Show is the virtual disappearance of the belt on all but the lightest machines; chain-drive has indeed come into its own, although not, it must be regretted, in an all-enclosed form.

Another important advance lies in the fact that



New Druid-pattern Triumph forks fitted to the 550 c.c. (chain-driven) and 346 c.c. models.

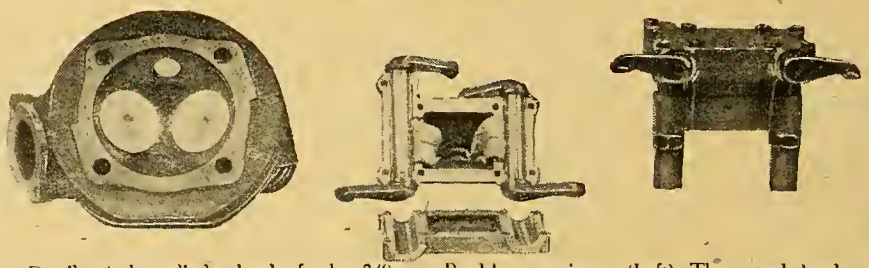
Brake and chain adjustment of the 976 c.c. New Imperial.

still another gear box manufacturer has incorporated a transmission shock absorber in the clutch mechanism, thus removing a load of responsibility from the engine maker and the motor cycle assembler, although some fit a cushion hub as well.



Details of the cylinder head of the 349 c.c. Bradshaw engine. (Left) The actual head showing the large diameter valves; (middle) the rocker box with wick-oiled bearings; and (right) the same item assembled.

Of transmission shock absorbers there are four main lines of development: that already mentioned, the spring link chain, the cushion type of hub, and the engine shaft shock absorber, usually of the spring-loaded cam type.

Variable pulley belt transmissions are almost non-existent, although some of the best examples are still obtainable on the cheaper editions of certain well-known makes. Friction drive, also, only has a very small following limited to light machines.

Brakework.

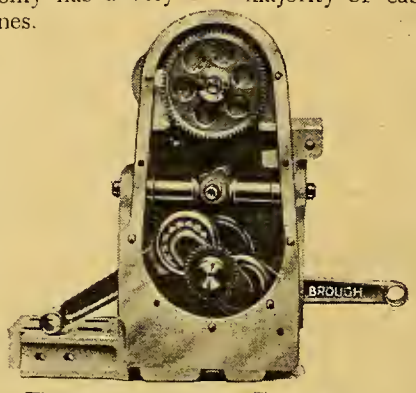
Far from being an unimportant detail, brakes are of vital importance, and have at last received the attention they deserve. Internal expanding brakes on at least one wheel have become very popular, and special means are usually provided when one is fitted to the rear for the removal of the wheel without disturbing brake or chain adjustments. The dummy belt rim brake finds many supporters, especially amongst machines of the highest class, for when properly designed it is most satisfactory. Band brakes are to be found on only a small number of machines.

Little change is visible in either frame or fork springing. All the big spring-frame machines remain with us, and there is one new spring frame amongst the lightweights. One very notable improvement has been made to spring forks, however, which consists of a damping device functioning in a manner similar to the friction type shock absorber so common in car practice. It is suitable for either front or rear suspension.

Broadly speaking, frames remain unaltered, but there are one or two good examples of duplex construction; in one case the "top" tubes run straight from the head to the rear spindle, and in several instances provision is made for enclosing engine and gears in a kind of bonnet, so that the rider is kept clean and the draught is concentrated by means of scoops upon the engine where it is most needed.

Improvements for the Practical Rider.

Quite a number of makers are attaching saddles direct to the frame members, thus saving some weight and lowering the riding position, and there is a considerable move in the direction of adjustable handlebars, much ingenuity having been displayed along these lines. Wider mudguards are fitted in the majority of cases, and the rather flat section guard with no valances has come into fashion. This type, especially when ample wheel clearance is arranged, will please our overseas riders.

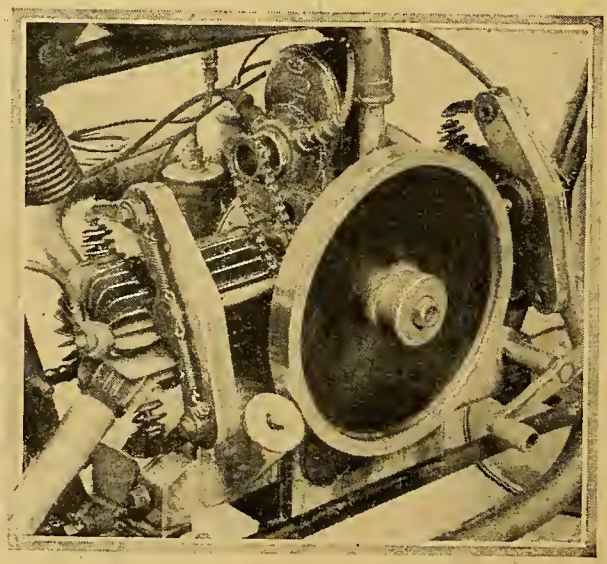


Timing case cover of 496 c.c. flat twin Brough engine removed to show roller-bearing big ends and camshaft.

Tanks which have given some trouble on modern high-speed machines have been stiffened in many cases. Some have a double partition between oil and petrol tank, and one or two have the two tanks made separately and divided by a felt packing piece.

A few firms have decided to drop the saddle tank on the score of structural weakness or expensive production, but it is retained by the majority of those who fitted it last year.

Two-lever carburetters continue to hold their own, and a new type of two-jet semi-automatic instrument has been fitted to several machines. Fully automatic single-lever carburetters are to be seen in fair numbers as standard equipment. There are, comparatively speaking, several newcomers which have made good headway.



"Semi-overhead" best describes the valve gear of the latest high efficiency Wooler engine.

Miniature Carburetters.

Two of the old-established carburetter makers have produced miniature apparatus to suit the tiny engines used on many of the modern ultra-light machines.

Magneto design continues to improve; departures from the accepted horse-shoe magnet type were made

What the Show Reveals.—

last year, and this year are still more common. In one instance a rotating magnet is employed, greatly simplifying the mechanical construction and wiring and relieving the armature of centrifugal stresses.

Tyres are cheaper and better this year, and a noticeable tendency to use bigger sections is apparent on all except the very lowest-priced models.

Controls do not appear to be simplified either by reduction in numbers or by standardisation as regards position, and the subject is worthy of further consideration. The new twist-grip control produced by a well-known carburetter firm will be welcomed by many.

This concludes the survey of what is revealed by a cursory glance over the exhibits at the Show, looking at them in their entirety rather than in detail.

Absence of freakishness, sound technical features, and practical fitments denoting a knowledge of the practical rider's requirements are features which augur well for the future. No one can visit the 1922 Olympia Show of motor cycles and come away with any feeling of pessimism as to the outlook of the sport and industry, on technical grounds at any rate.

MODERN DESIGN.

TYRES FOR 1923.

Importance of Substantial Covers. Sizes and Prices Tabulated.

SELECTION of the right tyre for its special duty is of the utmost importance. Tyres of insufficient weight or size can destroy the pleasure of many miles of motoring; it is essential, therefore, to obtain the best and biggest tyres that can be fitted to the rims of the machine.

In view of the apparently confusing array of tyre sizes given in the accompanying guide to the principal tyres for the 1923 market, it should be remembered that 26×2¼, 26×2⅜, and 26×2½ for 2¼ will fit on the same rim (and most probably on the 26×2 rims of many old machines and lightweights). Even 28×3 covers have been fitted to 26×2¼ rims, but the practice is not recommended by the tyre makers. On 650×65 rims the other sizes permissible are 700×80 and 710×85, and, in some cases, 26×3.

Rims of the old size (O.S.) 26×2½ may be fitted with a 26×3 oversize.

Questions and Replies

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 1½d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the top left-hand corner of the envelope, and should be kept distinct from questions bearing on technical subjects.

ROUTES.—By special arrangement with the Automobile Association and Motor Union, readers of "The Motor Cycle" desiring routes may enjoy the benefit of the Road Service Department of that organisation. Queries should be addressed to the Editor in the ordinary way (enclosing a 1½d. stamp), and will be dealt with by the A.A. and M.U., who are regularly in receipt of reports from their representatives all over the country as to the existing state of the roads in any particular locality.

VARIABLE PULLEY GEARING.

(1) When I wind down on to free engine on my single cylinder Zenith-Gradua the belt gets so tight that it stops the back wheel from going back as far as is necessary and I only just get free engine. Winding up on to top gear my belt is so slack that it allows the engine to race. If I tighten the belt on top gear, the belt then gets so tight as to stop me from getting free engine. I have tried adjusting the pulley from the engine shaft but all to no purpose. Can you please inform me what I can do? (2) Can I get a lower gear ratio than 6½ to 1 as I want to attach a sidecar?—P.H.G.

(1) If you cannot eliminate the trouble either by adjustment of the belt, the pulley flanges or the control rods it is likely that the flanges themselves are badly worn at the top and it would be better to renew them. (2) If you use a ¾in. belt you could probably get a 6¾ or 7 to 1 gear.

COASTING DOWN HILL.

(1) Is it a good plan to allow a motor cycle to run down hill with the engine shut off, chiefly for the sake of cooling the latter? (2) Supposing I coast in neutral will it damage the gears if I re-start the engine when the speed has decreased to about 10 m.p.h. by opening the throttle, lifting exhaust valve and engaging low gear, dropping the exhaust immediately? Is there a better way?—W.J.B.

(1) It is quite a good plan to close the throttle (leaving the air lever open) when coasting down hill, provided you leave the top gear engaged. (2) You are liable to damage something seriously if you adopt the method you suggest. If you wish to run freely down hill with the gears in the neutral position you must be prepared to re-start the engine at the bottom of the hill with the kick-starter, otherwise the shock on the gears and transmission, being suddenly called upon to overcome the resistance of the engine is likely to prove disastrous. It is possible, however, with practice on those machines which permit the gear lever being retained in the neutral position between top and middle to coast in this way. As the machine commences to slow down the clutch is withdrawn and timing the road speed carefully top gear is re-engaged and the clutch let in again with the exhaust valve raised and the throttle set for easy starting; the engine should start at once. This method, though feasible, is not to be recommended except to skilled and careful drivers as it increases unnecessarily the work of the clutch. It is quite usual to close the throttle and coast down against compression, lifting the exhaust lever occasionally to prevent an excess of oil being sucked up past the piston rings, which, of course, tends to oil up the sparking plug.

Important Dates.

Sat., Nov. 25th, to Sat., Dec. 2nd—Olympia Motor Cycle Show.

Tues., Dec. 26th, and Wed., Dec. 27th—M.C.C. London-Exeter Run.

Sat., Jan. 13th, to Wed., Jan. 24th (1923)—The Belgian Salon.

Fri., Jan. 26th, to Sat., Feb. 3rd (1923)—Scottish Motor Show.

SMALL CAR PROGRESS'ON

"THE AUTOCAR"—published from the offices of "THE MOTOR CYCLE" and conducted on the same enterprising lines—is the complete automobile journal embracing small, medium, and large cars. Every motor cyclist contemplating the purchase of a light car should read

The Autocar

Every Friday 4d.

Founded in 1895, "THE AUTOCAR" is the largest and most successful automobile paper and enjoys the greatest circulation. It is universally accepted as the representative British motoring journal.

BURNT VALVES.

Lately I have had trouble with exhaust valves pitting and burning on the face, but I cannot trace the cause. The tappets are adjusted properly and the mixture is right, as I have an adjustable jet. My machine is a 1920 998 c.c. Indian.—J. E. H.

If the tappets are correctly adjusted and the mixture is right the trouble may be caused by a slight error in the ignition timing. The contact breaker points should be just separating as the piston is on top dead centre with the magneto control two-thirds retarded. If the timing is in order, however, new exhaust valve springs may be necessary, as it is possible that the old ones have lost their temper. Make quite sure that the exhaust valve lifter is not preventing the valves seating correctly and also examine the cylinder seats, as the valves may be "pocketed" (*i.e.*, too deep in the seating as a result of frequent grinding in).

350 c.c. PERFORMANCE.

(1) What is the maximum speed of the average machine fitted with a 350 c.c. Blackburne engine without expert tuning? (2) Does it do the engine or machine any harm to drive it at its maximum over good roads? (3) What r.p.m. will the engine accelerate to? (4) I am thinking of raising the gear of this machine. Is this advisable, and if so to what should I raise it? (5) Is it harmful to the machine to take a friend on the carrier (16 st. weight total)? (6) What consumption should I get per gallon of oil and petrol?—H. W.

(1) From 40 to 45 m.p.h. (2) It is not advisable to drive a machine at its maximum speed for a very great distance, but where the roads are really good no serious harm could result from an occasional speed burst. (3) Probably the engine will do about 2,800-3,000 r.p.m. (4) You do not say what the present ratio is, but in any case we should not recommend you to raise it above 5 to 1 for solo riding or 5¼ to 1 if you are taking a passenger on the carrier. (5) No serious harm should result from carrying a passenger on the carrier. (6) About 90 to 100 m.p.g. petrol and 850 to 1,000 m.p.g. oil.

SPEED AND CONSUMPTION.

(1) What is the highest speed obtainable by a 269 c.c. Villiers-engined lightweight on the level? (2) The approximate petrol consumption, an Amac carburetter being fitted? (3) Is this engine suitable for strenuous touring in a fairly hilly district?—F.G.M.

(1) Approximately 40 m.p.h. under ordinary touring conditions. (2) Between 75 and 90 m.p.g. (3) Quite suitable.

BREAKAGE IN REPAIRERS' HANDS.

Recently I had occasion to send my 650 c.c. twin motor cycle to a garage for repairs, the flywheels being loose. After doing the job—retiming, etc.—and getting the machine in proper running order, and while still in their hands, for some reason or other the cylinder burst, consequently breaking the piston and connecting rod. (1) Having kept me waiting for several months, while new parts were secured, the garage proprietors are now including in their invoice the cost of these replacements. Do you consider I am liable? There could have been no flaw when they took the machine over, as this cylinder, etc., has been on the machine since it was new in 1918. (2) They had to dismantle and assemble the engine twice and perhaps spent a little time in fitting the piston; they charge time as 45 hours at 5s. per hour. Is the time spent excessive?—H.A.

(1) It would be very difficult to contest the charge for the replacement of the cylinder, as you would have considerable trouble in proving that the breakage was due to negligence on the part of the repairers, and it could be on this ground alone that you could claim to have it replaced. (2) In view of the fact that the breakage occurred while it was in the repairers' hands, the charge for refitting certainly appears to be high; in the majority of cases of this kind we find that a breakage is usually made good at approximately cost price; this applies especially to the best class of garage.

EXPERIENCES WANTED.

Readers' replies to questions published under this heading should be addressed c/o The Editor, "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4, when they will be forwarded direct to the querists concerned. Requests for experiences should be accompanied by a stamp.

"H.G." (Skelton-in-Cleveland).—Variable jets; Bowden extra air inlet; Hagg tandem: ease of steering.

"R.U." (Ecclefechan).—596 c.c. Indian Scout: stability on grease, performance of engine-countershaft gearing, electrical equipment.

"F.H.P." (Leicester).—Lucas electric Horn No. 52, used with Magdyno. Effect on plates of 8 a.h. accumulator.

"R.S." (Derby).—Coram pistons and rings in 1921 348 c.c. Douglas; necessity for "lapping" and care in running-in.

"L.J.G." (East Ham).—349 c.c. standard sports A.J.S.; 348 c.c. Douglas.

"F. and S.F." ((Fleetwood).—Junior Triumph: consumption, carbonisation, suitable oil, and timing.

"A.F." (Maidstone).—Family Morgan for three adults; leg room for rear passenger.

"S.L." (Birmingham).—Terry spring links on Druid forks (350 c.c. machine).

"E.H.C." (Liverpool). — Voltalite dynamo on motor cycle.

"R.F.B." (Portsmouth).—293 c.c. New Imperial or 349 c.c. Raleigh: long runs (150 miles); best transmission.

"W.G.R." (Stafford).—Binks three-jet on 349 c.c. Blackburne.

"G.E.M.J." (Ealing).—Indian Scout, solo and sidecar.

SPARKLETS.

Successes in 1922.

An illustrated booklet describing the wonderful successes of Sunbeam machines in the Senior T.T. Race and French, Italian, Austrian, and Belgian Grand Prix Races, as well as in the English Six Days Trials, will be sent to any reader on application to John Marston, Ltd., Sunbeamland, Wolverhampton.

A Successful Year.

The shareholders of Humber, Ltd., have cause to be satisfied with the trading of the company this year. In spite of the twelve weeks lock-out, adverse exchanges, and high duties, a 10 per cent. dividend has been declared on the ordinary shares. The net profit for the year amounted to £108,249.

Official Test of Folding Sidecar.

An A.C.U. test of the Dorway folding sidecar has been carried out. The body was removed, the chassis folded, re-opened, and the body replaced eight times in an average time of half-a-minute. The machine was then driven 100 miles by an A.C.U. official over the roughest roads in and about London, and the conclusions drawn were entirely satisfactory.

In the Cause of Charity.

In the Enfield Cycle Co.'s London depot, 48, Holborn Viaduct, London, E.C.1, is being exhibited a two-stroke model fitted with Maglita set which has been purchased by the past-president of the General East End Tradesmen's Association. It is being disposed of for the benefit of the London Hospital, Whitechapel. Tradesmen in the East End of London and in Smithfield Market are selling the necessary tickets at 2s. 6d. each. The ballot will be under the supervision of the Viscount Knutsford.

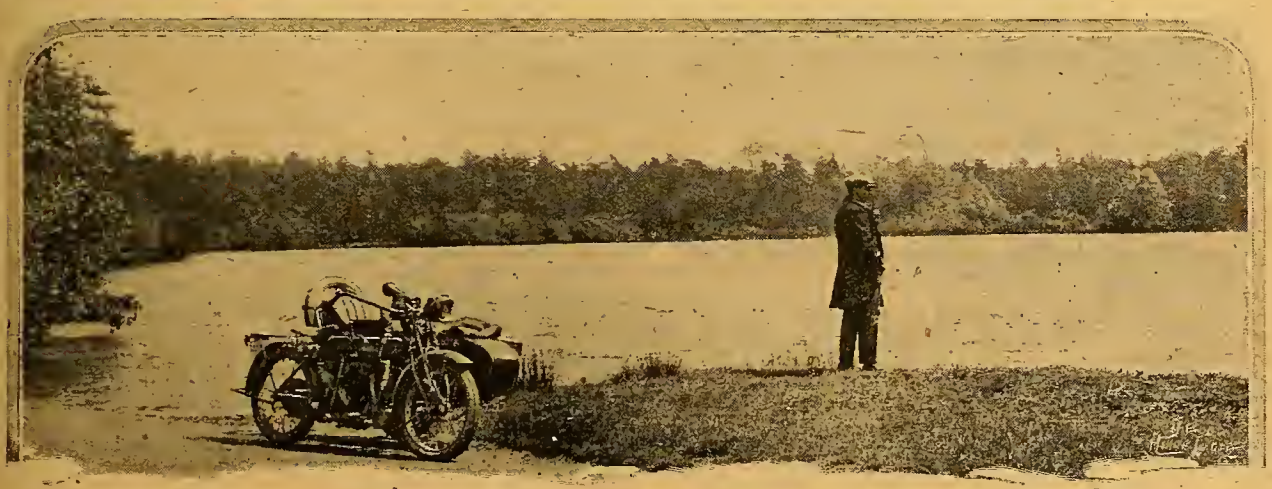
Good Trading.

Although industrial difficulties affected output during the year, the balance-sheet of the Triumph Cycle Co., Ltd., is satisfactory. The final dividend on the ordinary shares is 7½%, which, together with the interim dividend, makes a total of 10%. The trading profit for the year was £80,014.

Catalogues Received.

John Marston, Ltd., Sunbeamland, Wolverhampton: A preliminary list of Sunbeam 1923 prices.

S. Smith and Sons (M.A.), Ltd., Great Portland Street, London, W.C.: Details of several motor cycle accessories, such as the M-L Maglita, the M-L magneto, K.L.G. plugs, clocks, speedometers, and other useful oddments.



THE ETERNAL ATTRACTION. Like the majority of people, motor cyclists seek out stream, river or pool by which to rest and have a quiet smoke. A scene at Wisley Hut on the Portsmouth Road.

The Editor does not hold himself responsible for the opinions of his correspondents.

Correspondence should be addressed to the Editor, "The Motor Cycle," Dorset House, Tudor Street, E.C.4, and must be accompanied by the writer's name and address.

STEERING ON BANKED TRACKS.

Sir,—Recently I have been interested to notice the increasing vogue of an adjustable friction device on the steerheads of certain of the faster machines on Brooklands.

It would be interesting to know if such devices are used throughout the complete circuit of the track. I have heard it stated that if a machine is travelling on a banked track with a banking angle exactly suitable to its speed, no movement of the front wheel is required, and that the act of inclining the machine normal to the banking is sufficient to cause it to turn; while others contend that the direction of the front wheel must be perpendicular to the radius of the curve at any given point, *i.e.*, the front wheel must be slightly turned relatively to the machine. Possibly some of your readers could explain which point of view is correct.

Glasgow. K.E. 9645.

AUTOMATIC SIGNALLING.

Sir,—I do not quite understand Mr. Broadbent's line of argument. He states he cannot see how you arrive at the conclusion that automatic signalling has only met with limited success on railways, and then in the next paragraph goes on to say that it is impossible to install automatic signals at crossover points. Surely Mr. Broadbent by saying this supports your view as to the limited success.

It may interest Mr. Broadbent, and possibly others, to know that the North-Eastern Railway has had automatic signals on a ten-mile section on the main line between York and Darlington for the past thirteen years, and that the main line traffic, including the fastest *booked* train in England, has run over this section during that period without a mishap due to failure of the automatic signalling scheme, but—and here the limited success comes in—it is necessary to have mannally-operated signal frames at the junctions; these signals are, however, electrically controlled by the automatic equipment. A. P.

Darlington.

SOLID TYRES FOR MOTOR CYCLES.

Sir,—With reference to your article "Solid Tyres on Touring Machines," in which you state that the wear and tear of the roads must be greater with solid than with pneumatic tyres, might I, as a surveyor and a student of the science of road-making, point out that in reality the pneumatic tyre effects greater damage to roads than practically any other type.

As doubtless you are aware, pneumatic tyres bulge slightly according to the air pressure therein and the speed at which the vehicle is being driven and the weight thereon. The effect of this bulge is that it acts as a continual sucker, drawing small particles of material from the road, which become disintegrated and cause dust. The material of the road, on losing these particles which bind it together, becomes exceedingly dusty, and with this sucking action, eventually becomes torn up and very loose.

Heavy commercial motor traffic does, comparatively speaking, very little damage, not being fitted with pneumatic tyres, but with solid ones, and instead of clinging to the road, as a motor cycle travelling at speed would do, merely rolls over it; but this type of vehicle has many other means of damaging roads without fitting pneumatic tyres.

A pneumatic tyre does far greater damage to a road in dry, hot weather, when the surfaces of the road have been "baked" by the sun. These remarks apply particularly to macadam roads. In order to show the particular sucking powers of a pneumatic tyre, on the Bath Road during the week-end stones and pieces of road material from one-eighth to half an inch have been found to be torn up, even though the road had been made of the best materials obtainable for the work.

In my opinion, a solid tyre on a motor cycle would not do so much damage as a pneumatic tyre for the above reasons. SURVEYOR.

London, S.W.8.

Sir,—I have been many times in the first (1913) Trojan car, which is still running with the same reliability as a new one.

Leylands did their best to smash this foolproof and unbreakable car (for eighteen months) over their cinder dump and railway sleepers.

The coupé model has pneumatics tyres fitted "to overcome prejudice," so that when the owner finds that it makes no difference in the springing he will gladly revert to the 1,500 mile 30s. a time solids.

STUART LESLIE.

["1.500 mile" may possibly be intended to read "15,000 mile."—ED.]

PREJUDICE AGAINST PILLION RIDING.

Sir,—Whilst not wishing to open up a discussion for or against the popular pastime of pillion-riding, I should like to bring to notice the unfair criticism prominently levelled at this form of sport by a prominent London daily newspaper.

Practically every week a list of accidents, always stated to be due to the presence of the second passenger, is given a prominent position, and the paragraph invariably ends by calling upon the authorities to pass a law to put an end to this dangerous practice.

You can well imagine my surprise the other morning on seeing a leader headed "Good Hunting."

Starting off by giving a list of killed and injured so far this season, this champion of life saving in sport ends by the following remarkable paragraph. "It is this risk which makes fox-hunting one of the greatest of sports. In most the dangers are only for the hunted . . . the hunter waits in security for his quarry. . . . Man was born a hunting animal. Civilisation has too often given him a safe skin while he hunts."

My only comment is that it is praiseworthy to lose your life or limbs in a sport costing about £15 per minute, therefore, only for the wealthy, but, to do so by pillion-riding is deliberate suicide, and should be legally withheld from the usually not too affluent motor cyclist. E. M. COOPER.

THE MATHEMATICS OF "HANGING-ON."

Sir,—Oh! "Schnaps," why damn a perfect exposition of mathematics by an incorrect application of them? In my previous letter I was comparing *resistances*, and resistance is a *force*, it is not *work*.

It would be perfectly correct to say that the *work done* by a cyclist in a unit of time in overcoming tractive resistance at 30 m.p.h. is 30 times the work done at 1 m.p.h. But similarly, the work done in overcoming air resistance at 30 m.p.h. in the same unit of time is 900×30 times the work done at 1 m.p.h. So why drag in the common factor of 30 at all? I omitted it and compared the forces only.

I have been accused of "sheer ignorance," and now of "scientific inexactitudes": perhaps some other correspondent will now oblige with a further exposure of my faults.

High Wycombe. "BENEDICT."

AT THE TOP OF ITS CLASS.

Sir,—I have been much interested in the article in defence of the high-priced sidecar.

The principal *casus belli*, of course, is the Rover "8," and I think if manufacturers of sidecars gave some thought as to the reason of its instant popularity they might manage to market an outfit which would capture the thousands who, as your contributor rightly says, have not motored before, and are now buying Rovers.

To deal first with the allegation of "extravagance" in this type of vehicle, I submit the following figures. Assuming an m.p.g. of 45 for the car and 60 for the sidecar, a difference of £8 in tax and insurance, £3 for tyres; 3,000 miles per annum, extra cost of car £12 14s., 5,000 miles per annum, extra cost of car £13 10s., a difference of 1.05 and .65 pence per mile respectively. Most people garage their sidecars at home, and I fail to see why the slight extra size of a car should entail any extra outlay.

The average buyer requires a vehicle which may be used as an all-round hack—not for Alpine tours—a vehicle in which the driver need not dress like an Esquimaux for a five-mile rainy trip—a machine in which it is possible to converse in comfort at 20 m.p.h., and finally which may be cleaned in the minimum amount of time.

These being the requirements, it is not surprising that a chassis, designed on eminently sound engineering principles—inferior neither in material or workmanship to a high-grade outfit, and combining the weather protection of an enclosed car with a degree of silence, seldom, if ever, met with in a sidecar, and running at a cost from .5 to 1.0 pence per mile greater than a sidecar—should attract so much attention. When, however, some manufacturer turns out a sidecar outfit more on the lines of your artist's sketch at a cost some 25% less than the Rover his sales will bring their own reward.

I have no connection with either sidecar or light car manufacturers. B. ENG.

Rugby.

Sir,—In February, 1921, I entered the ranks of the motorists, and at that time I was doubtful whether or not to expend my money on a high-class sidecar outfit or invest in a small car. After a great deal of consideration, which was obviously not backed by experience, I purchased a two-seater, air-cooled cycle car, and, although the price was in the neighbourhood of £240, at that time it was considered to be one of the cheapest four-wheeled vehicles of its class.

There was no doubt in my mind at the time and immediately after my first run that I had secured a machine which would give me every satisfaction, and, further, would protect myself and my passenger from any rough weather we might perhaps have to encounter.

After 250 miles' running I began to doubt the wisdom of my purchase, and after 500 miles the machine was, to my mind, practically useless—very bad hill-climbing, tyre trouble, difficult starting, and serious overheating of the engine, to say nothing of magneto and transmission trouble—and, although many expert people had the car in their hands, they were unable to do anything with it.

At a loss of over £80 I sold the machine and purchased a Matchless sidecar outfit.

A vast difference was noticed in every possible way, and during the whole time the outfit was in my possession—and this was over a year—I did not experience the slightest difficulty in any shape or form; I knew I could always take the machine out at any time and expect to do a journey anywhere I wished to go.

Again, in May this year, I thought I could obtain the same satisfaction from a well-known four-wheeled cycle car, and consequently disposed of my reliable sidecar outfit and with an extra amount of money took over my new acquisition.

I found everything in perfect order, and at last thought I had obtained a car which would enable me to go anywhere without the slightest trouble.

Unfortunately my theory did not work out correctly, and up to the present the makers have seen the car no less than seven times. I will say that, with the exception of a main bearing seizure (which occurred whilst in the hands of a relative), all the troubles I had to contend with were petty, but I do so wish that I could enter the garage and know that the engine could be started without a hitch.

It is not surprising, therefore, that I am getting a little "fed up" and begin to sigh for the reliable machine which I had on three wheels. XL 754.

London, E.C.2.

T.T. SPEEDS ON THE ROAD.

Sir,—Are "Zenooth" and his followers pulling someone's leg, or have they invented a new "dope"?

London, S.W. 499 TRIUMPH.

Sir,—I do not agree with Mr. C. B. Bickell, as, personally, I would rather meet a "week-end summer rider who potters about, and needs to think twice in an emergency," than a speed-merchant who does not have the time to think *once*, let alone twice. SATIS.

Glastonbury.

Sir,—I am sure that the definite cancellation of the proposed Amateur T.T. has been received with widespread feelings of regret; and I am surer that our feelings are the more poignant after reading some of the claims of your "road-burning" correspondents. Amateurs who can average 40-50 m.p.h. under everyday road conditions are obviously the men we want over in "the island" for the amateurs' race, if the standard of riding excellence is to bear comparison with the performances of our professional experts.

I have noticed that when averaging 24 m.p.h., one can pass *most* things on the road—most riders and car-owners seem to jog along at about "30," with a slight reduction of speed when passing through villages and small towns. This generally brings the average down to about 22 m.p.h.

It is strange that none of our well-known speedmen ever rush into print concerning *their* best road "averages." Perhaps if C. P. Wood, Watson-Bourne, or, say, F. W. Dixon were to give us their experiences, we would get something authoritative and, I am sure, very interesting.

Newcastle-on-Tyne. "QUIXIX."

Sir,—Last July or August you were good enough to publish a protest of mine against the modern tendency to speed. I have made careful inquiries since, and I find that medical opinion is strongly against the effects of the wind resistance set up by the great motor cycles which hurtle along our main roads at anywhere between 30 and 80 miles an hour.

Many of my friends, including the local police constable, who is an extremely good man, agree with me that if the present 20 m.p.h. speed limit were abolished, someone would be killed.

May I, as an unbiased spectator, who has some little knowledge of the mechanical side of motor cycles, suggest that machines ridden "solo" should have a limited piston displacement of 150 c.c., and sidecar machines 250 c.c. This would increase the efficiency of engines, and therefore be a great economy in fuel and oil.

I fear a few of the wrongly-termed "sporting" fraternity will call me a silly man, but I am prepared to defend my suggestion. I have mentioned it to several motor cyclists, and they all finally agreed with me that the community in general would benefit greatly, and that motor cycling would be within the means of many more.

A. O. RUSSELL.

HUMIDITY AND POWER OUTPUT.

Sir,—On a Ford car I got 34% and a friend of mine got, on a Ner-a-car, 25% better results by using an Empire economiser in conjunction with an air moistening device.

In reply to "Experimentor's" query regarding the absence of misfiring in a charge mottled with water spray, I found that moistened air is in suspension with the gaseous mixture, and under compression breaks up into oxygen and hydrogen gases, so causing no misfiring or internal effects of rust. HUMIDIFFUSER.

London, N.W.1.

CASTOR OIL IN ENGINE LUBRICATION.

Sir,—I am sure hundreds of your readers will agree that Castrol R is not harmful to internal combustion engines. From my own experience I can say nothing but praise for this excellent lubricant, and it is usually conceded that an ounce of practice is worth a ton of theory.

The last time I dismantled my 490 c.c. Norton, which had then over 12,000 miles to its credit, I found all bearings perfect. This speaks well for engine and lubricant, considering I use the same machine for hill-climbs, speed events, and reliability trials, as well as for business and pleasure. I should also like to mention the great economy of using this oil.

I have no interest in Wakefields or Nortons, or any oil concern. LESLIE H. SHARP.

Sir,—I have read with interest the article which you have published on the use of castor oil for motor cycle lubrication. The correspondence aroused thereby has been most interesting, but I do not think that any of the writers have quite got at the real advantages which castor possesses over mineral oils.

Frictional resistance in a bearing, where the surfaces are separated by an oil film, is wholly viscous, and the heat produced raises the temperature of the thin film of lubricant which is a bad conductor of heat, and from which the heat escapes but slowly by conduction. The quantity of heat developed may be so great, and the lubricant consequently become so fluid that it is incapable of sustaining the load, and the bearing may seize. This seizing, when the loads are considerable, owing to the reduced viscosity brought about by increase of temperature, is somewhat more pronounced when mineral oils are used than is the case with vegetable lubricants, for the viscosity of the latter does not fall off so rapidly with rise of temperature, as is the case with the former. So that although mineral oils can be, and are produced, having the same viscosity as castor oil at ordinary temperatures, yet it does not follow that they will be of equal lubricating value.

However, viscosity does not play such an important part in lubrication as one would expect, because lubrication depends upon other less generally understood and somewhat obscure properties.

As a matter of fact, a lubricant may have the required viscosity and yet not be a lubricant. A liquid in order to act as a lubricant must possess enough body or combined capillarity and viscosity to keep the surfaces between which it is interposed from coming in contact. Mineral, unlike animal and vegetable oils, seem for the most part deficient in this property of forming thick permanent films.

When a grease is rubbed between the fingers it will be found that they slide freely over one another even when pressed together with considerable force, due to the fact that the grease has formed a thick film which is not easily displaced. The corresponding property in the case of liquids is called "oiliness," which is the property that prevents the lubricant from being easily pressed out. Different liquids possess this property in very different degrees. Thus, although sperm oil is much less viscous than glycerine it is a far better lubricant. The glycerine feels harsh between the fingers, whilst the sperm oil feels smooth and greasy. The viscosity of an oil, therefore, by no means furnishes its lubricating value, and this property of viscosity has to be combined with that of "oiliness."

Oiliness is generally possessed most markedly by the animal oils, less so by those of vegetable origin, and least of all by mineral oils. It is on this account that fixed oils are so frequently added to mineral oils, for they give to the latter just that property in which the mineral oils are most deficient.

It has been found by actual experiment that an internal combustion engine, when using castor oil for lubrication, will maintain a much higher average number of revolutions per minute that the same engine attained when using a mineral oil for lubrication. The explanation of this is probably embodied in this property of oiliness.

Castor oil actually does cause corrosion of the vitals of a motor cycle engine when used for lubrication—I have repeatedly proved this by analysing the carbon deposits, which invariably contain free fatty acids. But this disadvantage is more than counterbalanced when one takes into consideration all its advantages, *e.g.*, non-solubility in petrol, high viscosity, which remains high at increased temperatures, and its oiliness, and it is the combination of these three characteristics which make it so valuable to racing men.

L. F. WRIGHT.
Research Chemist.

CARBON DEPOSIT ANALYSED.

Sir,—After reading the article by Mr. G. Middleton on the composition of carbon deposit, I was prompted to make an analysis from the cylinder head of a 349 c.c. Douglas engine.

The analysis varies considerably from his, and may be of interest. I may state that the carburetter had no gauze in it.

Oleaginous Carbon	75.30%
Ash	24.70%
	100.00%

Analysis of the ash gives the following results:

Silica SiO_2	28.72
Ferric Oxide Fe_2O_3	53.24
Alumina Al_2O_3	2.81
Copper Oxide CuO	9.76
Manganese, etc., etc.	5.47
	100.00

The silica residue was examined and found to contain fairly large particles of flint, some of which were quite one-sixteenth of an inch in diameter.

The copper present was derived from the copper insets at the end of the gudgeon pin, and due to their friction with the cylinder wall.

No doubt a small proportion of the iron present was obtained from the road; the fact that alumina and manganese were present points to this, as these three are usually found together in nature.

In concluding, I may say that this large percentage of iron present is not due in any way to under-oiling, as I usually over-do things where oiling is concerned. A.D.G.

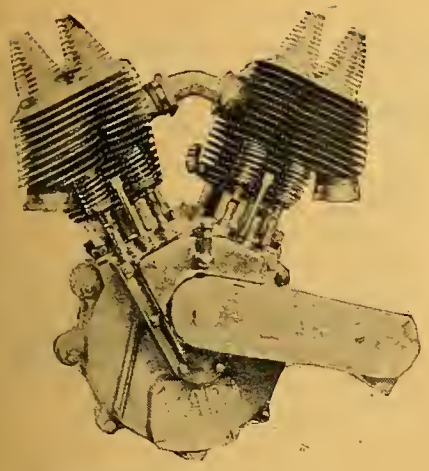
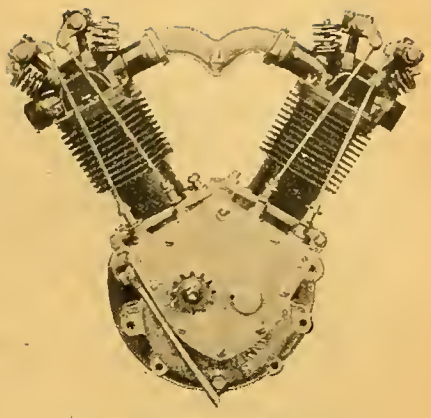
PROPRIETARY ENGINES FOR 1923.

Almost Every Requirement in Type or Size of Power Unit is Produced by Specialist Manufacturers.



976 c.c. J.A.P.
(50°, 85·5 × 85 mm., side valves.)



696 c.c. BLACKBURNE.
(60°, 71 × 88 mm., overhead valves.)

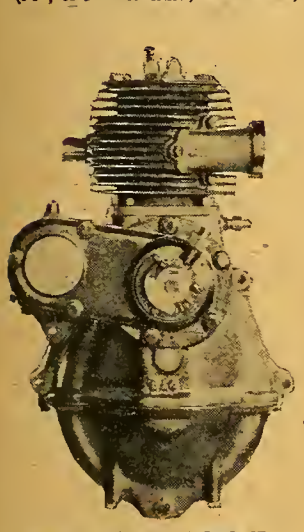
A PROPRIETARY engine described in the simplest terms is an engine available on the open market to all who build motor cycles.

Naturally, the larger manufacturers make practically every part of their machines in their own works, but many firms of the highest repute buy power units from specialists in engine construction.

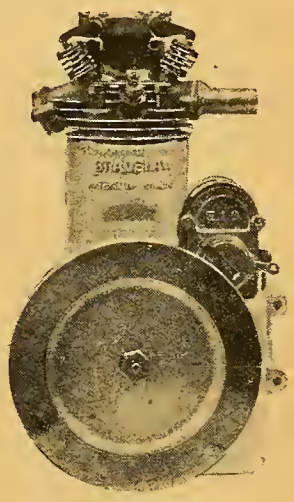
Curiously enough, while the best known makers of complete motor cycles flourish in the Midlands, several of the better known proprietary engine makers hail from London and the South.

The popular J.A.P. is not only our oldest proprietary engine, but one of the earliest British-made engines, and it is interesting to record that in 1903-4 it was fitted to the first motor bicycles made by firms which have since reached the highest rank. It competed against the then invincible Continental makes in 1904 and 1905, and was soundly beaten, but its makers stuck to their work, with the result that the modern J.A.P. engine can, and does, triumph brilliantly wherever it is used. J.A.P. engines are available in capacities ranging from 250 c.c. to 1,080 c.c.

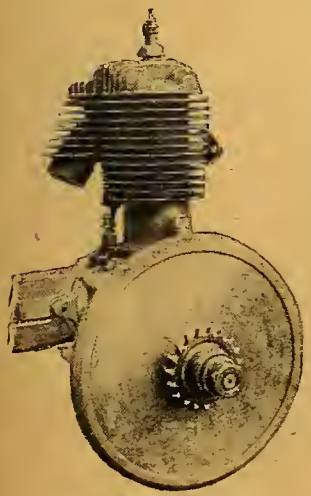
Next in order may be mentioned the Blackburne, originally known as the De Haviland. The range of Blackburne sizes has gradually been extended, and all types from 250 c.c. to 1,098 c.c. are made. As originally designed, with one piece crankshaft, split big end, outside flywheel and detachable head, the Black-



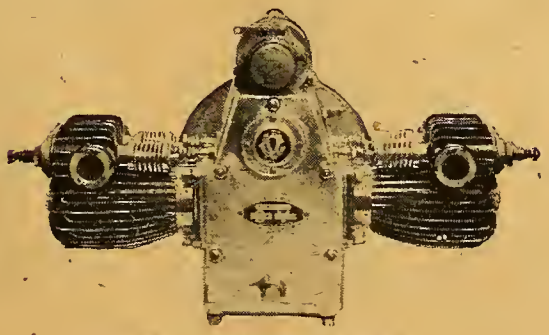
499 c.c. BARR & STROUD.
(86 × 86 mm., single sleeve valve.)



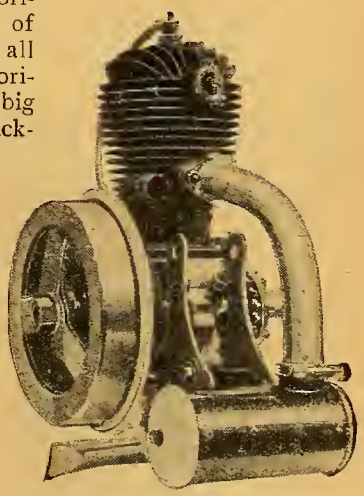
349 c.c. BRADSHAW.
(68 × 96 mm., overhead valves, oil-cooled.)



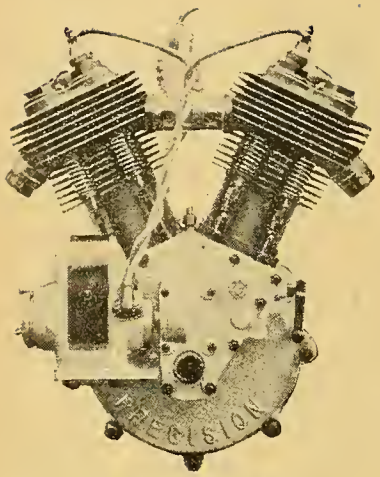
249 c.c. BLACKBURNE.
(60 × 88 mm., side valves.)



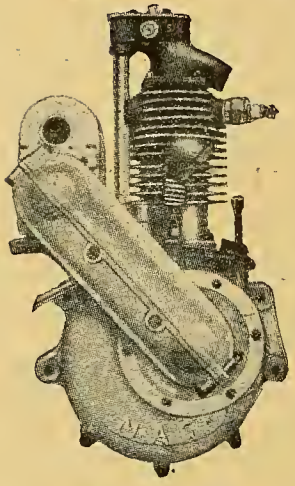
688 c.c. COVENTRY VICTOR.
(180°, 75 × 78 mm., side valves)



343 c.c. VILLIERS.
(79 × 70 mm., two-stroke, flywheel magneto.)



1,090 c.c. PRECISION.
(50°, 85 × 96 mm., side valves cycle-car type.)



346 c.c. M.A.G.
(72 × 85 mm., overhead inlet valve.)

998 c.c. BARR & STROUD.
(50°, 86 × 86 mm., single sleeve valves.)

burne units had a long run of success, but latterly some of those features have had to give place to more progressive developments, chiefly in regard to the adoption of ball and roller bearings.

A Well-known Swiss Engine.

Among Continental engines, the only one which has ever attained popularity in England is the superbly-made M.A.G., the initials of which stand for the title and address of the firm—Motosacoche, Acacias, Geneva. The word Motosacoche means "motor in a toolbag," the name given to one of the early lightweights which grew from a miniature then rated at 1¼ h.p. through bigger and bigger sizes until, for the British market, the 993 c.c. and 1,098 c.c. big twins have been specialised; smaller twins are available, however. Two small singles also come from the M.A.G. works.

A distinct departure from ordinary practice is the sleeve-valve B. and S. engine made by the famous scientific instrument makers, Barr and Stroud, Ltd., of Anniesland, Glasgow, under Burt's patents. The type of single-sleeve valve used first saw the light in the Argyll and Picard-Pictet car engines. Silent in operation and yet highly efficient, the B. and S. is rapidly attaining the popularity it deserves; for 1923 the 350 c.c. engine is supplemented by another single of 500 c.c. and a V twin of 1,000 c.c.

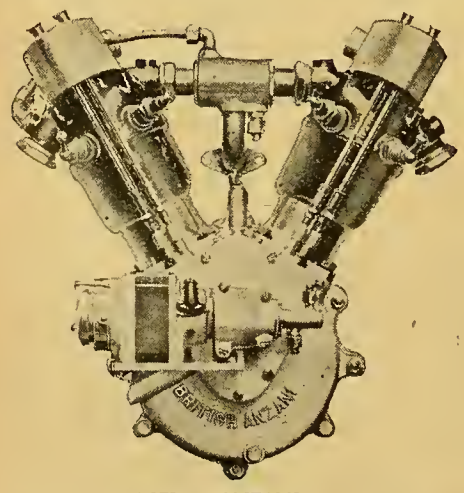
Big Twins and Little Two-strokes.

Finally, among the four-strokes must be mentioned the British Anzani, which is a highly efficient, beautifully made twin-cylinder of 986 c.c. and 1,075 c.c. capacity, which has met with considerable success on the track.

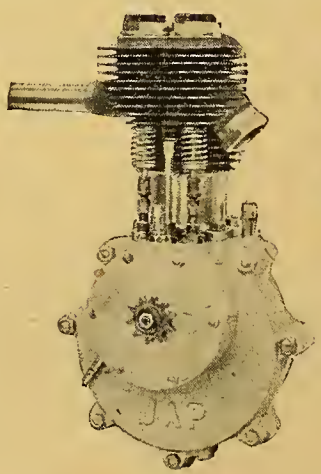
In the Coventry Victor we have the only flat-twin proprietary engine. It has been on the market for several years, and has given great satisfaction. Only one capacity (688 c.c.) is offered.

We now come to the two-stroke proprietary engines, of which the most prominent is the Villiers, the pioneer of its type.

Being early on the field, its makers have brought the Villiers engines to a high state of efficiency, and



1,078 c.c. ANZANI.
(57°, 85 × 95 mm., overhead valves, water-cooled.)

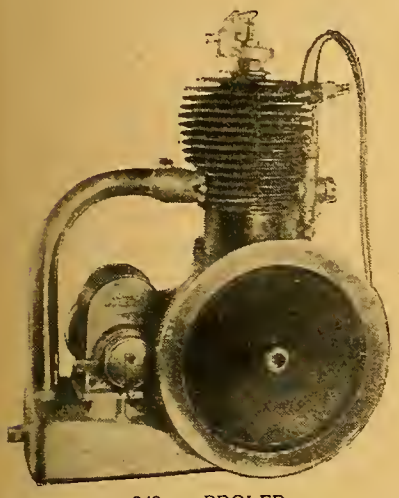


346 c.c. J.A.P.
(70 × 90 mm., side valves.)

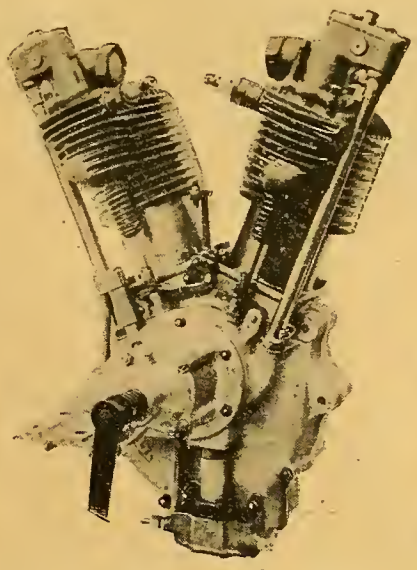
1,090 c.c. BLACKBURNE.
(60°, 85 × 96 mm., overhead valves, water-cooled.)

Proprietary Engines for 1923.—the introduction of a flywheel magneto, which now serves to provide lighting as well as ignition current, has gained them further popularity.

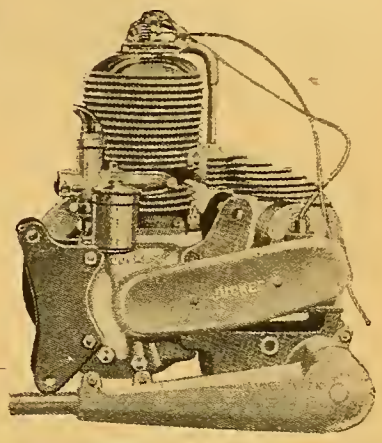
Other two-stroke proprietary engines are the Broler and Juckes, the latter is a new proposition introduced by the maker of the well-known Juckes gear boxes.



349 c.c. BROLER.
(75 × 79 mm., two-stroke.)



1,098 c.c. M.A.G.
(45°, 82 × 103·5 mm., overhead inlet valves.)



277 c.c. JUCKES.
(70 × 72 mm. two-stroke.)

Seeing 1922 Events in Comfort. What the Film Portrays.

DURING the present week motor cyclists in London have the opportunity of seeing *The Motor Cycle* film at the Broadway Cinema, Hammersmith, which is so easily accessible from Olympia.

After the final performance two identical films will be put into circulation, one in the south and the other in the north of England.

Those who are looking forward to the exhibition in their own locality of this interesting pictorial history of 1922 motor cycle events will be glad to know exactly what *The Motor Cycle* film comprises.

First comes the M.C.C. club championship for *The Motor Cycle* Cup, with scenes at the start on a by-road near Tring. Familiar faces among officials and competitors are recognisable, and in one view Mr. "Timekeeper" Bidlake is seen in characteristic attitude. A view of Kop Hill on a typical 1922 summer's day with rain falling and wind-tossed trees is an attractive feature, and an excellent idea of the 1 in 5 gradient is given.

Numerous as was the crowd of motor cyclists who visited the Isle of Man this year, there is a vast majority which never has the opportunity of witnessing the T.T. races. For these the 1922 events will be run again as really live happenings. First is seen the embarkation of machines at Liverpool. Next is shown the start of the Lightweight and Junior races, incidents at Sulby Bridge, the Ramsey hairpin, Craig-ny-baa, and the Junior T.T. winner, T. M. Sheard, the Manxman.

Similarly is the Senior Race dealt with. One can observe the nervous tension in the competitors' faces as they await the word "Go." The film shows a scene at Quarter Bridge, fast cornering at Braddon Bridge, the negotiation of the difficult turn at Governor's Bridge, incidents at the replenishment depots, and finally a picture of the victorious Bennett.

Scenes from two more M.C.C. events follow. The first is in the London-Edinburgh Run, showing the competitors on "The Struggle" at the summit of Kirkstone Pass. But their efforts are nothing to those of the riders on Beggar's Roost in the club's Easter event, London to Land's End. The gradient is 1 in $3\frac{1}{2}$, up which machines, wreathed in smoke, skid and dodge the awful surface, while the riders "bump" in their saddles in order to secure wheel grip.

Next follows a section of film prepared by *The Autocar* showing a few incidents in the Junior Car Club's General Efficiency Trial. Professor Low is seen working his audiometer, and there are pictures of the acceleration test and an exciting incident in the climb up the test hill.

Fast cornering in the T.T. Car Races, especially at the Ramsey hairpin, and Sulby Bridge are included and there are some fine views of the French Grand Prix, which give the start of the cars (led by the winning motor cyclist of the previous day's event), speed on the straight stretches, and excellent riding at the sharp corners.

A sensational American section follows. Cars skid round the pylon (in this case a barrel) on Daytona Beach, and so fast do they flit by that the eye is dazzled.

Then there is an American hill-climb which may give an inspiration to club secretaries and trials organisers. Heavy machines attempt the ascent of a trackless hill of 1 in 2. Practically all fail and topple over backwards, while the riders narrowly escape injury; spectators in their thousands turn up in cars to see the "sport." Certainly it is a thrilling exhibition.

An excellent view of cars speeding round an American track is shown, and then we return to Europe to witness scenes on Amulree and Kenmore in the Scottish Six Days Trials.

Snow cars performing in the French Alps provide another attractive feature, and finally comes the motor cycle Grand Prix at Strasbourg, where the machines are started off in batches, class by class, speed past the grand-stands, and stop at replenishing cages. At the end the Greek Psalty, the Paris agent of the winning 250 c.c. machine, subsides into ecstasies at the success of Davison, while Bennett, the T.T. hero and 500 c.c. winner, is carried shoulder high by his colleagues.

Truly a fine entertainment, which lasts about forty minutes.

THE MOTOR CYCLE FILM:

NOW SHOWING IN LONDON

at the

BROADWAY CINEMA, HAMMERSMITH.

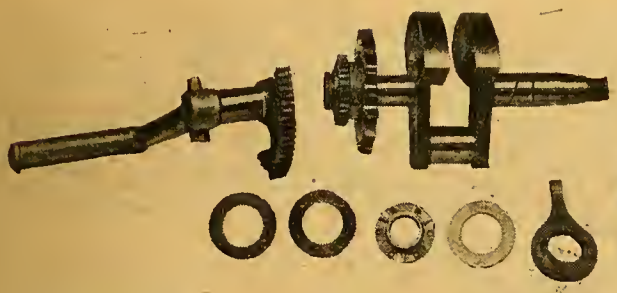
(Five minutes from Olympia.)

All the principal motor cycle events in 1922. T.T. Races in the Isle of Man, Grand Prix Races in France, Reliability Trials at home, and "stunt" hill-climbs and races in America.

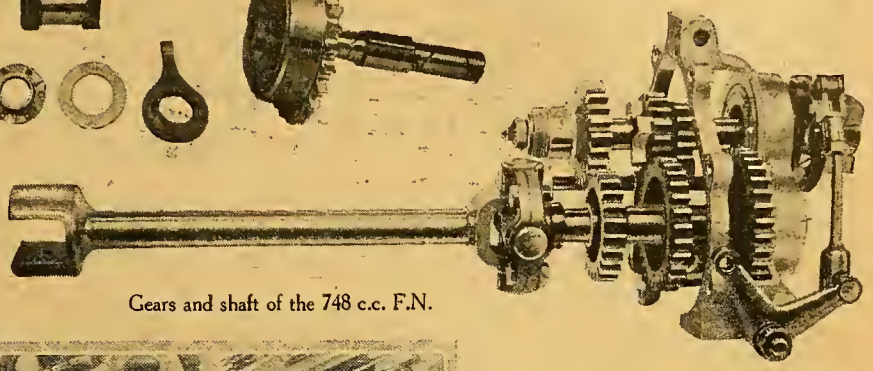
Prices of Admission: 2s. 4d., 1s., and 8d. 2s. 4d. seats may be booked in advance. Tel.: Hammersmith 718.

After Saturday next the Film starts on its tour of London and provincial clubs.

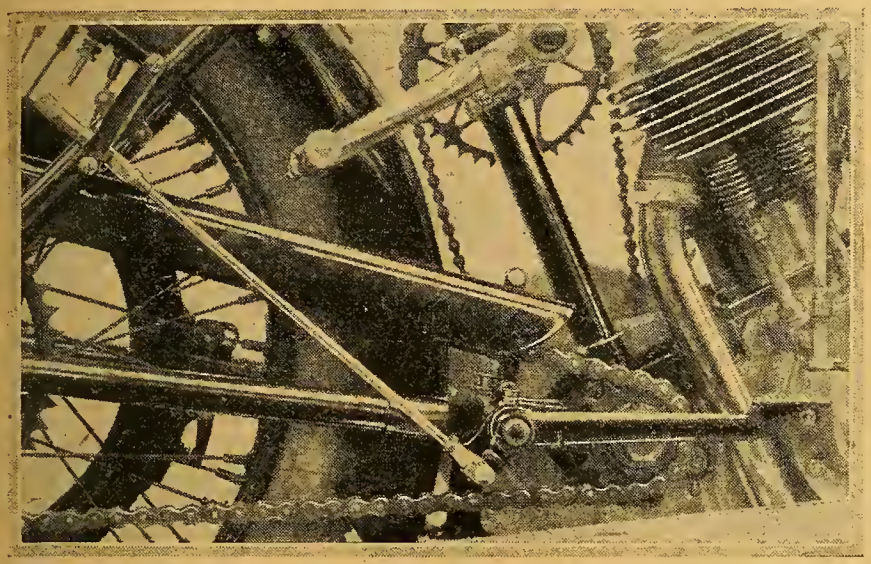
INTERESTING DETAILS OF MOTOR CYCLES AT OLYMPIA.



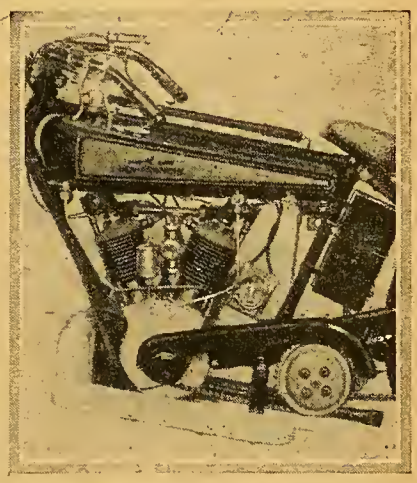
Gear-shaft and clutch crankshaft and kick-starter, details of the latest two-stroke Triumph lightweight.



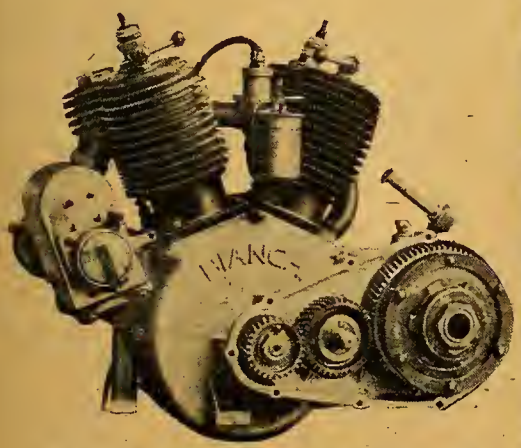
Gears and shaft of the 748 c.c. F.N.



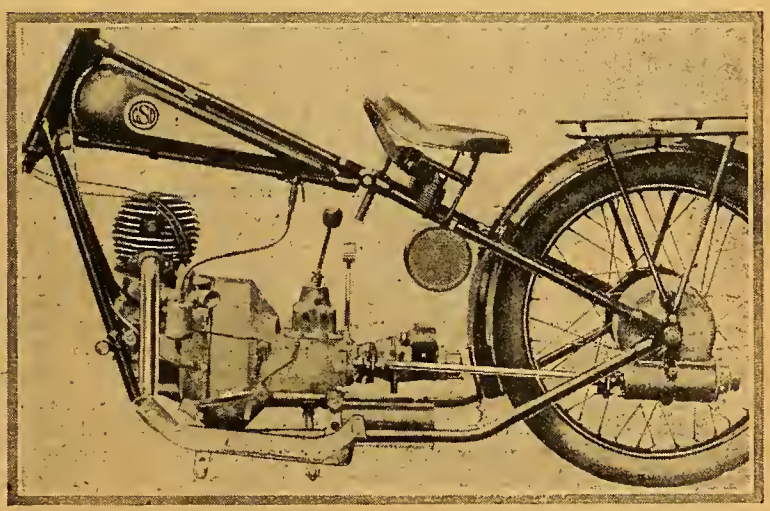
A feature of the Royal Enfield is an ingenious lock which permits rear brake pressure to be maintained without effort on part of the driver.



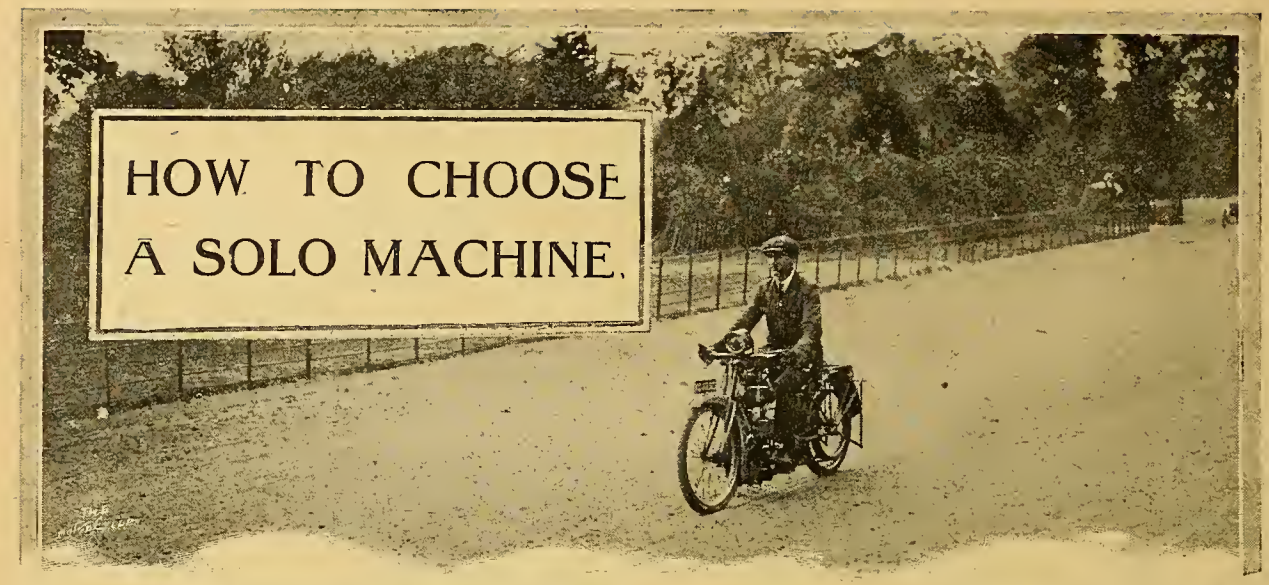
New tank and frame of the largest Lea-Francis, which has a 592 c c. M.A.G. engine.



The Bianchi, like the Harley-Davidson flat twin and the new Triumph, employs spur gears in the primary drive.



Engine and four-speed gear unit, frame and transmission layout of the 350 c.c. G.S.D.



HOW TO CHOOSE A SOLO MACHINE.

Limiting One's Choice by a Study of Requirements. Selecting from the Final Choice.

By "ROAD RIDER."

VERY few novices go seriously astray in picking their first machine, chiefly because the general average of quality is now exceedingly high.

It is very rare for a big factory to turn out a poor machine; and when the products of a small firm are concerned, the engine, gear box, carburetter, ignition, forks, etc., are generally manufactured by some famous component works, so that the complete assembly is likely to give satisfaction.

Thus, the novice's only risk of making a substantial blunder hinges on his picking a type of machine wholly unsuited to his needs, as if a weak, timid, elderly man should order a big twin sports model, or some ignoramus with a sporting temperament should foolishly buy a single-geared baby two-stroke.

Such mistakes are committed every winter, but not in large numbers. The novice's regrets, if any, usually centre on his having bought a good example of the right kind of machine, but not the one and only make which pleases him best after a year on the road has educated his taste. For this reason, the most careful thought should be given to defining exactly what is wanted. Buy in haste and repent at leisure.

When the intending rider has analysed his own wants thoroughly, his choice will usually be narrowed to three or four machines; and the advice outlined below in this article should enable him to make the perfect choice.

The Outstanding Quality.

No two men have exactly the same wants, and all of us want more than the most perfect machine can supply. But a little thought will usually identify one factor as topping the list of our needs; and among such factors the following items will figure prominently in the minds of various individuals: Speed, comfort, light weight, hill-climbing, economy, absence of skidding, weather protection, and suitability for night work. Whichever ranks first, the beginner should make full use of any local club. If he can attend one of its meets as passenger in a friendly sidecar, he will come home with his head awhirl from kindly though contradictory advice, but he will have spotted two or three machines likely to suit him.

The speed machine is the easiest to pick. Our back numbers will indicate which machines do best in the T.T. and at Brooklands, whilst many of the fastest machines, such as the Norton, Brough Superior, Scott-Squirrel, are now sold with a speed guarantee. On the other hand, no such guarantee is given with the four-valve Triumph, sports A.J.S., sports Sunbeam, and other popular road-burners, including most of the big twins. But even in this market there are several points to be emphasised.

Maintenance of Tune.

A very small engine does not maintain super tune for long; it is possible to obtain a 350 c.c. machine capable of 70 m.p.h., but a bigger engine, possessing a real reserve of power, is likely to maintain its maximum speed for longer periods. Any fast engine of 500 c.c. and over should remain fast; the speed durability of a smaller engine demands verification.

Secondly, fast road work is more a matter of acceleration than of sheer speed. The machine which can pick up to 40 m.p.h. quickly will beat another which may be 10 m.p.h. faster on the track, but accelerates sluggishly. If the gear box is to be used for accelerating, see that the gears are easy to change, especially if you have to change up from middle to top when the machine is already doing 45 m.p.h.

Thirdly, though a big twin is faster than almost any single, a good single takes less tuning, and will give all the speed which any man can employ on British roads.

If comfort is at the head of your list, big tyres are the surest and cheapest road to it; by "big" I mean 3in. on a 500 c.c. model. These in combination with an ordinarily decent fork and perhaps a super

How to Choose a Solo Machine.—

saddle listed at 63s. or so will flatten any road; and the super saddle is not a necessity. Spring frames vary in efficiency, and some of them are heavy; a trial is desirable. The B. and D. stabiliser is a really good thing; I have ridden over bricks hands off with the help of this device.

Light weight no longer condemns the user to road vibration and weak hill-climbing, as it once did. But lightweights vary far more in quality than the older and more fully-developed patterns. A man who likes something which is easy to handle with its engine stopped can undoubtedly discover a machine which will take him anywhere, and will neither bore nor shake him when he does 200 miles in the day. But he should pick carefully, using the information below, and insist on a road trial.

Hill-climbing.

Hill-climbing is nowadays purely a matter of gear ratios. In hilly counties the buyer should have three speeds, and the bottom ratio should be 15 to 1, or even lower. He need not fear overheating.

Economy depends first upon the quality of the machine; secondly on its size; and thirdly on the rider. Minimum costs fall to the lot of a man who drives sensibly, does not shirk doing his own dirty work (from repairing punctures upwards), chooses a first-class mount, and prefers 350 c.c. to 1,000 c.c. A first-class chain-driven 350 c.c. model is probably the cheapest machine to own.

Skidding is in reality more a matter of the rider's nerves than of mechanics. But on the sort of road which unsaddles many of our crack men in a trial, the best chance of a non-stop falls to him who has (1) a small multi-cylinder engine, mounted low in the frame; (2) a rather low gear; (3) a perfectly smooth drive; (4) wide bars, low enough to put plenty of weight on the front wheel; (5) low weight so as not to make steering clumsy; and (6) a pair of well-scolloped tyres, which beget confidence. But an ordinary rider with a little experience should be able to hold up almost any machine over any normal road. The skidding bogey is exaggerated in the novice's mind.

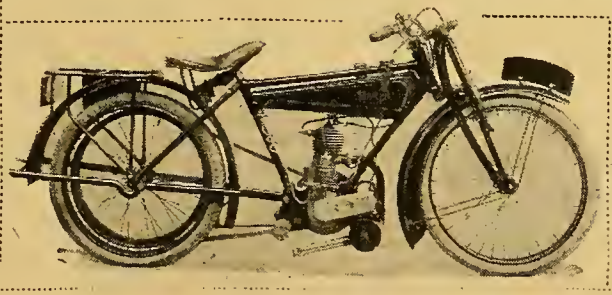
Genuine weather protection is very seldom supplied on standard machines, as comparatively few people want it. It is usually added after purchase in the form of such gadgets as legshields, handle-bar muffs, windscreens, and other proprietary articles. But the all-weather rider should see that his fancied mount has wide mudguards, well clear of the wheel, and that his magneto and sparking plug are out of reach of the mud and water thrown up by the front wheel. For regular nightwork dynamo lighting is well worth its price.

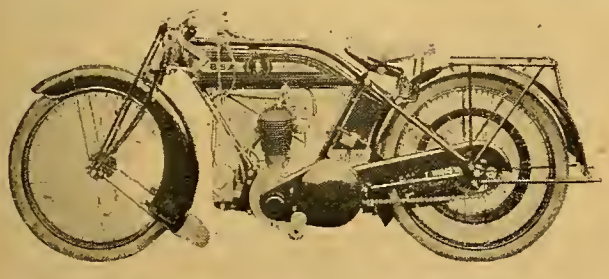
It is always well to see that a fancied machine can be straddled easily, as some saddles are still too high off the ground for stumpy riders to feel comfortable.

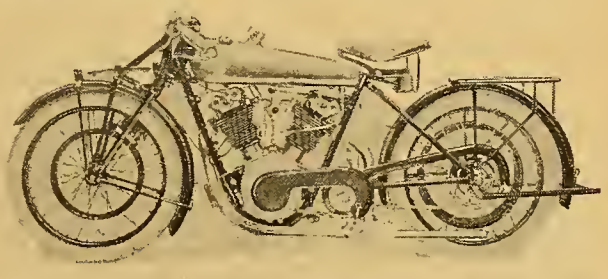
Possibles and Probables.

If the foregoing hints have enabled the novice to rough out a specification of what will suit him best, a visit to Olympia or a collection of catalogues will soon provide him with the names of a dozen machines worth further attention; and he is next confronted with the task of arranging them in his order of merit. If he can actually see them all, he will whittle down the list quite appreciably, but will probably be overwhelmed by the impossibility of separating the two or three final survivors. This, however, is easier than it looks. He has three invaluable assistants in the job. The first is a trial run, which the local agent will readily give. The second is summoned to his side by obtaining those back numbers in which *The Motor Cycle* reported the two big Six Days Trials of 1922. At first sight the results will seem to indicate that every make gets gold medals. But analysis will show that where A earned one gold from, say, six entries, B started four machines, all of which earned golds. A reference to the similar trials in 1921 will broaden the base of these deductions. By this time the choice should certainly have narrowed down to a couple of "possibles." Here again *The Motor Cycle* will stand his friend. Its advertisement columns will reveal how much each machine depreciates per annum. If 1922 machines of C make, bought at £100, are offered at an average price of £80, whereas 1922 machines of other makes listed at £100 command no more than £75 or £70 apiece, C is clearly the pick of the basket, for "money speaks."

Thus the novice with an orderly mind can literally pick out the best machines in each class without expert assistance.







THREE SOLO TYPES. Above is a single geared two-stroke lightweight, representing lowest first cost and simplicity of design. Below it is a medium weight three-speed four-stroke single; the "go anywhere" mount of sturdy proportions. At the right is a sports model big twin; the choice of ardent and expert soloists.

THE MANUFACTURERS' BANQUET.

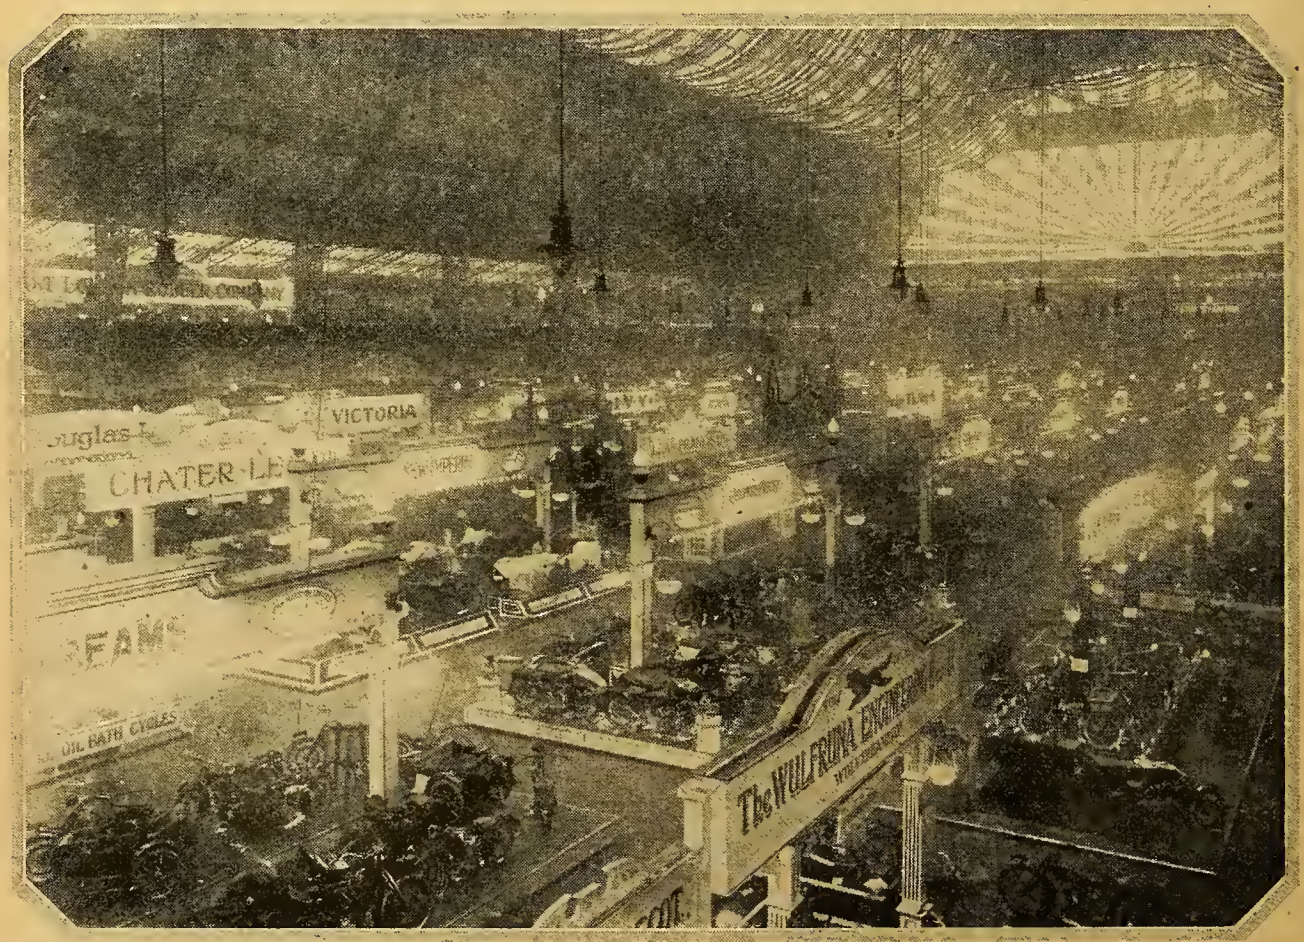
Good Roads Essential—Why not Abolish Doles and Use Unemployed on Road Improvements?—20% Average Drop in Prices for 1923—Importance of Overseas Trade.

MORE brilliant than usual, and with speeches surpassing in quality the usual important statements on the eve of the Show, the eighth annual banquet of the British Cycle and Motor Cycle Manufacturers and Traders Union, Ltd., at the Connaught Rooms last Friday evening, proved a great success. The chair was occupied by the President of the Union, Sir Harold Bowden, Bart. In proposing the toast of the "Cycle and Motor Cycle Industry," Sir William Joynson-Hicks, Bart., M.P., Parliamentary Secretary to the Department of Overseas Trade, dealt with the importance of the industry, the thousands of workpeople dependent upon it, mentioning that some 400 firms were engaged in the production of motor cycles or their components. He regretted the decrease in overseas exports which naturally he regarded as of the first importance, but struck an optimistic note in predicting a reversal of the decline within the next two or three years. Trade, he said, is no longer national, it is international. Twenty per cent., he estimated, represented the average drop in prices this year, and he was confident he saw the beginning of a silver lining for British trade.

In responding, the chairman acknowledged the excellent work of Sir William on behalf of road users in general. The motor cycle industry had passed through a trying and difficult year, but there were a few bright spots, as reflected in certain balance sheets (laughter). He considered stabilisation of foreign currencies the key to a bright future, and ascribed unemployment largely to the falling off of foreign demand. Competition, he said, was keen, and strenuous efforts were being made for business.

A Welcome for Lightweights.

Lightweight motor cycles at £25, he continued, will bring in thousands of recruits, many of whom will later hanker after more power and endurance, and



General view of the Eighth Annual Motor Cycle Exhibition at Olympia. It is open daily from 10 a.m. to 9 p.m. until Saturday, Dec. 2nd.

The Manufacturers' Banquet—

buy more ambitious types of machines. He favoured abolishment of existing taxes, and in place thereof a nominal registration fee, with a petrol tax of 6d. rather than 5d. per gallon, which was the only equitable scheme based upon the amount of use of the roads. He marvelled why the unemployed were not used on road improvements, and drew cheers when he denounced the £261,000,000 issued in respect of doles. Good roads were the secret of the popularity of cycles and motor cycles in this country, and still better roads would mean more orders, more employment, and a nation improved in health.

Overseas Trade the Key to the Future.

Mr. Arthur Brampton, J.P., proposed "The Guests" in a witty speech, coupling the names of the Earl Birkenhead, P.C., and the Rt. Hon. Sir Joseph Cook, G.C.M.G. (High Commissioner for Australia). Lord Birkenhead, at the outset, remarked that he had never indulged in the higher forms of attractive locomotion, but he had raced five times on high bicycles—no, he had never won—he replied to an impromptu question! He said that no office held such a contributory power toward restoration of trade as that of the Department of Overseas Trade. There was no short road to prosperity, he urged, remarking that only four years had passed since the Great War, and much remained to be done to reform the economic life of the world before prosperity could be expected. There was much work ahead, and we should not arrest mischief by simply carrying on in tranquillity. Thereafter he delved into political subjects, and in his typical manner made impassionate appeals of exceptional eloquence, gesticulating the while, with which he completely arrested the attention of the large concourse present.

Business within the Empire.

Sir Joseph Cook, who followed, concurred in the importance of the Overseas Trade Department. He considered those members present looked prosperous enough, and he doubted really if they were living on their losses. He remarked that he had heard before the idea that bad trade was due to taxation: it was, in fact, the tale he heard down under. Australia, he said, was the largest purchaser of British goods in the world, and his advice to manufacturers was to recognise this fact and concentrate their attention upon the Southern Dominions. There was better business within the Empire than out of it, he stated emphatically.

Sir James Percy, D.L., J.P., proposed "The Chairman" in optimistic tone, remarking that with prices of motor cycles, tyres and petrol down the future assuredly called for optimism. He paid eloquent tribute to the many qualities of the chairman, to which Sir Harold Bowden suitably responded.

A BUSY WEEK ON THE TRACK.

Records Fall by the Dozen in Great Show Time Offensive.

DURING the whole of last week there were scenes of unparalleled activity at Brooklands, where record-breakers had concentrated for a final onslaught on record figures before the track closed for the winter, last Saturday. Fortunately, favourable weather conditions prevailed, and day by day the record list underwent considerable alteration. In the six days ended Saturday, no fewer than 49 motor cycle and cycle car records—mostly world's—were broken. The week's doings may, perhaps, best be described in diary form.

MONDAY—Short Distance Records.

The electrical timing strips were in position on the Monday, and all the records made on this day were over the kilometre and mile. Victor Horsman was out on his o.h.v. Norton, both solo and with sidecar, and, in the latter class, was successful in raising the mean speed figure for the flying kilometre to over 80 m.p.h.—a speed which most riders of 500 c.c. machines would be fully satisfied if they could attain solo. W. Sheraton put up some standing start records on a 490 c.c. Norton, but his speeds for the kilometre were shortly afterwards exceeded by F. A. Longman, riding a T.T. pattern 349 c.c. A.J.S. When Longman's machine was weighed, however, it was found to be 5 lb. under minimum weight, whilst his tyres were of less than the prescribed section. Le Vack, on his big Zenith-Jap, made an attempt on the 50-mile record in Class E, but a brass plug in the exhaust valve cap fused after four laps, and the attempt was abandoned.

TUESDAY—Effect of Disturbed Currents.

Le Vack attributed his trouble with a hot back cylinder to the effect of a wide oil tank, placed behind the engine, upon the air current. Changing the position of his plug from the inlet valve cap to the fore side of the cylinder, the engine ran considerably better, and Le Vack started off again to capture the 50-mile record in the 1,000 c.c. solo class (E). He lapped steadily in round about 106.6s., which, on the 10ft. line, is 91.78 m.p.h., whilst, on the 50ft. line it represents 93.44 m.p.h. As has before been mentioned, a motor cyclist lapping at this speed must keep outside even the 50ft. line, so that it will be realised that the speed of 91.71 m.p.h. with which Le Vack is credited for the 50-mile record is considerably below his real average.

WEDNESDAY—50 m.p.g. at 74 m.p.h.

R. N. Judd, on a side-valve Norton, made a meritorious 100-mile run, lapping regularly at about 74 m.p.h. He secured the record for that distance by a small margin, but, shortly afterwards, a broken crank pin at the end of 61 laps forced his retirement. When he filled up at the conclusion of the 100 miles, it was found that he had used barely two gallons of spirit—a consumption which, for a racing machine, is extremely good. Unfortunately for Judd, Emerson (Douglas) broke his 100-mile record on the following day. Le Vack brought out his Zenith, with sidecar attached, and set out for the 50 miles, 100 miles and 1 hour records in Class G. He had completed all but two laps of the 50 miles when he smelt burning rubber, and, looking at the front wheel, saw what he took to be a front stand trailing along the ground. As he had no such fitment, he realised that the fork girder had broken, but he kept going until 19 laps were completed, when it was found that both sides of the fork had fractured, and attempts on longer distance records were, naturally, abandoned. C. G. Pullin next went out on his 344 c.c. Douglas and sidecar, and collected the flying five miles and standing ten miles records (Class B/S).

THURSDAY—Speed Kings Turn Out.

Having fitted a pair of Druid forks to his Zenith, Le Vack started out for the hour and 100-mile sidecar records. He had hardly got going, however, when the clutch started

A Busy Day on the Track.—
slipping (he has used the same Sturmey-Archer gear box throughout the season without attention), and hurried repairs failed to effect a cure. More short-distance records were made with the aid of the electrical strips, Emerson (494 Douglas) securing the standing kilometre in Class C, and Longman—who, by virtue of fitting larger tyres and tank, had brought the weight of his A.J.S. to over the limit of 165 lb.—beat the standing kilometre in Class B.

W. D. Hawkes, driving a Morgan fitted with overhead-camshaft eight-valve Anzani engine, repeated his attack on the flying five miles and standing ten miles records in Class H/2 (two-seater cycle cars not exceeding 1,100 c.c. He had lowered the existing records on the previous day, but, when his machine was examined, tyres of too small section were found to be fitted to the front wheels). This time he improved considerably on his speed, but, as he crossed the finishing line, one of the cylinders suddenly ceased firing, serious engine trouble being the cause.

Cyril Pullin successfully attacked the standing kilometre and mile in Class B/S on his 348 c.c. Douglas and sidecar, and just as it was getting dusk Le Vack brought out his 346 c.c. New Imperial-Jap for the flying five miles and standing ten miles in Class B. He lapped at the astounding speed of nearly 86 m.p.h.—a pace which only two or three men at the track can equal on 500 c.c. machines—and secured the desired records by a handsome margin.

FRIDAY—New 400 miles 500 c.c. Record.

The first on the track the next day was J. L. Emerson (494 c.c. Douglas), who was out for Class C records up to 6 hours. He started away with a standing lap of 75.26 m.p.h., and for the first half hour his average speed was 78 m.p.h. He missed lowering the 50-mile record (which he already held) by 3 secs., and he stopped just before the finish of the first hour (another of his own records) for petrol. After 39 laps he changed a back wheel, and at the end of 46 laps his engine commenced to misfire, a trouble which was cured by changing the exhaust valve spring. He lost about 10 minutes over this, but his 50th lap was the fastest, being at the rate of over 80 m.p.h. After he had beaten the 100-mile record at the very useful speed of 76.97 m.p.h., his helpers signalled him to slow down, and he continued to lap with monotonous regularity at about 68 m.p.h. until the conclusion of the 400 miles, which took place after dark. Incidentally, Emerson's 400-mile world's record beats that which the Garelli recently established at the Monza Park track (Italy).

Whilst Emerson was busy, Le Vack set out for the one hour and 100 miles in Class G (1,000 c.c. sidecars) on the Zenith-Jap, the clutch of which had been tightened up until it would not free. With J. V. Prestwich in the highly uncomfortable sidecar, the laps were reeled off at 74-75 m.p.h., and a perfect run was made, the engine never missing a beat throughout. One of the front wheel spindle nuts loosened itself and caused the steering to become somewhat difficult—the strain that Le Vack must have felt, indeed, was reflected in the blades of the forks, which were actually bent below the steering head. Another rider to put up sidecar records on Friday was W. D. Marchant, riding a 349 c.c. O.K.-Junior with o.h.v. Blackburne engine. He secured the 50 miles and one hour records in Class B/S, and his only trouble on the run was an oily plug—proof of the cool-running of his engine.

SATURDAY—More Long Distance Records.

Saturday, probably being the last day for many months to come when record-breaking will be possible, was a day of feverish activity. The electrical strips were once more in position, although the most noteworthy records made were long-distance. A 1,000 c.c. twin-cylinder Rudge, driven alternately by R. E. Dicker and J. H. Mather, set out early in the morning, and, lapping with great consistency at around 76 m.p.h., managed to break into the record list (Class E) at the end of 6 hours. The 500 miles and 600 miles records were also secured, the machine running in all for nearly 8½ hours, and averaging over 71 m.p.h. for the entire period. Incidentally, it may be mentioned that the 500 miles record at 74.96 m.p.h. replaces that which Le Vack set up (70.42 m.p.h.) in the 1921 500 Mile Race.

Riding his 250 c.c. New Imperial-Jap, Le Vack made a very successful onslaught on the 50 miles, 100 miles, one and two hours' records in Class A. His speed of approximately 68 m.p.h. must be regarded as little short of marvellous. His two-hour record, in fact, eclipses that which was credited to H. R. Davies (A.J.S.) in the next higher class—350 c.c.

W. D. Hawkes took his Morgan-Anzani over the flying kilometre, but further engine trouble prevented his attacking the mean speed figures. F. A. Longman was also successful in securing the standing mile, both normal and mean speed, in Class B on his 349 c.c. A.J.S.

A full list of the records made during the week will be found below.

CLASS A.—Solo up to 250 c.c.

25/11/22.—H. Le Vack (249 New Imperial-Jap).

	m.p.h.
*50 Miles=43m. 44.63s.	68.61
*100 Miles=1h. 29m. 0s.	67.41
*1 Hour=68 miles 955 yards	68.54
*2 Hours=135 miles 1,201 yards	67.84

CLASS B.—Solo up to 350 c.c.

23/11/22.—F. A. Longman (349 A.J.S.).

†Standing kilometre (one way)=35.90s.	62.51
*Standing kilometre (mean)=36s.	62.14

22/11/22.—C. G. Pullin (344 Douglas).

*Flying mile (mean)=41.20s.	87.38

25/11/22.—F. A. Longman (349 A.J.S.).

†Standing mile (one way)=53.98s.	66.96
*Standing mile (mean)=54.405s.	66.17

23/11/22.—H. Le Vack (346 New Imperial-Jap).

*Flying 5 miles=3m. 29.90s.	85.75
*Standing 10 miles=7m. 23.73s.	81.13

25/11/22.—H. Le Vack (249 New Imperial-Jap).

*2 Hours=135 miles 1,201 yards	67.84

CLASS C.—Solo up to 500 c.c.

23/11/22.—V. E. Horsman (490 Norton).

*Flying kilometre (mean)=23.90s.	93.59
*Flying mile (mean)=38.825s.	92.72

23/11/22.—J. L. Emerson (494 Douglas).

†Standing kilometre (one way)=33.9s.	65.99
*Standing kilometre (mean)=34.5s.	65.50

20/11/22.—W. Skeaton (490 Norton).

†Standing Mile (one way)=53.55s.	67.23
*Standing mile (mean)=53.375s.	67.19

24/11/22.—J. L. Emerson (494 Douglas).

	m.p.h.
*100 Miles=1h. 17m. 57.04s.	76.97
*200 Miles=2h. 53m. 50.24s.	69.03
*300 Miles=4h. 29m. 29.63s.	66.79
*400 Miles=6h. 0m. 4.30s.	66.65
*3 Hours=206 miles 1,714 yards	68.99
*4 Hours=269 miles 873 yards	67.38
*5 Hours=331 miles 1,049 yards	66.32
*6 Hours=399 miles 1,584 yards	66.65

CLASS E.—Solo up to 1,000 c.c.

21/11/22.—H. Le Vack (998 Zenith-Jap).

*50 Miles=32m. 42.56s.	91.71

25/11/22.—R. E. Dicker and J. H. Mather (998 c.c Rudge).

*500 Miles=6h. 40m. 12.43s.	74.96
*600 Miles=8h. 25m. 7s.	71.27
*6 Hours=450 miles 654 yards	75.02

CLASS B.S.—Sidecars up to 350 c.c.

22/11/22.—C. G. Pullin (348 Douglas).

*Flying 5 miles=4m. 27.71s.	67.24
*Standing 10 miles=9m. 21.53s.	64.11

23/11/22.—C. G. Pullin (348 Douglas).

†Standing kilometre (one way)=45.45s.	49.21
*Standing kilometre (mean)=45.875s.	48.76
†Standing mile (one way)=66.40s.	54.21
*Standing mile (mean)=66.525s.	54.11

24/11/22.—W. D. Marchant (349 O.K. Junior-Blackburne).

*50 Miles=50m. 21.92s.	59.26
*1 Hour=87 miles 1,305 yards	57.74

CLASS F.—Sidecars up to 600 c.c.

20/11/22.—V. E. Horsman (490 Norton).

†Flying kilometre (one way)=27.55s.	81.19
†Flying mile (one way)=44.55s.	80.81
*Flying kilometre (mean)=27.875s	80.24
*Flying mile (mean)=45.05s.	79.91
†Standing mile (one way)=56.44s.	63.78

CLASS G.—Sidecars up to 1,000 c.c.

22/11/22.—H. Le Vack (998 Zenith-Jap).

*50 miles=39m. 41.20s.	75.59

24/11/22.—H. Le Vack (998 Zenith-Jap).

*100 miles=1h. 20m. 12.88s.	74.79
*1 hour=74 miles 1,532 yds.	74.87

CLASS H/2.—Two-seater Cycle Cars 1,100 c.c.

23/11/22.—W. D. Hawkes (1,088 Morgan-Anzani).

*Flying 5 miles=3m. 31.40s.	85.14
*Standing 10 miles=7m. 20.60s.	81.70

(NOTE.—If the above records are calculated on the basis of the 50ft. line, the speeds are 86.70 m.p.h. and 83.17 m.p.h. respectively.)

25/11/22.—W. D. Hawkes (1,088 Morgan-Anzani).

†Flying kilometre (one way)=25.73s.	86.94

*World's record. †British record.

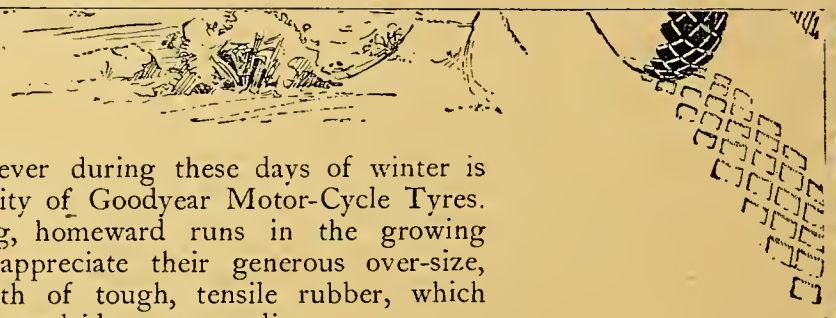
Winter, too, Reveals their Worth



Prized more than ever during these days of winter is the steadfast reliability of Goodyear Motor-Cycle Tyres. It is on those long, homeward runs in the growing darkness that you appreciate their generous over-size, their increased depth of tough, tensile rubber, which banish the dread of roadside tyre mending.

And that sturdy All-Weather Tread with its deep-cut, diamond-shaped blocks that bite through slime and mud—more than ever do those slippery roads emphasise its firm, tenacious grip.

It is comforting to remember, when wintry going suggests the replacement of a worn cover, that you pay no premium for the protection these trusty Goodyear Tyres afford. They are obtainable everywhere from Goodyear Registered Dealers. The Goodyear Tyre & Rubber Co. (Great Britain), Ltd.

26×2½×2¼	-	All-Weather Tread	£1 16 6	-	-	Tube	7s. 3d.
26×3	-	" " "	£2 1 6	-	-	"	7s. 9d.
28×3	-	" " "	£2 5 3	-	-	"	8s. 3d.
*27×3½	-	" " "	£2 12 6	-	-	"	9s. 9d.
*29×3½	-	" " "	£3 1 6	-	-	"	10s. 0d.

* Oversizes for 26×3 and 23×3 respectively.

To make sure that it will reach the user in perfect condition, each Goodyear Tube is rolled, then packed in a waterproof, oilproof bag.

We are exhibiting at the Motor Cycle Show, Olympia, Stand No. 13.

OLYMPIA SHOW REPORT.
TYRE BUYERS' GUIDE.
HINTS AND TIPS.
WHAT THE SHOW REVEALS.

Times to Light Lamps.

Nov. 30th	.. ..	4.24 p.m.
Dec. 2nd	.. ..	4.23 „
„ 4th	.. ..	4.22 „
„ 6th	.. ..	4.21 „

One number plate must be illuminated as above *vide* Road Vehicles (Registration and Licensing) Order (1921). According to the Lights on Vehicles Regulations (1905) the lamps ordinarily required by law may be lit half an hour later.

Special Articles Next Week.

Next week's issue of *The Motor Cycle* will contain articles criticising the exhibits at this week's record Motor Cycle Show.

Of Interest to L.-E. Competitors.

The new Muskham Bridge, on the Great North Road near Newark, erected at a cost of £50,000, was formally opened by H.G. The Duke of Portland last Friday.

***Not* a Complete Review.**

At least one daily paper's review of the Motor Cycle Show consisted of a reference only to those motor cycles and accessories which were advertised in its issue.

Records on the Eve of the Show.

Last week no less than forty-nine new records were set up on Brooklands track. Details appear in another section of this issue. The track is now closed for its customary winter repairs.

A Sicilian Car Race.

The Autocar of to-morrow's date will contain an interesting narrative of the Coppa Floriso Race held in Sicily last week. A sleeve-valve engined car proved successful.

Cheaper Petrol.

Aviation and No. 1 petrol sells freely in the North London district at 1s. 9d. per gallon. It is said that the spirit is the product of the "non-combine" companies and is up to the standards named in quality. We have tried it on several occasions and could find no difference.

T.T. Dates Fixed.

It has been decided by the Isle of Man authorities that the following dates shall be granted for the 1923 T.T. races: Monday, June 11th, Junior Race; Wednesday, June 13th, Lightweight Race in the morning and Sidecar Race in the afternoon; Friday, June 15th, Senior Race.

Cycle Car Race in Belgium.

The Belgian Motor Cyclists' Federation has decided to organise a Cycle Car Grand Prix in Belgium on July 17th, 1923, to follow the Motor Cycle Grand Prix. This date will be confirmed at the F.I.C.M. meeting in London on December 4th. Information can be obtained from the Federation Motocycliste de Belgique, 63, rue de la Regence, Brussels, Belgium.

"Prophets without Honour."

Only one firm at the Show appears to have adopted the A.C.U. rating of horse-power (1 h.p. per 100 c.c.) down to the second decimal place, and that firm is American.

The Discovery of the Show.

According to a daily paper, a feature of the big Blackburne taxi outfit is "wheel drive." Truly an improvement on the articulated legs on which the ordinary motor cycle runs.

More "Child's Guide to Motor cycling."

Recently we represented the sounds whereby various types of motor cycles could be recognised. Here is the sound that L——'s new two-stroke made after he had "overhauled" it: ——

Indian Examination for Driving Licences.

The United Provinces impose a test on applicants for driving licences, the Superintendent of Police being the registering authority in each district. "The system," writes a Superintendent of Police, "has two drawbacks—one that there is no prescribed test, and consequently the tests vary according to the individual ideas of each superintendent (and often according to the state of his liver); the other that a person tested on a motor cycle receives a licence which also permits him to drive a motor car, and *vice versa*. That the system is useful is illustrated by the fact that I recently tested an Indian who affirmed that he was a good driver. In attempting to turn a very simple corner in reverse, however, he twice ran his car into a brick culvert."

The Scottish Show.

At the Scottish Motor Cycle Show, which will be held in Edinburgh from January 26th to February 3rd, there will be nineteen stands devoted to motor cycles.

The Prejudiced Press.

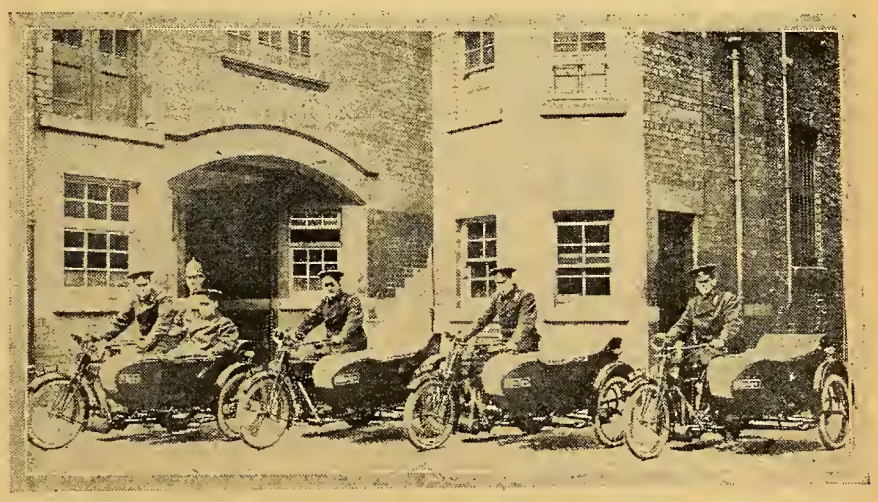
An omnibus, swerving out to overtake another, ran into a motor cyclist, fatally injuring his pillion passenger. The inquest verdict was manslaughter against the 'bus driver, but the Sunday newspaper heading was "The Deadly Pillion," not, as a reader suggests, "The Deadly Omnibus."

Wonderful Oil Consumption.

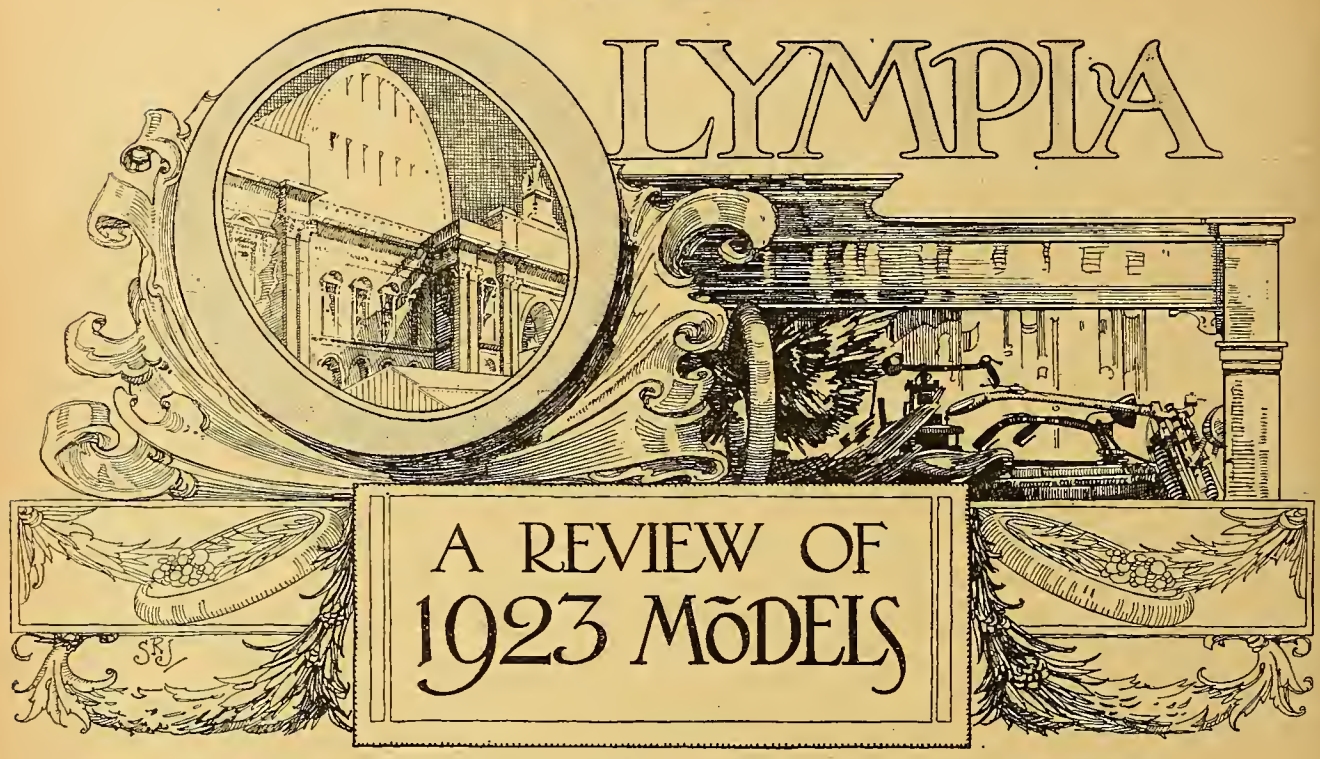
As the result of an official test of Wakefield oil under A.C.U. observation, a 247 c.c. Levis succeeded in attaining an oil consumption of 32.777 m.p.g. on Brooklands track. The distance covered was 161 miles at an average speed of 19.93 m.p.h. One ounce of Castrol C summer grade oil was added to two gallons of B.P. aviation spirit, the consumption of the mixture being 161.1 m.p.g.

M.C.C. Events for 1923.

The Motor Cycling Club has settled on its 1923 fixture list in good time. The following are the most important dates:—March 17th, Opening run to Brighton; April 30th-31st, London-Land's End trial; May 18th-19th, London-Edinburgh run; June 23rd, Inter-Club Team Trial for *The Motor Cycle* Cup; July 7th, Brooklands Meeting; September 29th, One-day sporting solo trial; December 26th-27th, London-Exeter-London trial.



MOTORISED POLICE. It is becoming common in large towns to maintain a squad of police motor cyclists. The four Rudge sidecar outfits are part of the fleet used by the Liverpool force.



STAND-TO-STAND DESCRIPTION OF MOTOR CYCLES, SIDECARS, AND THREE-WHEELERS ON VIEW AT OLYMPIA (Nov. 25th to Dec. 2nd).

The reports and illustrations have been prepared by the staff of "The Motor Cycle" after personal examination of the Exhibits.

A.J.S. (67.)

Overhead Valve T.T. Model.

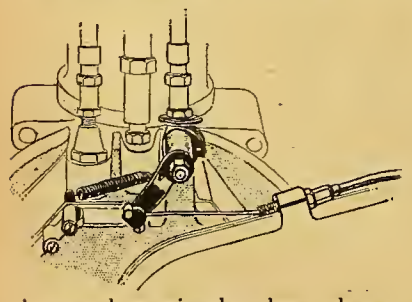
2¾ H.P. MODEL.—74×81 mm. (349 c.c.); single cyl. four-stroke; overhead valves; drip feed lubrication; Amac carb.; chain-driven mag.; 3-speed gear; clutch, no kick-starter; chain drive; 650×65 mm. tyres. Price £87.

A. J. STEVENS AND CO., (1919), LTD., Wolverhampton.—By reason of its performances in the T.T. Races, great interest will be shown in the 349 c.c. overhead valve Tourist Trophy type A.J.S., which is a direct development from the famous racing machines, and is attractive because few makes have attained such consistent success with their speed models. The T.T. machine is in the centre of the stand, and, of course, is show finished, but the bright nickel and special enamelling do not hide the fact that it is essentially a speed model. Even to look at the little machine gives one the idea that its balance for riding purposes should be exceptional.

The side-valve 349 c.c. machines are represented, but are little different from their predecessors.

7 H.P. MODEL.—74×93 mm. (799 c.c.); V twin-cyl. four-stroke; side valves; hand pump lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 700×80 tyres. Price, with Sidecar, £152 10s.

In addition there are, of course, specimens of the 799 c.c. sidecar outfits, one in particular being a two-seater sidecar with a neat little windscreen, a proper cape hood, and excellent upholstery.

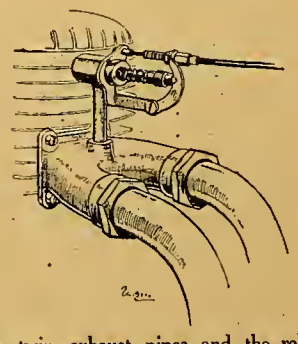


An external cam raises the exhaust valve on the A.J.S.

MODERN TENDENCIES.

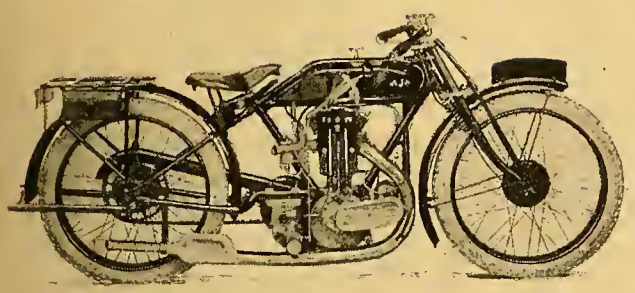
DEFINITE progress in design is discernible in every type of Motor Cycle for 1923. The article "What the Show Reveals" (pages 795 to 803), reviews these improvements in detail. Further to assist readers who are visiting Olympia to assimilate the main items of interest, the outstanding features are summarised below:

(1) Increased number of ultra lightweight motor cycles.
(2) 350 c.c. motor cycles growing in popularity.
(3) Additions to the 500 c.c. range.
(4) Improved saddle tanks concealing the top tube.
(5) Almost general adoption of chain drive.
(6) The vogue of the sporting model.
(7) Better protection from the elements for the rider.
(8) Engine-gear unit construction.
(9) Exceptional value for money in both solo and sidecar machines.
(10) Improvements in electric lighting sets.

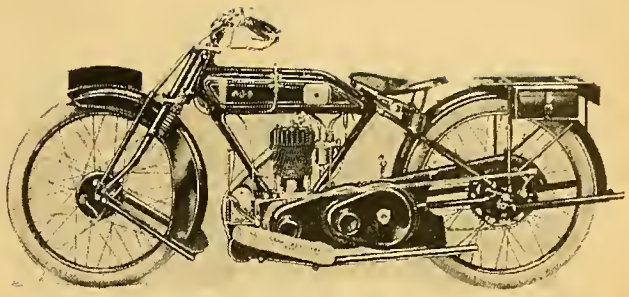


The twin exhaust pipes and the release valve of the Alecto.

The Olympia Show.—



An attraction of the A.J.S. range—the 349 c.c. o.h.v. model.



Conventional and thoroughly tried—the 349 c.c. side valve touring model A.J.S.

The machine itself is of the solid and reliable type with which the A.J.S. made their name, has the electric light controls on the tank side as usual, and a very large expanding brake of car type for the front wheel.

Magdyno equipment is standardised and included in the list price.

AJAX. (157.)

Miniature Two-speed Model.

1½ H.P. MODEL.—55×62 mm. (147 c.c.); single cyl. two-stroke; petroil lubrication; Amac carb.; flywheel mag.; 2-sp. gear; no clutch or kick-starter; chain and belt drive; 26×1¾in. tyres. Price £26 5s.

AJAX MOTOR MANUFACTURERS, LTD., Arthur Street, Birmingham.—A newcomer to the motor cycle world, the Ajax Junior is one of the cheapest lightweights in the Show. The makers claim that it is in no sense a cycle, but a motor cycle; we should say that it is a step between the two, for the tyres fitted are not much larger than those used on pedal cycles. Fitted with a simple type of spring fork, the Ajax Junior is, however, a machine which will appeal to those who require a two-speed miniature to supplant the pedal cycle.

2½ H.P. MODEL.—70×70 mm. (269 c.c.); single cyl. two-stroke; drip feed lubrication; Amac carb.; flywheel mag.; 2-sp. gear; clutch and kick-starter; chain-cum-belt drive; 26×2¼in. tyres. Price £47 10s.

Following conventional lines, with a sloping top tube, the larger two-stroke model employs a Saxon fork and other well-known components. A similar model, but having a 348 c.c. Blackburne engine and Maplestone fork, is shown with two-speed gear, clutch and kick-starter at £62. For an extra £3, a three-speed gear can be fitted.

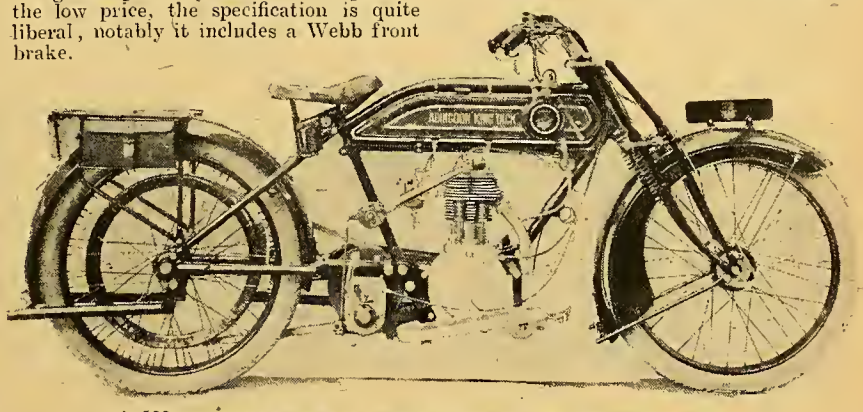
ABINGDON. (127.)

Low Prices and Sound Material.

3½ H.P. MODEL.—85×88 mm. (499 c.c.); single cyl. four-stroke; side valves; drip lubrication; B. and B., Amac, or Senspray carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain and belt drive; 26×2½in. tyres. Price £67 10s.

ABINGDON WORKS, LTD., Tyseley, Birmingham.—The 499 c.c. Abingdon must rank as one of the cheapest machines of its power in the Show. It is fitted with the firm's own engine, distinguished by beautiful workmanship, the castings being exceptionally clean. In spite of the low price, the specification is quite liberal, notably it includes a Webb front brake.

6-7 H.P. MODEL.—73×95 mm. (795 c.c.); V twin cyl. four-stroke; side valves; drip feed lubrication; B. and B., Amac, or Senspray carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 28×3in. tyres. Price £95.



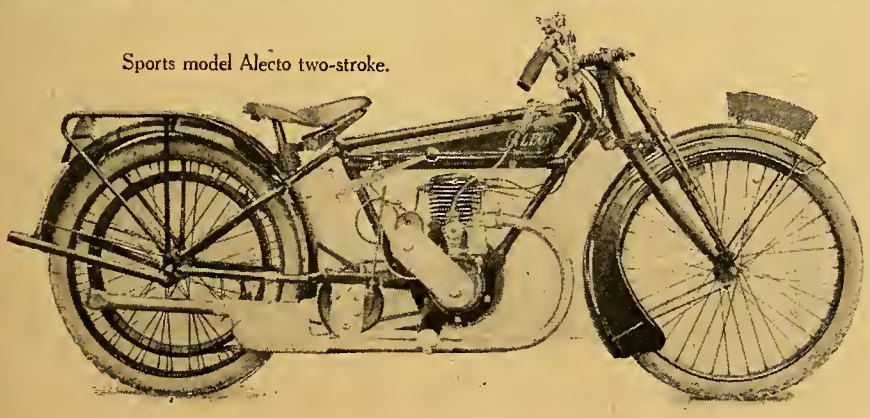
A 500 c.c. single bearing a well-known name—the Abingdon King Dick.

4¼ H.P. MODEL.—85×110 mm. (624 c.c.); single cyl. four-stroke; side valves; drip lubrication; B. and B., Amac, or Senspray carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 28×3in. tyres. Price £85.

The 624 c.c. model is of the heavy-duty type with exceptionally large bearings and is designed to pull a heavy load for prolonged periods without needing replacements. Both engine and gear box are of the firm's own manufacture, the workmanship throughout being characteristically good. Details worth attention are the neat method of oiling the primary chain, the detachable and interchangeable wheels, and the hinged rear mudguard.

The 795 c.c. twin closely resembles the 624 c.c. model in general specification and quality. It should be noted that both the 498 c.c. and 774 c.c. machines have 28 × 3in. tyres, which must minister appreciably to the driver's comfort.

Sports model Alecto two-stroke.



AIROLITE. (20.)

A Very Miniature Sidecar.

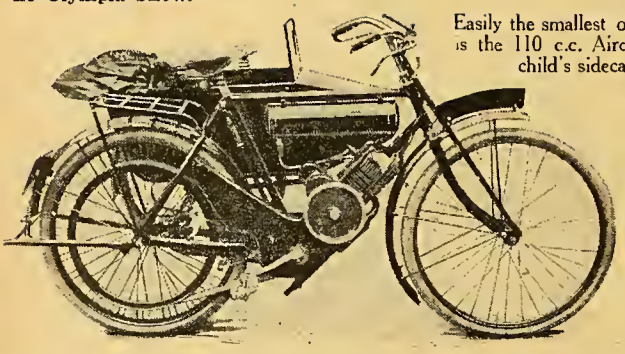
1½ H.P. MODEL.—52×52 mm. (110 c.c.); single cyl. two-stroke; petroil lubrication; Amac carburetter; chain-driven mag.; single-speed gear; no clutch or kick-starter; chain and belt drive; 28×1¾in. tyres. Price: Solo, £27/6; with sidecar, £33/12.

SMALL ENGINES CO., 131, Coventry Road, Birmingham.—By the standards applied when considering a bigger machine, the Airolite motorised bicycle is not so attractive to look upon, but examination reveals that it is quite a workmanlike job.

The engine is a Simplex two-stroke which has a ball-bearing mainshaft. The countershaft is also mounted on ball bearings.

Simple spring forks have been incorporated as standard since the machine was introduced last spring, but otherwise it remains perhaps more like a pedal cycle

The Olympia Show.—



Easily the smallest outfit in the Show is the 110 c.c. Airolite, which has a child's sidecar attachment.

than any other miniature in the building. An open frame lady's model is also on view, which, except for a necessary change in the shape of the tank and the addition of what in pedal cycle phraseology is called a gear case over the pedalling chain, is a replica of the other.

The reader is advised to brace himself up at this point, for—an Airolite sidecar outfit is shown! But it is not so bad as it appears, for the sidecar, although fitted with a hood and windscreen, is only intended for a child up to ten years of age.

AMERICAN X

Handsome American Twin.

7·9 H.P. MODEL.—84.5×88.9 mm. (999.5 c.c.); V twin-cyl.; four-stroke; overhead inlet valves; mechanical lubrication; Schebler carb.; gear-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 27×3½in. tyres. Price: Solo, £105; with Sidecar, £130 5s. Melchior, Armstrong and Dessau, Ltd., 15, Newman Street, London, W.1

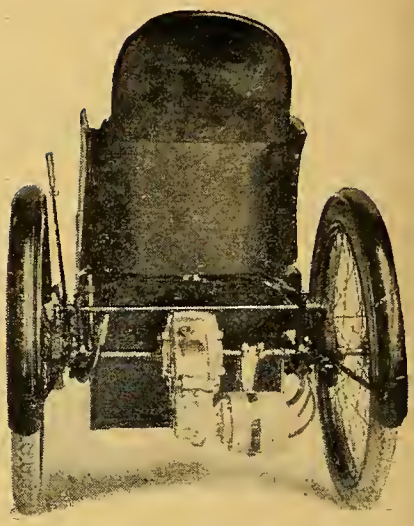
The American X remains entirely unaltered from last year. Following typical American practice in all its details, it must rank as one of the handsomest machines coming to us from across the Atlantic; for it is finished on English lines in black enamel, picked out with narrow gold lining. The electric installation is very neatly carried out.

ARGSON. (32.)

Help for the Disabled.

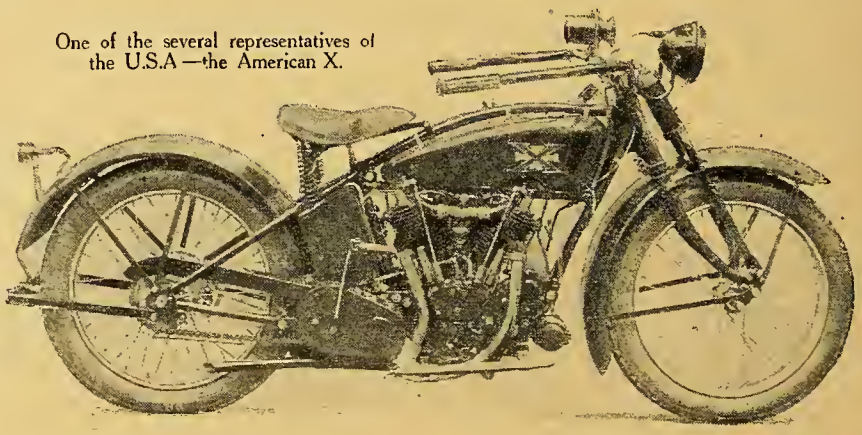
1¾ H.P. MODEL.—60×60 mm. (170 c.c.); single cyl. two-stroke; petroil lubrication; Mills carb.; flywheel mag.; single speed gear; gear drive; 26×2in. tyres (rear wheels). Price £85.

ARGSON ENG. CO., LTD., Richmond Rd., E. Twickenham, Middlesex.—Consisting of an invalid carriage adapted to take a two-stroke engine instead of being propelled by hand, the Argson is not likely to appeal to the average visitor to the Show, but nevertheless has, unhappily, a very definite place in the present-day scheme of things. The hand propel-



Battery-operated electric motor-driven Argson invalid carriage.

One of the several representatives of the U.S.A.—the American X.



INDEX TO OLYMPIA EXHIBITS.

Descriptions of the various 1923 model motor cycles, sidecars, and runabouts at Olympia will be found on pages indexed below.

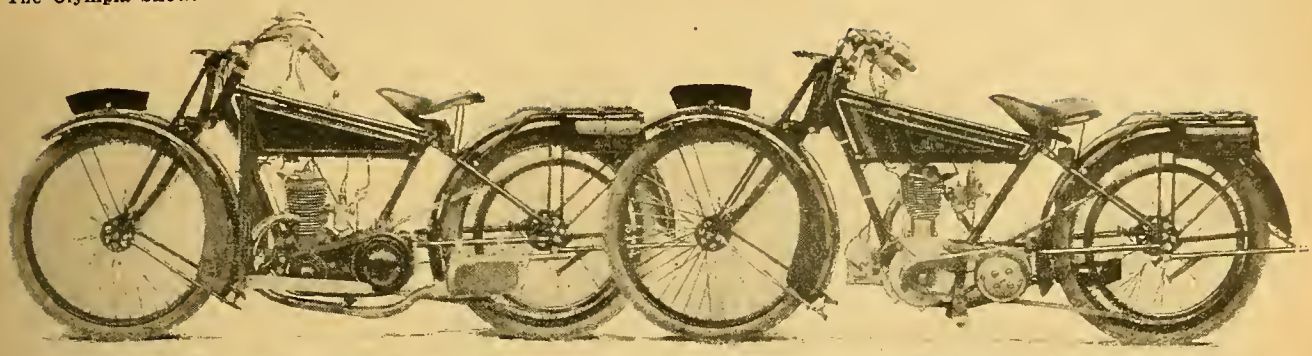
The Olympia Show.—



Improved version of the 292 c.c. touring Allon two-stroke.

New four-stroke Allon with 346 c.c. J.A.P. engine and semi-sporting equipment.

ling gear is retained, and serves for starting up. Located at the rear, the engine, which is made by the Argson Company, is quite an excellent little design employing a roller bearing big-end. Its crankshaft extends through an enclosed gear reduction case to carry a Villiers flywheel magneto, which, of course, may be used to supply lighting current if required. No clutch, in the proper sense of the word, is provided, but it is possible to disengage the gears by a lever operation from the driving seat. Carburetter and sparking plug are also accessible to the driver. Two external contracting band brakes are operated simultaneously by one long lever.

Speeds from 4 to 25 m.p.h. are claimed. Also shown is an electric tricycle, from which, it may be noted, a maximum speed of only 6 m.p.h. is obtained, owing to the necessity of conserving current.

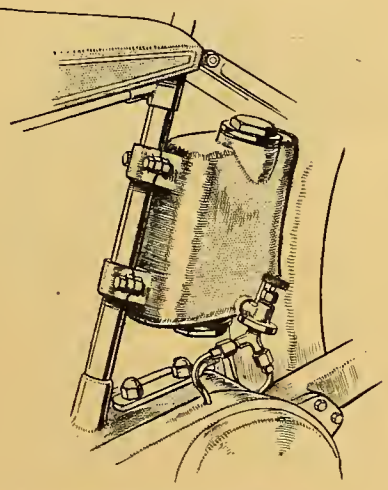
ALLON. (73.)

Four-stroke Model Introduced.

2¾ H.P. MODEL.—70×76 mm. (292 c.c.); single cyl. two-stroke; drip feed lubrication; Amac carb.; flywheel mag.; 2-sp. gear; clutch and kick-starter; chain and belt drive; 26×2¼in. tyres. Price: Solo, £59 17s.; with Sidecar, £75 12s.

ALLDAYS AND ONIONS, LTD., Birmingham.—Both the 292 c.c. two-stroke and the 346 c.c. J.A.P.-engined four-stroke machines are shown, both as solo and as sidecar outfits. The two-stroke has not been altered much from the design with which the Allon made its name, and is a neat and workmanlike job, substantially built and with plenty of protection from bad weather. The touring machine, in particular, is provided with very ample mudguards. The four-stroke is on much the same lines, with a well dropped top tube, sloping tank, and low seating position. Either chain and belt or all-chain drive can be fitted, as desired, and a choice of carburetters is given, either Amac or B. and B. being specified in accordance with the requirements of the rider. In cases where an electric head lamp is used, the current is derived from the flywheel magneto when the machine is running and a dry battery when standing. The latter is carried by the headlamp bracket.

The use of a proprietary four-stroke engine is an innovation on the Allon machines, as are the proprietary gear boxes.



Verus cast aluminium oil tank with drip feed to chains.

ALECTO. (25.)

A Speedy Two-stroke Revived.

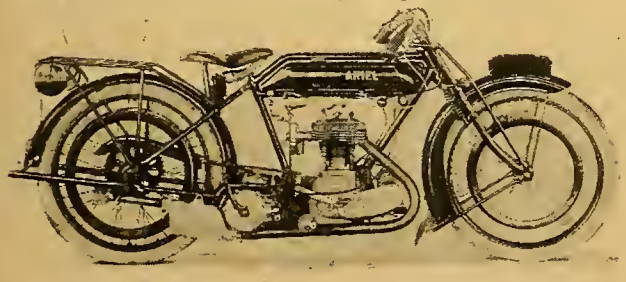
3½ H.P. MODEL.—76×76 mm. (345 c.c.); single cyl. two-stroke; drip feed lubrication; Amac carb.; chain-driven mag.; 2-sp. gear; clutch and kick-starter; chain drive; 26×2¼in. tyres. Price £65.

WHITMEE ENG. CO., Grove Road, Balham, London, S.W.—One of the first two-stroke machines to demonstrate its capabilities on the track by establishing long-distance records was the Alecto. Although this feat has almost been forgotten nowadays, and for some time the machine was in danger of being discontinued owing to external causes, the reappearance of the Alecto at Olympia brings back old memories.

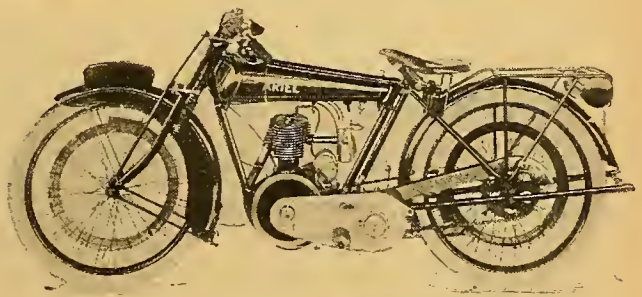
Speed is still a characteristic of the machine, and a belt-driven sports model, differing only in gear and transmission from the model specified above, is said to be capable of 50 m.p.h. in delivery tune. It is priced at £58.

The same engine is fitted to all three machines on show, which are respectively of the sports, touring, and sidecar types. It has an aluminium piston, floating gudgeon pin, plain big end bearing, and drilled connecting rod, and the oil-ways, as indicated on the sectioned engine, are worthy of inspection. The main shaft is supported on double race ball bearings. Silencing has been much improved, a large detachable aluminium expansion chamber being slung from the rear chain stay. Of course, one of the best-known features of the Alecto is its forked exhaust pipe to avoid the front down tube.

A final belt-drive touring model costs £60, and a three-speed chain-driven sidecar outfit £90.



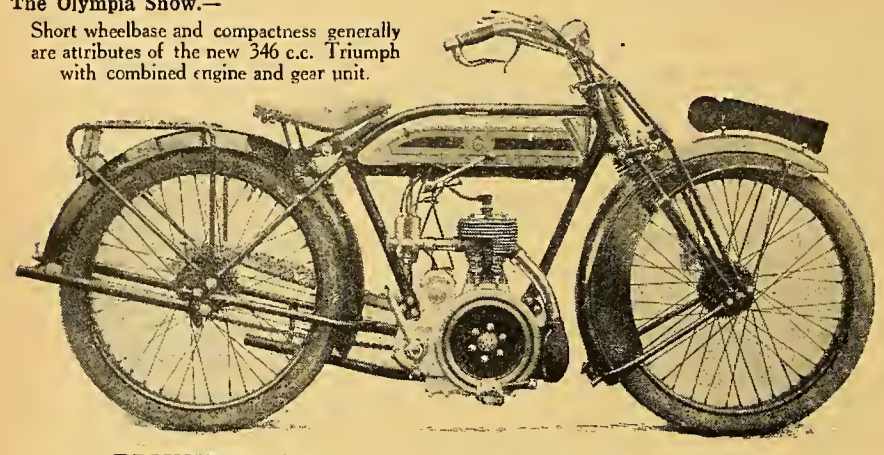
The new 498 c.c. sports Ariel has chain drive and improved silencing arrangements.



Lightweight Ariel with a 249 c.c. Blackburne engine fitted in a loop frame.

The Olympia Show.—

Short wheelbase and compactness generally are attributes of the new 346 c.c. Triumph with combined engine and gear unit.



TRIUMPH. (128.)

All Electrically Equipped.

2¾ H.P. MODEL.—72×85 mm. (346 c.c.); single cyl. four-stroke; side valves; mechanical lubrication, Triumph carb.; gear-driven mag.; 3-sp. gear; clutch and kick-starter; gear and chain drive; 26×2½in. tyres. Price: Solo, not fixed.

TRIUMPH CYCLE CO., LTD., Priory Street, Coventry. —The new Triumph lightweight is slightly overshadowed by the heavy price reductions of its sister models and by the new Triumph policy of standardising electric lamps and hooters on all their machines; but it nevertheless stands out as one of the attractions of the Show. Engine and gear box form a unit with a capacious sump from which a plunger pump delivers oil under pressure to the crankshaft, timing gears, and lay-shaft of the gear box. There are no chains in the unit. The front wheel is a new departure for this firm, as it embodies an expanding brake, the drum of which carries the speedometer drive. This machine will not be available for delivery till April, and has not yet been priced.

2½ H.P. MODEL.—67.35×70 mm. (249 c.c.); single cyl. two-stroke; petroil lubrication; Triumph carb.; chain-driven mag.; 2-speed gear; clutch and kick-starter; chain-belt drive; 24×2½in. tyres. Price: Solo, £52 10s.

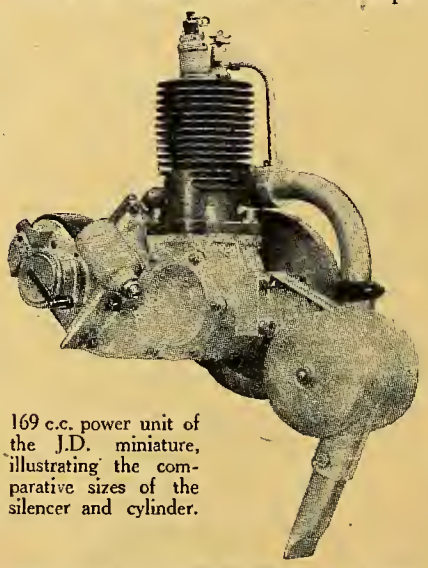
This model now has an engine of larger capacity, and the exhaust system has been redesigned in the interests of silence and neat appearance. A clutch is now incorporated with the gear box, a kick-starter is fitted, and large aluminium legshields are standardised. Lucas electrical equipment is included in the price.

3½ H.P. MODEL.—80.94×97 mm. (499 c.c.); single cyl. four-stroke; o.h.v. (4) valves; band pump lubrication; Triumph carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×3in. tyres. Price: Solo, £96 10s.; with Sidecar, £125 12s. 6d.

This favourite sports machine has required no substantial alteration, but the sparking plug has been moved to the side of the cylinder head, where it is now perfectly accessible, and the twin exhaust pipes sweep forward in an easier curve to clear the Magdyno. The price reduction is most marked, seeing that full electric lighting and a bulb hooter are included in the new figure.

4 H.P. MODEL.—85×97 mm. (550 c.c.); single cyl. four-stroke; side valves; band pump lubrication; Triumph carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×3in. tyres. Price: Solo, £93 10s.; with Sidecar, £121 2s. 6d.

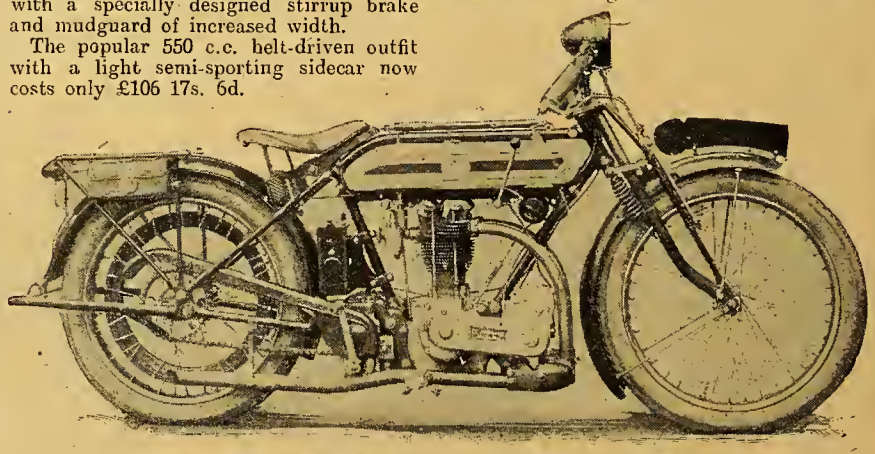
Like the o.h.v. and the chain and belt models, the all-chain Triumph has undergone no material alterations. A Magdyno lighting set and electric horn are included in the catalogue price, a very neat mounting for the battery case being provided behind the saddle tube. The Triumph-



169 c.c. power unit of the J.D. miniature, illustrating the comparative sizes of the silencer and cylinder.

Druid fork is now employed on this model with a specially designed stirrup brake and mudguard of increased width.

The popular 550 c.c. belt-driven outfit with a light semi-sporting sidecar now costs only £106 17s. 6d.



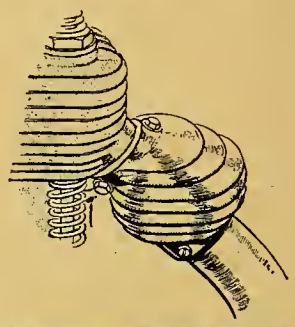
Speed, comfort and full equipment mark the 499 c.c. o.h.v. Triumph.

BEARDMORE-PRECISION. (109.)

Pressed Steel Construction.

2¾ H.P. MODEL.—70×90 mm. (346 c.c.); single cyl. four-stroke; side valves; drip feed lubrication; B. and B. carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2¼in. tyres. Price: Solo, £57 10s.; with Sidecar, £72 10s.

F. E. BAKER, LTD., King's Norton, Birmingham.—Ever since their introduction, the post-war Beardmore-Precision machines have been characterised by two special features differentiating them from most other makes, namely, pressed steel frame construction and the use of leaf spring forks. The latest addition to the range is a 346 c.c. medium-weight single-cylinder machine, which is intended to take a light sidecar if desired. This machine is fitted with Sturmey-Archer three-speed gear, and, in general specification, is similar to the larger models shown on this stand. A detail that does not escape the critical

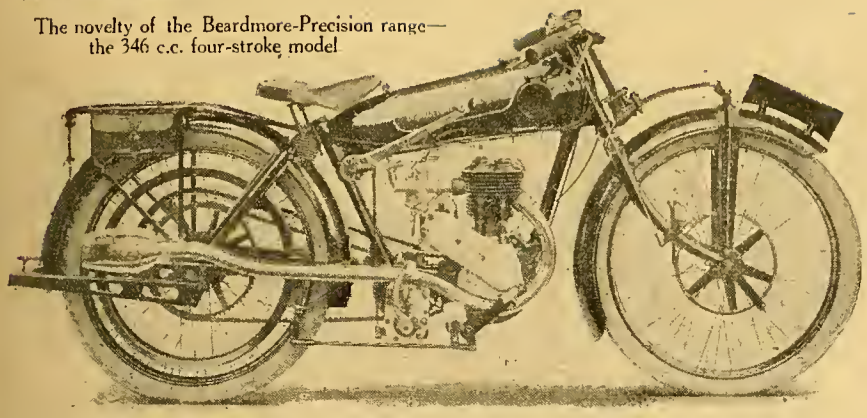


Special fins on the top end of the exhaust pipe of the 496 c.c. sports Beardmore.

eye is the fitting of a petrol filter immediately under the tank between the petrol pipe and the tank, and the latter, it will be recollected in these machines, forms part of, and lends its strength to, the frame, as does also the rear mudguard. The stand and carrier are also formed of steel channel instead of the more usual brazed tubing. The large and freely curving exhaust pipe and adequate silencer are noteworthy features of all models. A machine is also shown with 349 c.c. Barr and Stroud sleeve valve engine.

The Olympia Show.—

The novelty of the Beardmore-Precision range—the 346 c.c. four-stroke model



3½ H.P. MODEL.—81.1×96 mm. (496 c.c.); single cyl. four-stroke; side valves; mechanical lubrication; B. and B. or Amac carburetter; chain-driven magneto; Sturmey-Archer 3-sp. gear; clutch and kick-starter; all-chain drive; 700×80 mm. tyres. Price: Solo, £70.

Noteworthy features of the bigger Beardmore-Precision machines are the unit construction of engine and gear box, the Sturmey-Archer three-speed gear being incorporated in the crank case, the automatic lubrication system, all oil being contained in a sump the front part of which is ribbed for cooling, and the deeply-ribbed aluminium casting interposed between the cylinder and the exhaust pipe on the 496 c.c. model. The 496 c.c. model specified above is of the sports solo type, and the front forks are on the parallel link principle, but have the Beardmore leaf springing.

4¼ H.P. MODEL.—89×96 mm. (598 c.c.); single cyl. four-stroke; side valves; mechanical lubrication; B. and B. or Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 700×80 mm. tyres. Price: Solo, £80; with Sidecar, £105.

The big single model follows closely the lines of the sports model just described, but naturally heavier equipment, footboards, and leg guards are included. On one example a two-seater sidecar is shown.

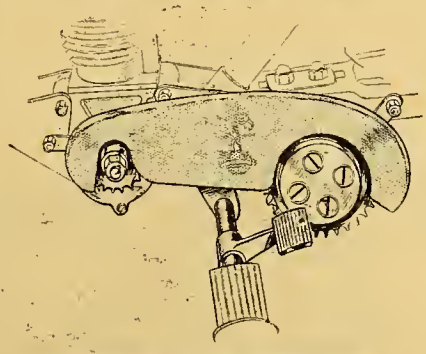
Spring-frame models are also available.

EXCELSIOR. (98.)

For Solo and Passenger Service.

1½ H.P. MODEL.—55×62 mm. (147 c.c.); single cyl. two-stroke; petroil lubrication; Mills carb.; flywheel mag.; 2-sp. gear; no clutch or kick-starter; chain-cum-belt drive; 24×2in. tyres. Price: £28 10s.

BAYLISS, THOMAS AND CO., King's Road, Tyseley, Birmingham.—A range of models varying from the miniature Villiers-engined lightweight of 147 c.c. up to a large and substantial 976 c.c. J.A.P.-engined sidecar outfit, is shown on the Excelsior stand. The smallest of these machines will attract great interest, not only on account of its sound practical construction, but also by reason of

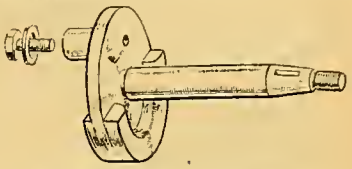


Neat chain guard on the smallest Excelsior model.

the very attractive price at which it is now offered to the public. It is a genuine lightweight, and offers also the advantage of the well-known Albion two-speed countershaft gear, which is incorporated with chain-cum-belt transmission.

8 H.P. MODEL.—85.5×85 mm. (976 c.c.); V twin cyl. four-stroke; side valves; drip feed lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive. Price with Sidecar, £123.

Internal expanding brakes, front and rear, and the Burman three-speed gear are provided on the large sidecar machine. Provision is made for taking up the shocks of transmission, both in the countershaft and in the rear chain sprocket. The mudguards are of large dimensions, and a neat tool chest is incorporated behind the saddle.



Overhung crankshaft of the new ultra-lightweight Omega.

HOBART. (101.)

2¾ H.P. MODEL.—70×90 mm. (346 c.c.); single cyl. four-stroke; side valves; sight-feed lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; all-chain drive; 26×2¼in. tyres. Price: Solo, £72.

HOBART CYCLE CO., LTD., Coventry.—Hobart has long been an honoured name in the lightweight world, and although proprietary engines are employed—a J.A.P. in this case and Blackburne in others—they show the result of this specialisation very clearly.

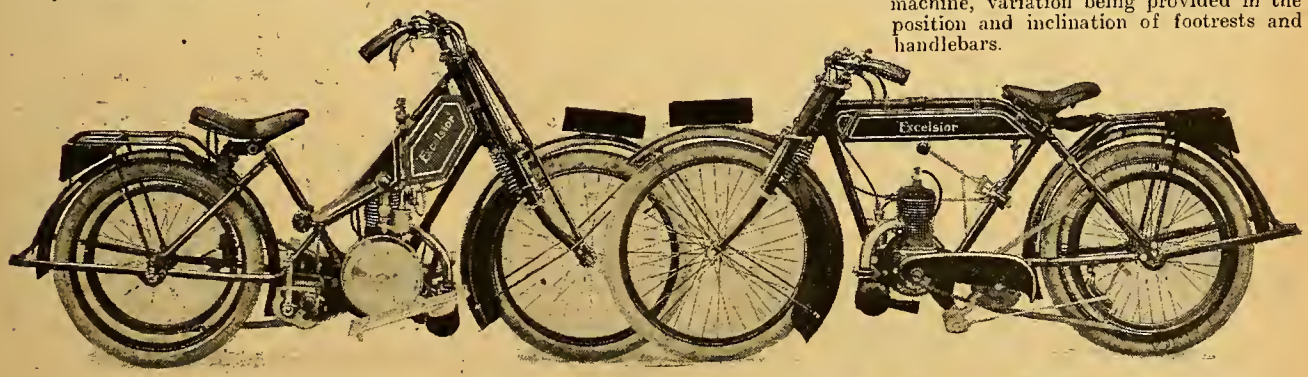
The specified model is a sporting type, and has the super-sports engine.

Other prices for the 250-350 c.c. machines extend upwards from £56.

1¾ H.P. MODEL.—60×60 mm. (170 c.c.); single cyl. two-stroke; petroil lubrication; Amac carb.; chain-driven mag.; 2-sp. gear; clutch, no kick-starter; chain and belt drive; 24×2in. tyres. Price: Solo, £32 18s. 6d.

A welcome addition is the new Hobart Junior with 170 c.c. engine. It is certain to find favour with those who are looking for a neat, practical, and reliable machine that is really light.

A light type of Brampton fork with central tension spring is fitted, and the cylindrical form of the tank gives a most pleasing appearance to the machine, suggesting that a special study has been made of providing the utmost accommodation in the smallest possible space. The Albion two-speed gear box is standardised. The miniature may be obtained either as a sports or a touring machine, variation being provided in the position and inclination of footrests and handlebars.



Open frame Excelsior two-stroke lightweight, suitable for motor cyclists of either sex.

The Bwlch-y-Groes-conquering Excelsior miniature with 147 c.c. Villiers engine

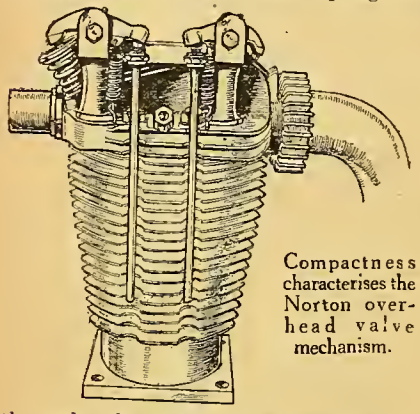
The Olympia Show.—

NORTON. (103.)

High-speed Mounts.

3½ H.P. MODEL.—79×100 mm. (490 c.c.); single cyl. four-stroke; overhead valves; hand pump lubrication; Mills or B. and B. carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter (optional); chain drive; 26×2½in. tyres. Price: Solo, £98.

NORTON MOTORS, LTD., Bracebridge Street, Birmingham.—Chief interest centres round the 490 c.c. overhead-valve-engined Norton, which is the most recent addition to the range of these famous machines. A feature which at once catches the eye is the arrangement of supplementary return movement springs on



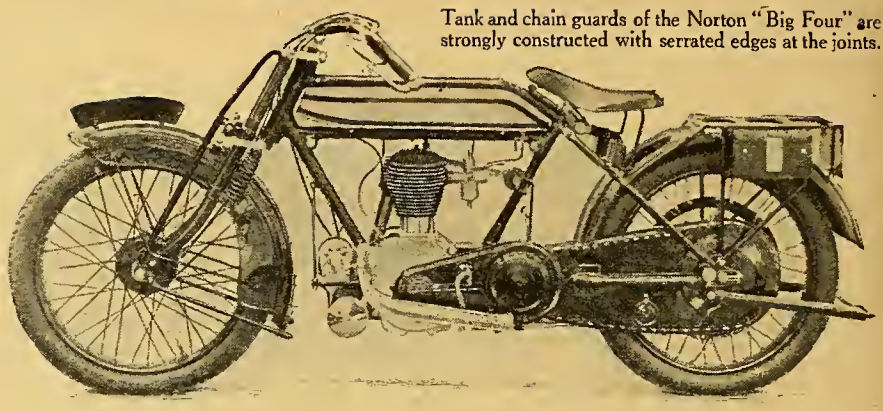
Compactness characterises the Norton overhead valve mechanism.

the push rods. The extra radiating fins at the point where the exhaust pipe leaves the detachable cylinder head are well placed to ensure maximum cooling effect, and the fins on the cylinder barrel itself are brought unusually low down. Practical riders will be impressed by the thorough way in which the brakework has been carried out on all Norton models. An internally-expanding brake is employed on the front wheel in all cases, whilst that on the back wheel takes effect with trailing action on a dummy belt rim.

3½ H.P. MODEL.—79×100 mm. (490 c.c.); single cyl. four-stroke; side valves; hand pump lubrication; Mills or B. and B. carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2½in. tyres. Price: Solo, £79.

No great change has been made to the side-valve Norton, which has always been as fast and powerful as many specially-designed o.h.v. machines.

The direct belt driven model is altered



Tank and chain guards of the Norton "Big Four" are strongly constructed with serrated edges at the joints.

only in price; it is now £60, and is one of the very few direct-driven machines above 350 c.c.

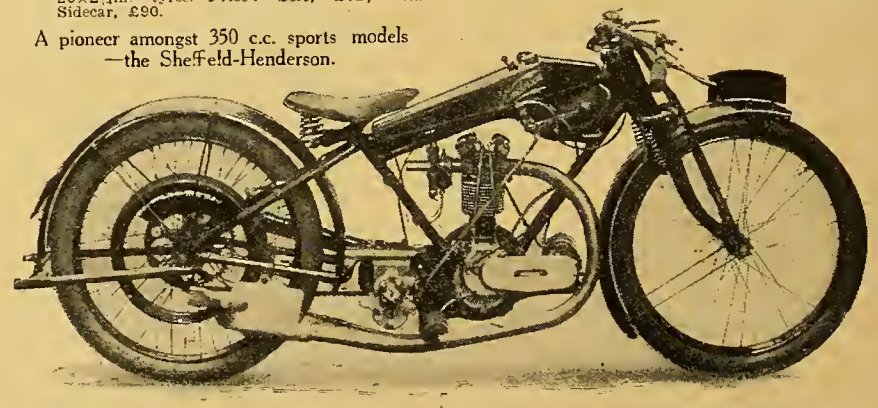
"Big Four" (633 c.c.) touring and tradesman's carrier sidecar outfits complete the exhibit, the machine, solo, costing £84, the sidecars varying according to style. The general finish of these machines, especially the clean exterior of the crank case, is commendable.

SHEFFIELD-HENDERSON. (165.)

With a Speed Reputation.

2¾ H.P. MODEL.—71×88 mm. (348 c.c.); single cyl. four-stroke; side valves; drip feed lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2¼in. tyres. Price: Solo, £72; with Sidecar, £96.

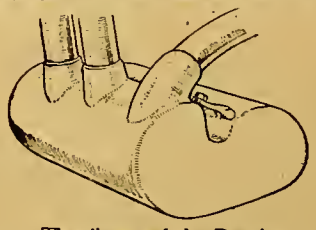
A pioneer amongst 350 c.c. sports models —the Sheffield-Henderson.



HENDERSON MOTORS, LTD., Fitzwilliam Street, Sheffield.—All four of the models on this stand are of the same nominal horse-power and are of the same general lines as regards frame, tanks, and detail. There is, however, a wide difference in the type of engine fitted.

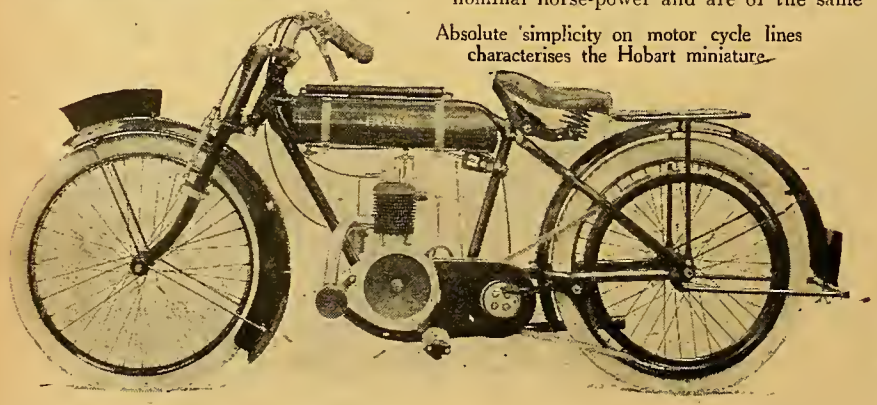
One model, as specified, which has a 348 c.c. Blackburne single-cylinder engine with side valves, is of the touring type with deep mudguards, a carrier, and the fullest of equipment. The next has the overhead valve single-cylinder engine, and the makers claim 70 m.p.h. from the machine as an attraction to those whose sporting instincts favour high speed and dropped bars

The third machine lies midway, having the same engine as the first model, but special cams and aluminium piston and narrow guards. It is of rakish build. As a variation a fourth model is offered with the Bradshaw oil-cooled single-cylinder engine and mechanical lubrication. All of them are shown with



The silencer of the Dunelt.

suitable sidecars attached, but the special overhead valve machine appears also as a solo mount. A somewhat unusual outline is given to all the machines by the presence of the tool kit just below that portion of the tank which contains oil and by the curious shape of the tank itself.



Absolute simplicity on motor cycle lines characterises the Hobart miniature.

Week by Week

—throughout the Year, we have unfolded the tale of the Tyre with NINE lives.

Last week we gave a resume of our chief successes during the season.

When so many famous crack riders continue to rely on **HUTCHINSON** for success and personal safety—it is very evident that they ***know*** from experience that there is NO Better tyre they can choose.

Everywhere the attention of Motor Cyclists is being focussed upon the wonderful records achieved on **HUTCHINSON.**

No wonder so many purchasers of new machines are specifying "The Tyre with Nine Lives." They insist on the tyre that experts have proven—the famous product of the House of **HUTCHINSON,** tyre makers for over half a century.

At it Again!

Herbert Le Vack and J. L. Emerson put up some sensational speed records on **HUTCHINSON** *at Brooklands on Saturday, November 18th, under unfavourable conditions.*

Le Vack achieved three world's records. Class E, standing 10 miles—covered in 6 mins. 26.9 secs. (equivalent to the phenomenal speed of 93.04 m.p.h.). **In the Hour:** 89 miles, 1,591 yds. were completed at a speed of 89.90 m.p.h. 100 Miles covered in 1 hr. 6 mins. 43.4 secs. (Le Vack's speed was greatly increasing towards the end of the 100 miles).

Emerson's Performance: Class E.—100 mile record to 1 hr. 20 mins. 14.22 s. (equivalent to 74.77 m.p.h.).

STAND **9** MOTOR CYCLE SHOW.

Out of 185 existing records at Brooklands—150 are held on **HUTCHINSON.**

STAND **9** MOTOR CYCLE SHOW.

SUPERSTUDDED

HUTCHINSON TYRES

Rubber Manufacturers 1850.
Tyre Manufacturers 1870.

HUTCHINSON TYRES,
70, Basinghall Street, E.C.

THE TYRE WITH NINE LIVES

Two other of PRICE'S preparations equally as good as Huile de Luxe

The following remarks will be of interest to the Motor Cyclist enjoying winter runs on a sound machine suitably protected against the weather, but the cycle parts of his machine require better protection. The hubs, for instance, contain comparatively delicate bearings soon ruined by wet and grit, as has been frequently pointed out in the A.C.U. Judges' Reports. The chains, also, unless completely enclosed and running in oil, must be proofed against showers of mud.

PRICE'S

Hub Lubricant Stiff

frequently commended in the Motor Cycle Press as ideal for filling hubs, is a highly refined pure hydrocarbon, which when rendered fluid by gentle warming, can be readily injected with the usual metal syringe or pump. It fills up the bearings and completely seals the openings against the ingress of wet and grit. One filling remains good for several months. Several Motor Cycle Manufacturers send out their machines with the hubs already packed. It is excellent also, for use in grease cups and for laminated springs, either gaitered or open.

PRICE'S

Rangraphine

used and recommended by the leading chain makers in the Country is an efficient blend of pure graphite with Rangoon Jelly. The former lubricates and prevents the accumulation of grit, whilst the latter is the standard preparation for preservation from rust. Periodically the chains should be cleaned and soaked in melted Rangraphine, which also is best for smearing on the teeth of the chain wheels. Smeared on threads of valve caps and spark plugs, it renders them easily removed yet gas tight.

A tin of each, *i.e.* 2 tins, for 2/- inclusive

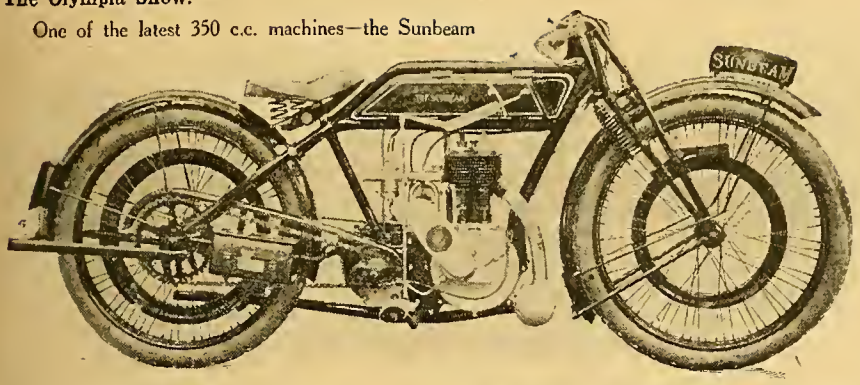
Where any Motor Cyclist has a difficulty in obtaining supplies locally, we will send for 2/- a carriage paid parcel containing a sample half pound tin of each preparation sufficient for several months use and latest lists and useful literature.

PRICE'S PATENT CANDLE COMPANY LIMITED,

Battersea, S.W.11.

The Olympia Show.—

One of the latest 350 c.c. machines—the Sunbeam



SUNBEAM. (110.)

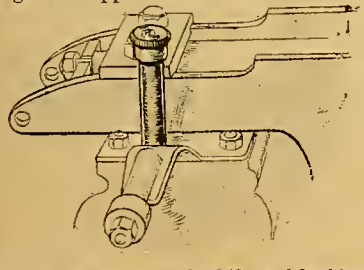
Speedy Side-valve Singles.

2¾ H.P. MODEL.—70×90 mm. (347 c.c.); single cyl. four-stroke; side valves; drip feed lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2⅜in. tyres. Price: Solo, £94 10s.

JOHN MARSTON, LTD., Wolverhampton.—Success in racing and competitions both at home and abroad has been the lot of the Sunbeam last season, and the reasons for these achievements and for the well-deserved popularity that these machines enjoy cannot be gathered from a perusal of the bare specifications of the Sunbeam range. The reasons for the Sunbeam success lie rather in details of design, workmanship and finish, which have been brought to a degree of perfection that must be seen to be fully appreciated. Visitors to the Sunbeam stand have the opportunity of seeing the complete range of these machines, which now caters for all classes. The type that won both the T.T. and the great French race at Strasbourg this year, with long-stroke engine (77×105) is on view; and much interest is also shown in the recently introduced 347 c.c. lightweight, which incorporates all the well-known refinements of the larger models, such as oil-bath chain cases, powerful brakes operating on dummy belt rims both front and rear, and the Sunbeam three-speed gear. Sunbeam enthusiasts and motor cyclists in general will welcome the reappearance of this model in its present advanced form.

3½ H.P. MODEL.—85×88 mm. (499 c.c.); single cyl. four-stroke; side valves; drip-feed lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2½in. tyres. Price: Solo, £110 5s.

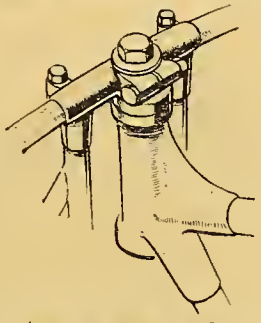
To the rider who desires a fast solo mount with reasonable comfort for serious touring the 499 c.c. "light solo" makes a strong appeal. The sweep of the exhaust pipe on this and the 492 c.c. T.T. sporting model is a distinctive feature in the general appearance of these machines.



Gear box lubricator on the 348 c.c. Matchless

4¼ H.P. MODEL.—85×105 mm. (599 c.c.); single cyl. four-stroke; side valves; drip feed lubrication; Amac carb.; chain-driven mag.; 3-speed gear; clutch and kick-starter; chain drive; 650×65 mm. tyres. Price: Solo, £120 15s.; with Sidecar, £157 10s.

The 599 c.c. sidecar outfit remains for the most part unaltered. The leaf-spring front fork on this and on the 976 c.c. J.A.P.-engined twin cylinder model deserves special notice.



Omega-Jap handle bar fixing.

OMEGA. (140.)

An Attractive Miniature.

1.7 H.P. MODEL.—60×60 mm. (170 c.c.); single-cyl. two-stroke; petroil lubrication; Amac carb.; chain-driven mag.; single gear; no clutch or kick-starter; belt drive; 24×2in. tyres. Price £25.

W. J. GREEN, LTD., Omega Works, Coventry.—The Omega Junior is a very interesting addition to the range of featherweights, and in single-geared form is remarkably cheap, whilst several transmission options are available for those who can afford them. Notable points are the low saddle position (26in. from ground level), the readiness of the engine to two-stroke at low speeds and down hill, the light and original spring fork, and the use of two belt rim brakes on the rear wheel, one being operated by cable from the handle-bars.

3.5 H.P. MODEL 2.—71×88 mm. (348 c.c.); single-cyl. two-stroke; drip feed lubrication; Amac carb.; chain-driven mag.; single gear; no clutch or kick-starter; belt drive; 26×2¼in. tyres. Price: Solo, £38; with Sidecar, £53.

The well-known 348 c.c. two-stroke engine is now obtainable on five different models, of which the sidecar outfit with three-speed gear, chain drive, clutch and kick-starter at £75 is especially attractive. This engine may also be had mounted in the firm's duplex frame, giving unusually good weather protection. Numerous small refinements have been made in the machine; the most ostensible change is the adoption of a huge aluminium silencer.

2.9 H.P. MODEL 5.—70×76 mm. (292 c.c.); single-cyl. four-stroke; side valves; drip lubrication; Amac carb.; chain-drive mag.; 2-sp. gear; clutch and kick-starter; chain drive; 26×2¼in. tyres. Price £63 10s.

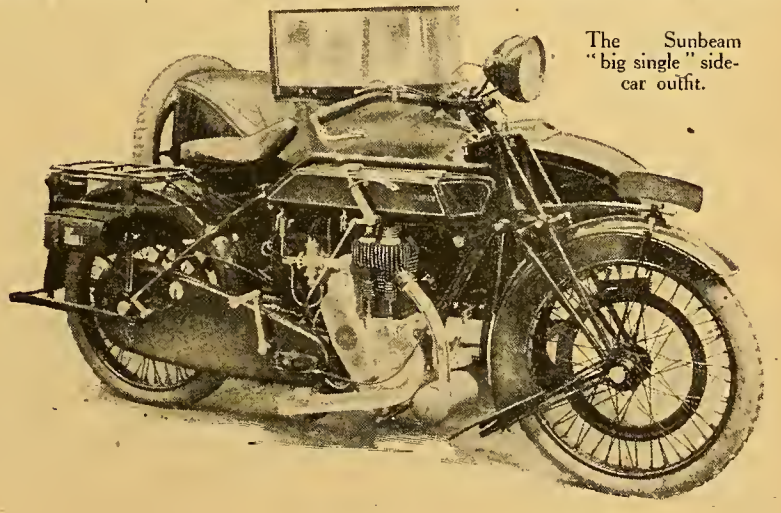
This model has undergone very little change from last year. It now has all-chain drive, an expanding brake in the rear hub, the Omega patent spring fork, and a front belt rim brake instead of the stirrup pattern. Alternative transmissions may be specified.

BRADBURY. (108.)

Three Sturdy Four-strokes.

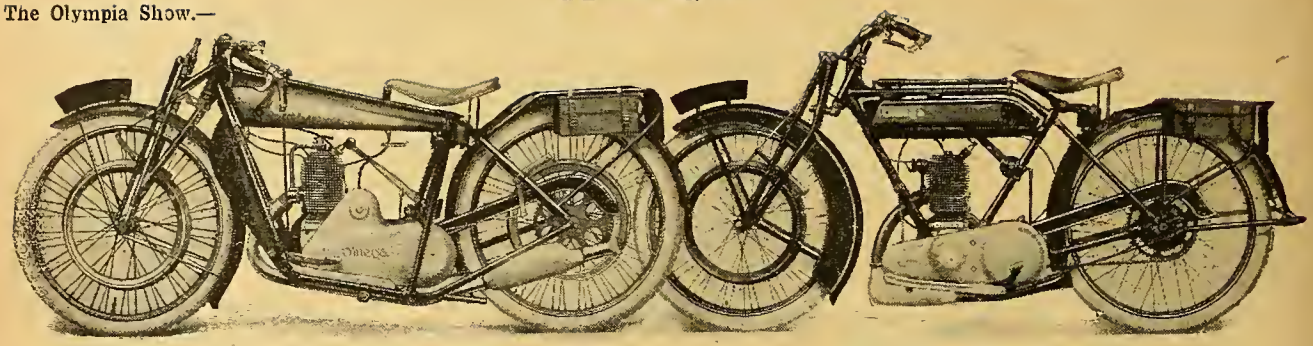
6 H.P. MODEL.—74.5×86 mm. (749.75 c.c.); V twin cyl. four-stroke; side valves; drip feed lubrication; B. and B. carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2½in. tyres. Price: Solo, £95; with Sidecar, £122 8s.

BRADBURY AND CO., LTD., Oldham.—The Bradbury twin (750 c.c.) sports model has quite recently broken records at Brooklands, and this machine deservedly holds pride of place on their stand at Olympia, for its general lines are extremely attractive, and it at once commands the attention of those who are seeking a high-powered mount which shall not at the same time be excessively



The Sunbeam "big single" sidecar outfit.

The Olympia Show.—

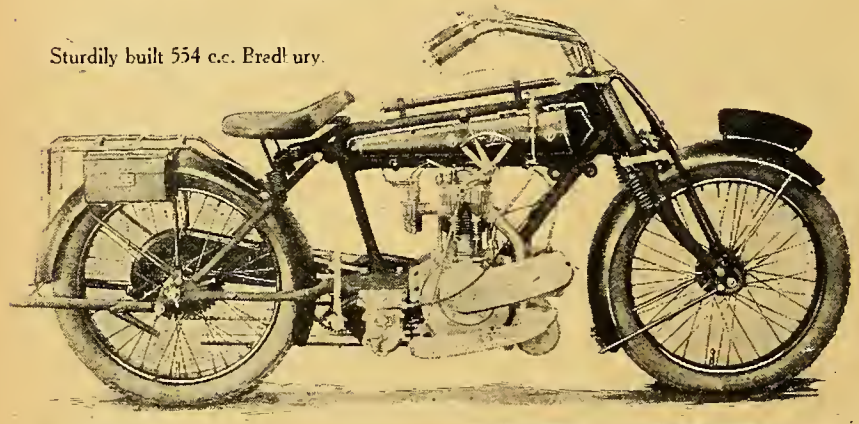


Two examples of the Omega; that on the left has a duplex frame.

neavy. It is difficult to say exactly how the makers have achieved comparative lightness with this model, but a glance followed by a brief test with the hand suffices to show that they have succeeded, and that without sacrificing solidity.

2¾ H.P. MODEL.—74.5×80 mm. (350 c.c.); single cyl. four-stroke; side valves; drip feed lubrication; B. and B. carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; all-chain drive; 26×2⅜in. tyres. Price: Solo, £65.

Sturdily built 554 c.c. Bradbury.



The medium-weight 350 c.c. single-cylinder machine is also an attractive general-purpose mount. It is shown fitted with Moss three-speed gear and all-chain drive, and a feature that will not escape the notice of practical long-distance tourists is that 2⅜in. section tyres are standardised instead of the too common smaller size.

The new 554 c.c. single-cylinder model is similar in general specification to the smaller machine. In all cases internally-expanding brakes are fitted to the front wheel, and Druid front forks are employed. A large silencer is provided so that these machines should run very quietly, and the frames in each case afford a low and comfortable riding position, whilst the centre of gravity is sufficiently well forward to provide easy steering.

HENLEY. (111.)

4¼ H.P. MODEL.—85×96 mm. (545 c.c.); single cyl. four-stroke; side-by-side valves; mechanical lubrication; Amac or B. and B. carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2½in. tyres. Price: Solo, £72 10s.; with Sidecar, £92 10s.

HENLEY ENG. CO., LTD., Steward Works, Doe Street, Birmingham.—There are quite a number of signs of very careful design on the larger Henley that serve to lift it out of the ruck. The neat knee grip fixture (concealed) and the capacious tool box on the carrier will serve as instances of this; and the mechanically-minded will appreciate that such things as frame design are on the same high standard. Burman gear boxes are fitted in every case.

2¾ H.P. MODEL.—71×88 mm. (348 c.c.); single cyl. four-stroke; overhead valves; mechanical lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch, no kick-starter; all-chain drive; 26×2½in. tyres. Price: Solo, £72 10s.

Following the same general lines, but stripped of all unessential fitments, is a nice-looking speed model which is well up to the general high standard of excellence of the many machines in the Show employing the o.h.v. Blackburne engine.

348 and 249 c.c. side valve Blackburne-engined singles are priced at £63 10s and £56 10s. respectively.

IVY. (64.)

New Four-stroke Model.

2¾ H.P. MODEL.—75×79 mm. (349 c.c.); single-cyl. four-stroke; side valves; drip feed lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2¼in tyres. Price: Solo, £70; with Sidecar, £92.

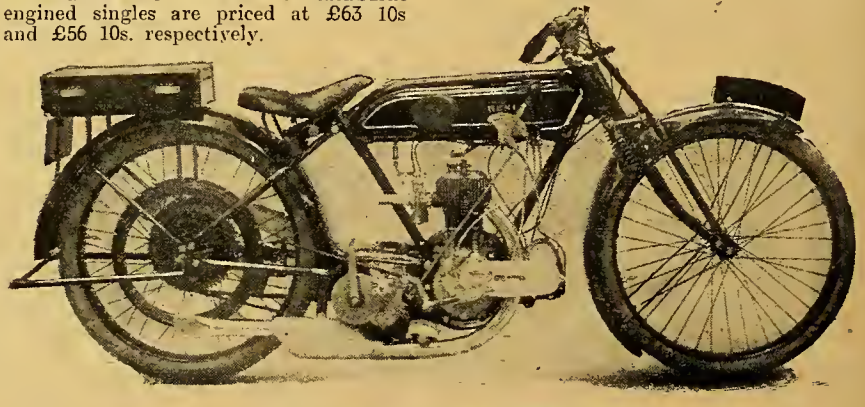
S. A. NEWMAN, LTD., Aston Cross, Birmingham.—The principal feature of the Ivy exhibit is the new side-valve-engined four-stroke, which makes its appearance for the first time. This does not differ radically from the two-stroke-engined models, which are so well-known, and which are shown on the stand in various models. It is a quite clean-looking little machine, arranged in an entirely conventional manner, enamelled the khaki colour which is distinctive of the Ivy machines, and notable for a double down tube from the steering head to the crank case.

Designed in the first place as a comfortable touring machine, it has deep mudguards and extra leg guards for riding in bad weather.

3 H.P. MODEL.—75×79 mm. (349 c.c.); single-cyl. two-stroke; drip feed lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2¼in. tyres. Price: Solo, £65.

The two-strokes have been slightly modified in detail, and are shown mainly as solo mounts, one having the dropped frame suitable for a lady's use, but all of similar design. To one a collapsible sidecar is fitted.

The only real alteration to the smaller (250 c.c.) Ivy lies in a change of plug position, *i.e.* to the rear of the cylinder head.



Chain driven 348 c.c. Henley-Blackburne.

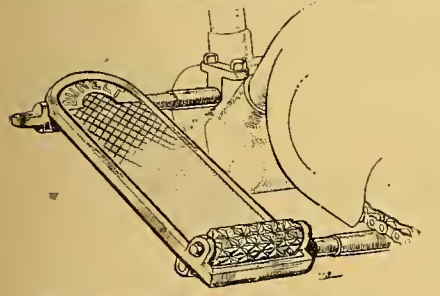
The Olympia Show.—

DUNELT. (166.)

Big Single Two-Strokes.

4 H.P. MODEL.—85×88 mm. (499 c.c.); single cyl. two-stroke; drip-feed lubrication; Amac carb.; chain-driven mag.; 3-speed gear; clutch and kick-starter; chain drive; 26×2½in. tyres. Price: Solo, £75; with Sidecar, £89 10s.

DUNFORD AND ELLIOT (SHEFFIELD), LTD., Bath Street, Birmingham.—The Dunelt is the only big single-cylinder machine which employs a two-stroke engine, and even in the two-stroke world it is distinctive because it has a double diameter piston. The cylinder is placed at an



The Dunelt footplates are slightly splayed and so provide a natural position for the rider's feet.

angle, thus allowing the tank to slope to a lower point at the rear, and also bringing the saddle position lower. One solo machine is shown of touring type with handlebars of black finish, wide mudguards, and the tools in their leather case protected by a metal strengthening box. The other three examples on the stand all have sidecars, and beyond this addition do not differ from the solo mount to any extent. One is shown completely equipped with a celluloid windscreen of large size clipped to the handle-bars, which should be remarkably effective, extra leg guards for the rider, a shield for the sidecar, and a gear-driven speedometer bolted to the handlebars. Two of the sidecar machines, however, have final belt drive, and one has an all-chain transmission; with sidecar it is listed at the very reasonable price of £95.

BROUGH. (60.)

80 m.p.h. 500 c.c. Flat Twin.

496 c.c. MODEL.—70×64.5 mm. (496 c.c.); flat twin four-stroke; overhead valves; mechanical lubrication; Amac carb.; gear-driven mag.; 3-sp. gear; no clutch or kick-starter; chain drive; 26×2½in. tyres. Price £100.

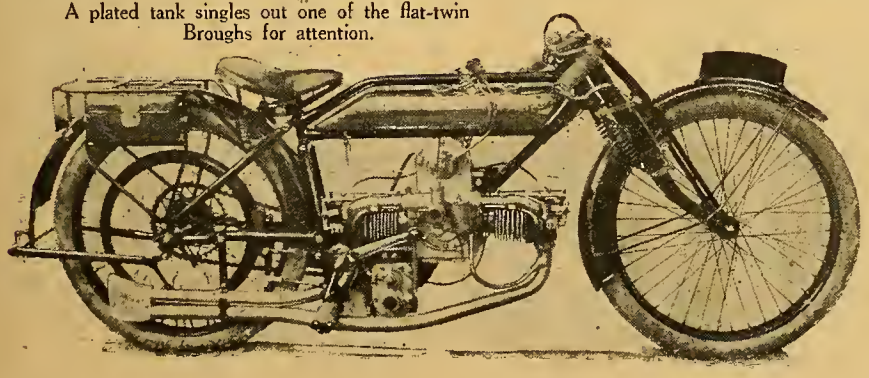
W. E. BROUGH AND CO., Basford, Nottingham.—The centre of attraction on the Brough stand is the 496 c.c. flat twin sports model, which is guaranteed to attain a speed of 70 m.p.h., or, if a slightly increased price be paid for extra attention, 80 m.p.h. The model in question is one of the best-looking machines in the Show, having a nickel-plated tank with rounded corners, and, of course, the long separate exhaust pipes ending in an aluminium fish tail, which all good sporting models should have. This year the cylinder head has been considerably modified, substantial roller bearings are used for the connecting rods, and the aluminium pistons are of the firm's own alloy. The location of the handle-bars, foot-rests, and saddle affords an exceptionally fine riding position with a real sense of control.

692 c.c. MODEL.—70×90 mm. (692 c.c.); twin cyl. four-stroke; side-by-side valves; drip lubrication; Amac carb.; gear-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×3in. tyres. Price: Solo, £90; with Sidecar, £120.

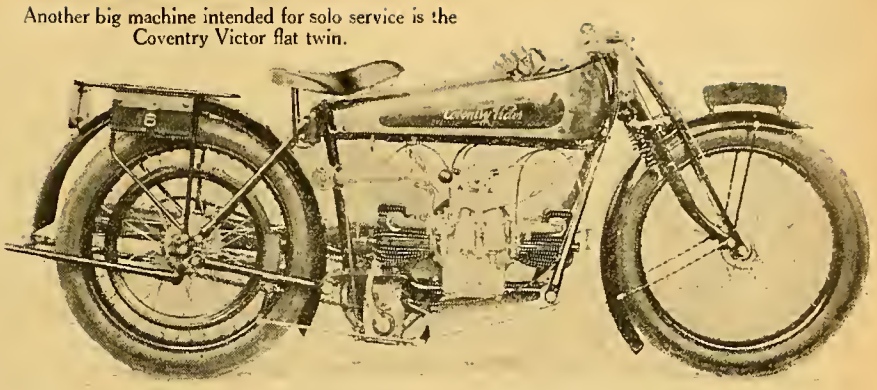
The other two models on the stand are the new 496 c.c. machine which has side valves and 26×3 in. tyres, but otherwise is much on the lines of the sporting model, and the 692 c.c. model especially meant for sidecar work. Both these machines have the chain drive from engine to gear box, concealed and protected by an aluminium coverplate, in distinction to the sporting model, on which the chains are visible. These two models are fitted with very large mudguards, affording ample protection to the rider and to the mechanism.

The location of the gear box (under the rear cylinder) and the method of engine mounting, permits the wheelbase of the Brough to be kept within reasonable limits.

A plated tank singles out one of the flat-twin Broughs for attention.



Another big machine intended for solo service is the Coventry Victor flat twin.



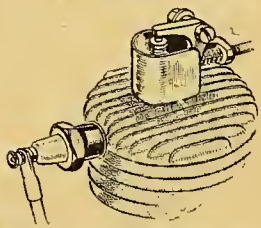
COVENTRY VICTOR. (28.)

Medium-weight Flat Twins.

5.7 H.P. MODEL.—75×78 mm. (688 c.c.); flat twin cyl. four-stroke; side valves; mechanical lubrication; twin Cox-Atmos carburetters; gear-driven mag.; 3-sp. gear; clutch and kick-starter; all-chain drive; 26×3in. tyres. Price: Solo, £110; with Sidecar, £136.

COVENTRY VICTOR MOTOR CO., LTD., Coventry.—There is something very imposing about the 80 m.p.h. Coventry Victor. In the same way as a semi-stripped 250 c.c.-350 c.c. machine may be likened to a torpedo-boat destroyer of the road, the big flat-twin under review may be called a Dreadnought. It has fairly full touring equipment, adequate mudguards, large tyres, and a 2½ galls. capacity saddle tank.

Technically, the most interesting feature about the engine (which follows standard lines except for a higher compression ratio and a modified valve gear) is the induction system. Two carburetters are employed, and a valve-controlled air inlet funnel faces forward. Air pressures in the induction pipe, both float chambers, and the fuel tank are balanced by connecting pipes, thus ensuring that a uniform flow of petrol takes place at the jets at all speeds, and irrespective of jars caused by road inequalities.



Protected compression release on the McKenzie engine.

An interesting detail refinement on this model is an aluminium undershield which also serves as a front stand. An addition of £5 to the list price is made for the 80 m.p.h. guarantee.

On a standard sports model, also shown, only one Cox carburetter is employed; the tank is not of the saddle variety, and the tyre is 28×2½in.

Touring types (one called the "Grey Ghost" and finished in grey) with and without the Holt spring wheel sidecar complete the exhibit. The prices are:—De Luxe touring solo £100, with Holt sidecar, £125; standard touring or sports solo £97 10s., with sidecar £119.

The long wheelbase model has been discontinued.

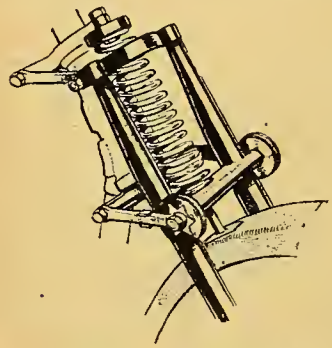
The Olympia Show.—

ROVER. (131.)

250 c.c. Model Introduced.

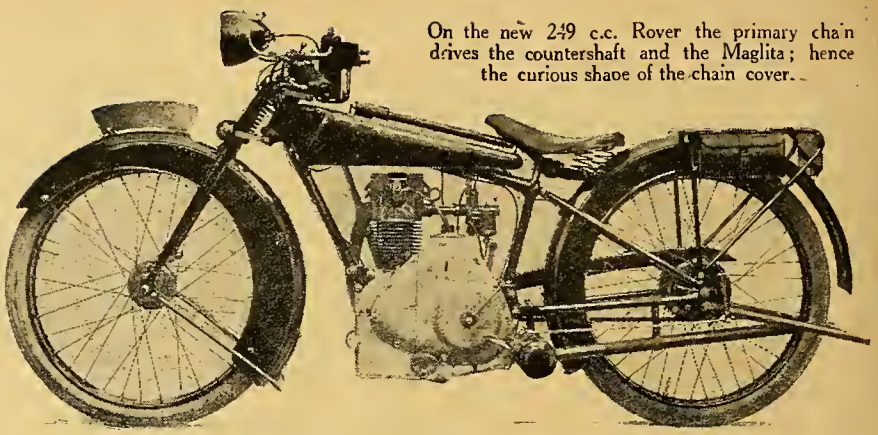
2.5 H.P. MODEL.—63×80 mm. (249 c.c.); single cyl. four-stroke; overhead valves; mechanical lubrication; B. and B. carb.; gear-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2¼in. tyres. Price £85.

THE NEW ROVER CYCLE CO., LTD., Coventry.—The Rover lightweight is numbered among the chief attractions of the Show, and its novel power unit is separately staged for the admiration of enthusiasts. This unit comprises engine, oil sump, gear box, kick-starter, clutch, and magneto, built up in a common assembly. The engine has overhead valves operated by roller bearing rocker shafts, and the detachable head is fixed by three studs. The primary drive is triangular, the chain passing over the magneto sprocket. In order to withstand the pull of the drive, a specially strengthened armature shaft is incorporated in the M-L Maglita. The chain is adjusted by bodily moving the magneto. The gudgeon pin bush is the only plain bearing in the unit. Lubrication is by splash, an oscillating plunger pump being used to raise oil from the sump into the crank case. An external lever adjusts the delivery aperture of this pump. Very attractive features of the machine are the B. and D. shock absorbers on the front fork, the new saddle tank, and the spring-up back stand.



Spring forks embodying B. & D. shock absorbers on the Rover lightweight.

On the new 249 c.c. Rover the primary chain drives the countershaft and the Maglita; hence the curious shape of the chain cover.



4 H.P. MODEL.—85×88 mm. (499 c.c.); single cyl. four-stroke; side valves; drip feed lubrication; B. and B. or Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 650×65 mm. tyres. Price: Solo, £95 Sports, £100 Standard; with Sidecar, £125 Sports, £130 Standard.

No changes have been thought necessary in this machine, except that, in view of increased police activities, the silencing of the sports edition has been substantially improved.

5-5 H.P. MODEL.—74×85 mm. (654 c.c.); twin cyl. four-stroke; side valves; hand pump lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 28×3in. tyres. Price: Solo, £115; with Sidecar, £145.

This model remains unchanged.

RAY. (16.)

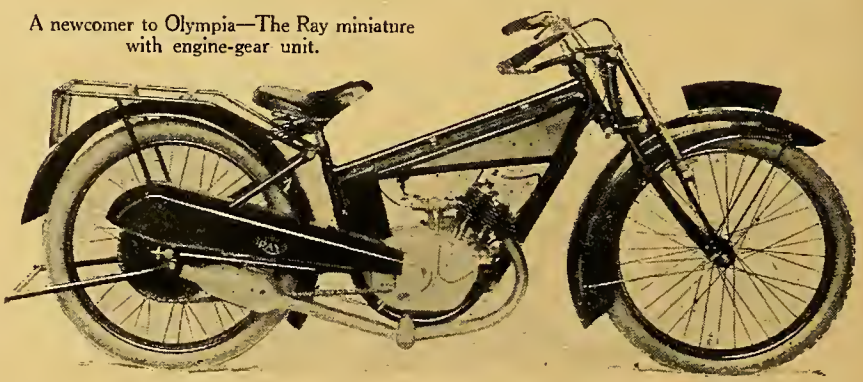
A Refined Miniature.

2 H.P. MODEL.—60×70 mm. (193 c.c.); single cyl. four-stroke; side valves; automatic lubrication; Amac carburetter; flywheel mag.; 2-sp. gear; clutch, no kick-starter; gear and chain drive; 24×2¼in. tyres. Price, £40 19s.

W. H. RAVEN AND CO., LTD., 223, Castle Boulevard, Nottingham.—Weighing 130 lb. and with a saddle height of only 24in., the Ray is a perfect miniature without the somewhat crude specification of the average machine in its class.

It has an engine and gear unit and metal plate clutch, all running in oil from the crank case sump. Final drive is by ½×0.205in. chain, also lubricated by oil from the crank case.

A newcomer to Olympia—The Ray miniature with engine-gear unit.

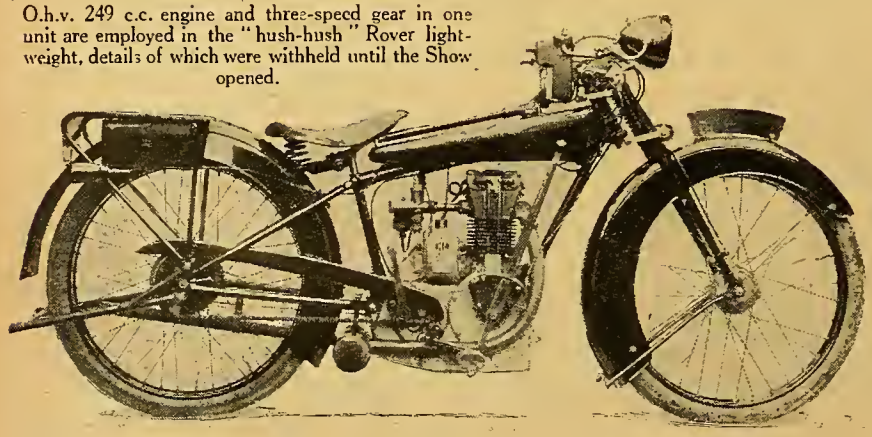


Accessibility has been the aim of the designer. Timing gear, cylinder, gears, and clutch may all be removed in a few minutes, leaving the crank case *in situ* in the loop frame. Plain bearings are employed in the engine—white metal for the big end—but the gear main shaft runs in ball races.

Quite a novelty is the use of a flywheel magneto, which, of course, gives one useless spark with each complete cycle. A plain electric head lamp supplied direct from a lighting coil in the magneto costs 30s. extra, and a more elaborate lighting set, including a battery, £4 2s. 6d.

The rear brake is of the external contracting type, provided with a neat spring

O.h.v. 249 c.c. engine and three-speed gear in one unit are employed in the "hush-hush" Rover lightweight, details of which were withheld until the Show opened.

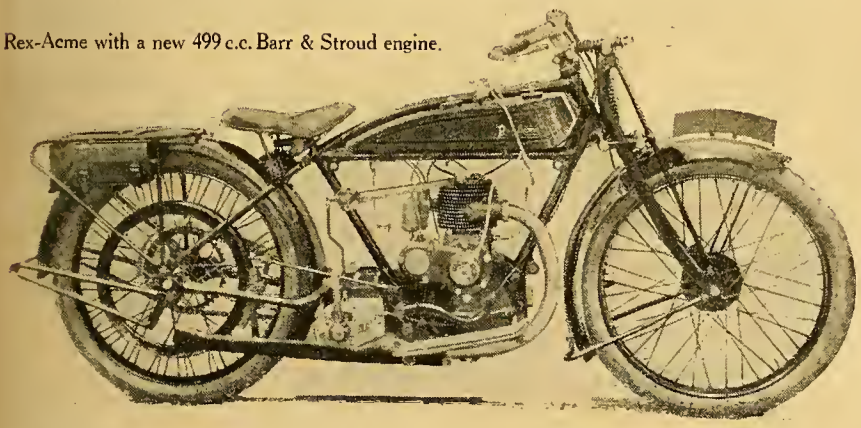


The Olympia Show.—

locking wing nut for adjustment. 175 m.p.g. fuel consumption and a rather remarkable road performance are claimed for this thoroughly workmanlike little solo machine.

sleeve valve engine mounted in a frame at the Show. The installation is particularly neat. The Best and Lloyd oil pump beds very nicely into the engine at a height which ensures its safety in a tumble.

Rex-Acme with a new 499 c.c. Barr & Stroud engine.

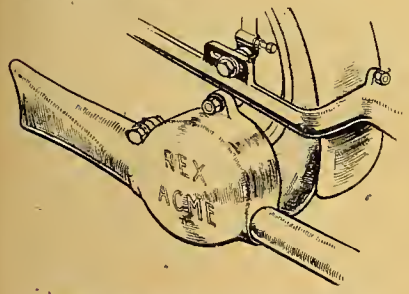


REX ACME. (133.)

Two-stroke and Sleeve Valve Engines.

1.7 H.P. MODEL.—60×60 mm. (170 c.c.); single cyl. two-stroke; petroil lubrication; Amac carb.; gear-driven mag.; 2-sp. gear; clutch, no kick-starter; chain and belt drive; 24×2in. tyres. Price £32 18s. 6d.

THE REX MOTOR MFG. CO., LTD., Coventry.—The Rex Acme range includes no fewer than seven models, of which interest will no doubt centre particularly in the two chief novelties. The cynosure of the exhibit is the Rex Minor, a 112 lb. feather-weight of neat and handsome design equipped with the firm's own two-stroke engine of 170 c.c.



Compact silencer on the Blackburne-engined Rex-Acme.

2¾ H.P. MODEL.—70×90.5 mm. (349 c.c.); single cyl. four-stroke; sleeve valve; drip lubrication; Amac carb.; chain-driven mag.; 2-sp. gear; clutch and kick-starter; chain and belt drive; 26×2½in. tyres. Price £65 15s.

The Rex Acme touring models are obtainable with a variety of engines. The heavy steering head, with special provision for bearing lubrication, is an excellent feature. The double girder rear stand and the internal expanding brakes deserve notice. On the sports models the straight-through exhaust pipe has a curiously-shaped expansion and tail box at its rear end.

4 H.P. MODEL.—86×86 mm. (499 c.c.); single cyl. four-stroke; sleeve valve; mechanical lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2½in. tyres. Price: Solo, £95; with Sidecar, £119/18/6.

This is noteworthy as being the only example of the 499 c.c. Barr and Stroud

SCOTT. (136.)

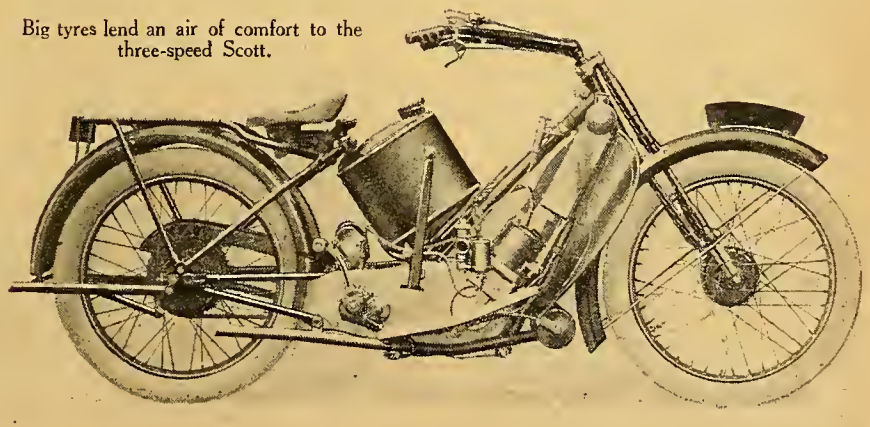
Three-speed Water Cooled Two-stroke.

3½ H.P. MODEL.—73×63.5 mm. (532.5 c.c.); side-by-side twin cyl. two-stroke; drip feed lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 700×80 mm. tyres. Price: Solo, £110; with Sidecar, £135.

SCOTT MOTOR CYCLE CO., Saltaire, Yorks.—The new three-speed Scott is an altogether bigger and heavier model than its predecessors, though it is still lighter than many four-stroke rivals of less capacity. The gear and magneto form a unit, readily detachable from the frame. The front chain is easily adjusted by sliding the gear box in its slotted cradle, and alignment cannot be lost in the process. The rear brake on this model is of the expanding pattern, and the wheel is detachable. Very wide channelled mudguards are fitted. The gear ratios can be altered very rapidly by changing the front sprocket of the secondary chain. A 3-gallon tank is standard, and a Magdyno can be readily fitted in the space behind the tank.

3½ H.P. MODEL.—73×63.5 mm. (532.5 c.c.); twin cyl. two-stroke; drip feed lubrication; Amac carb.; chain-driven magneto; 2-sp. gear; clutch and kick-starter; chain drive; 650×65 mm. tyres. Price: Solo, £95; with Sidecar, £120.

Big tyres lend an air of comfort to the three-speed Scott.



The standard two-speed model remains practically unaltered for next season, except that an internal expanding front wheel brake is now fitted.

3½ H.P. MODEL.—70×63.5 mm. (486 c.c.); twin cyl. two-stroke; drip feed lubrication; Amac carb.; chain-driven mag.; 2-sp. gear; clutch and kick-starter; chain drive; 650×65 mm. tyres. Price: Solo, £89; with Sidecar, £110.

The famous Squirrel has two minor but welcome alterations. The front brake is now of the expanding type, and the twin sight feeds of the lubrication system have been raised to a position where they are more easily watched.

POWELL. (167.)

Two-stroke Models Introduced.

4 H.P. MODEL.—85×96.5 mm. (547 c.c.); single cyl. four-stroke; side valves; hand pump lubrication; Amac carb.; chain-driven mag.; 3-sp. gear clutch and kick-starter; chain drive; 26×3in. tyres. Price: Solo, £90; with Sidecar, £110.

POWELL BROS., Wrexham.—Of the three 547 c.c. Powell machines, one is a sports model with low handle-bars and a low saddle position. The second is a fully-equipped touring machine, and the third has a sidecar. All three are interesting by reason of the high finish, the exceptionally workmanlike way in which the accessories and details are carried out, and the fact that the single-cylinder engine is carried in an inclined position, instead of vertically as is usual. Inclined as it is, the cylinder gives more room in which to work on any part of the engine, and to a certain extent better cooling is obtained. In addition, this machine has now a really serviceable front wheel brake, and seems altogether to be the work of practical riders.

2½ H.P. MODEL.—67×70 mm. (247 c.c.); single cyl. two-stroke; drip feed lubrication; B. and B. carb.; flywheel mag.; 2-sp. gear; clutch and kick-starter; chain and belt drive; 24×2¼in. tyres. Price £45.

A smaller model is a two-stroke on conventional lines and of very light weight. Care, however, has been taken to include everything which the rider may desire for the operation and control of the motor cycle. Mudguards of adequate width are fitted to protect the mechanism and the rider. There is also a 343 c.c. Villiers-engined model, which, with a three-speed gear, is suitable for light sidecar work.

The Olympia Show.—

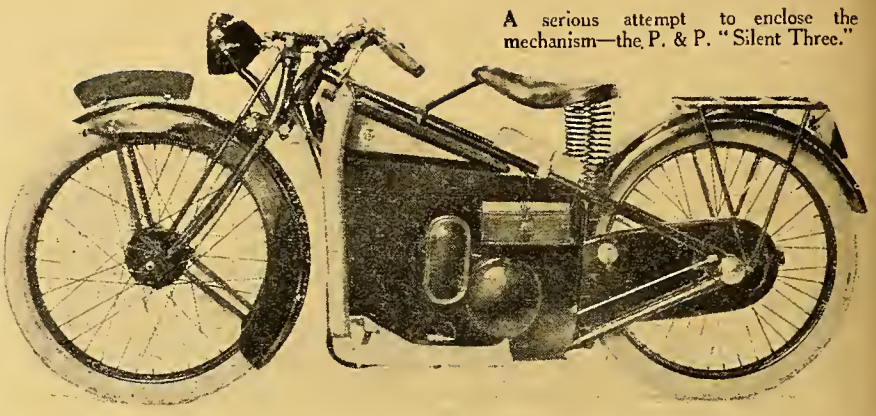
P. & P. (146.)

Silence First.

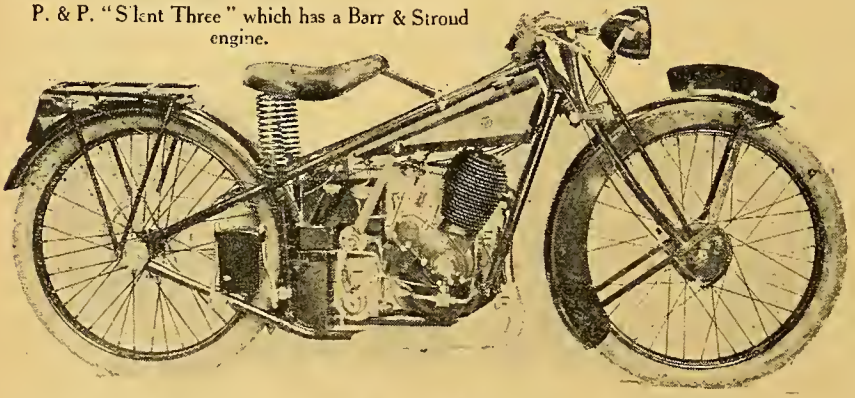
3.5 H.P. MODEL.—70×90.5 mm. (349 c.c.); single cyl. four-stroke; sleeve valve; mechanical lubrication; B. & B. carburetter; gear-driven magneto; 3-sp. gear; clutch and kick-starter; chain drive; 26×2½in. tyres. Price: Solo, £75; with Sidecar, £97 10s.

PACKMAN AND POPPE, Moor Street, Coventry.—Labelled the "Silent Three," this is a machine of which every detail will repay special attention, the design being original throughout. Starting with the B. & S. sleeve valve engine as a basis, the makers put silence in the forefront of their aims. Low down in front of the engine cradle is mounted an enormous expansion box, so constructed of aluminium as to destroy "ring." From this a central pipe leads to a large welded steel silencer above the bottom bracket, the gross capacity of the system being fourteen times that of the combustion chamber. To silence the transmission heavy ⅝ Renold chains are enclosed in tight-fitting aluminium cases. The frame is duplex with straight members running from the cleverly designed steering head to the rear hub. The live axle runs on two double-row self-aligning bearings provided with felt washers and dust caps. Lubrication is by a Best mechanical pump, self-priming by gravity from the tank. Ingenious provision is made for fitting leg shields, side shields, and an underscreen. The saddle is hinged in front and operated on two gigantic coil springs. Altogether a most interesting machine.

A serious attempt to enclose the mechanism—the P. & P. "Silent Three."



P. & P. "Silent Three" which has a Barr & Stroud engine.



lable. Mudguarding is exceptionally complete—it has been further improved for next year—and the entire mechanism, except the cylinder, is completely enclosed.

The friction transmission has also been improved, the face disc being reversible and thus doubled in length of wear; a new spring-loaded plunger makes the change speed lever self-locking and self-releasing on its quadrant.

Although 74 c.c. larger, the engine is practically a replica of last year's unit, but its silencing arrangements have been made more adequate, and there are various improvements which add to the accessibility of its ignition details. The kick-starter has been strengthened, and since it is mounted on an eccentric, the mesbing of the pinions may be adjusted to take up wear. Two internal expanding brakes are now employed, both on the rear hub, which incidentally has also been modified and has a quickly-withdrawable spindle.

Steering head bearings, front suspension, lighting (a single headlamp fed by the flywheel magneto and an auxiliary battery), and various detail fitments have received attention. The whole exhibit well repays examination, especially the plated chassis.

P.V. (19.)

Simple Spring Frame Models.

4-5 H.P. MODEL.—64.5×76 mm. (498 c.c.); V twin cyl. four-stroke; side valves; drip feed lubrication; Amac carburetter; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive 26×2½in. tyres. Price £90.

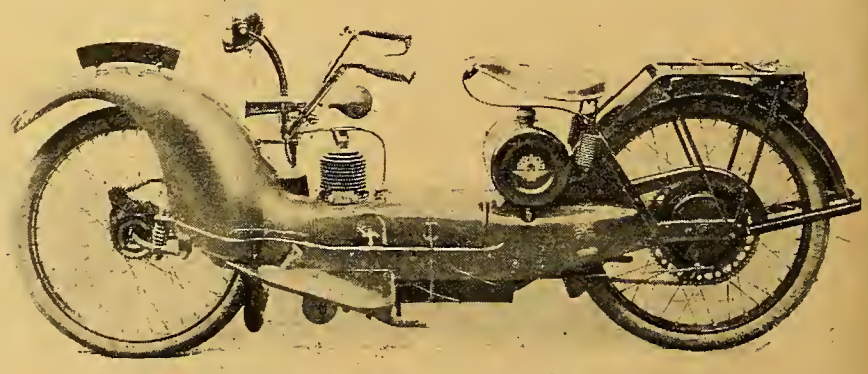
P.V. MOTOR CYCLES, LTD., Perry Vale, Forest Hill, London, S.E.23.—That it has survived so many years successfully when other systems appear and disappear in the course of a twelve-month proves that the P.V. spring frame is worth while. It is a simple design. Two pivoted arms, which carry the rear wheel, are extended to the saddle tube and connected with coil shock and rebound springs enclosed in the last-mentioned member. For 1923 the wheelbase has been considerably shortened by the simple expedient of moving the saddle tube forward so that its lower end is in front of the bottom bracket.

NER-A-CAR. (31.)

Car Practice on Two Wheels.

2½ H.P. MODEL.—70×74 mm. (283 c.c.); single cyl. two-stroke; petroil lubrication; B. and B. carb.; flywheel mag.; 5-sp. gear; clutch and kick-starter; friction drive; 26×2½in. tyres. Price £65.

INTER-CONTINENTAL ENGINEERING CO., 20, Conduit Street, London, W.1.—After a most favourable reception in many quarters during 1921-22, the Ner-a-Car reappears in a considerably improved form. Its aim, of course, was, and is, to be what its name denotes, although, curiously enough, the name was actually derived from the American designer, a Mr Neracher. It follows car lines in having a low sling chassis and a system of pivoting axle steering which combine to make it remarkably stable and easily control-

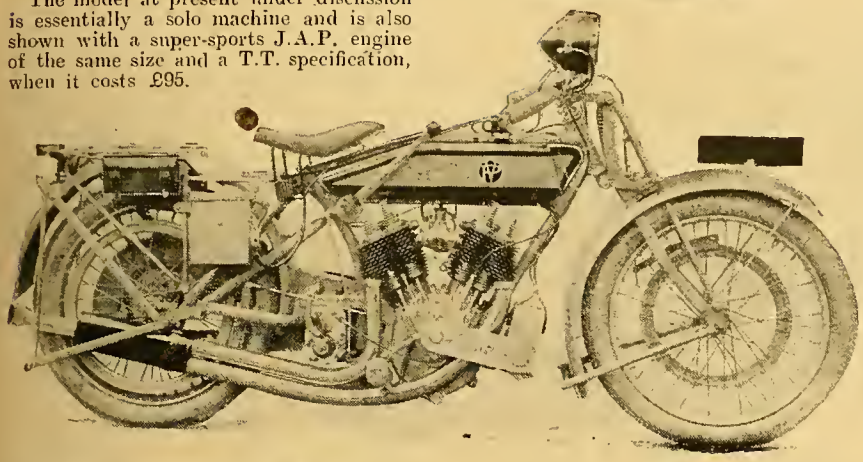


Better mudguard construction is a 1923 Ner-a-Car improvement.

The Olympia Show.—

The model at present under discussion is essentially a solo machine and is also shown with a super-sports J.A.P. engine of the same size and a T.T. specification, when it costs £95.

New 976 c.c. spring frame P.V.



Essentially the same as the 498 c.c. touring model is the 654 c.c. sidecar outfit, the chassis of which embodies a spring wheel suspended on exactly the same system as the cycle. The body is further insulated by two pairs of flexible C springs, underslung in front.

Detail work is well carried out. Braking is on dummy belt rims front and rear, front stands with neat clips are fitted in each case, and the Jackstand, an easy action two-step device introduced at the last Show, is embodied on the touring machines.

Also on the same lines is an entirely new model with the 976 c.c. J.A.P. engine. It is priced at £145 solo, and £167 with the P.V. sidecar. A B.T.H. mag-generator costs £17 extra.

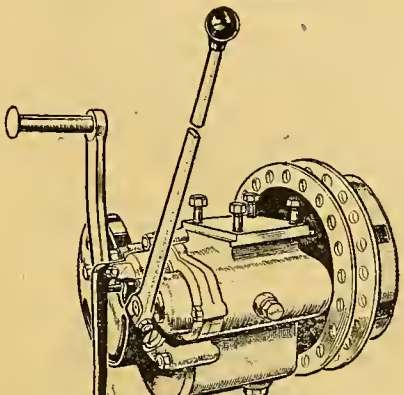
One of the P.V. lightweights to which a 349 c.c. Barr and Stroud engine is fitted follows the same specification, when the price is £76, but the remaining Villiers- and J.A.P.-engined machines, all under 350 c.c., have final belt drive and cost from £42 upwards.

GNOME-RHONE. (26.)

An Anglo-French Product.

4 H.P. MODEL.—85×88 mm. (499 c.c.); single cyl. four-stroke; side valves; hand pump lubrication; own carburetter; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain and belt drive; 26×2¼in. tyres. Price, £69.

OVERSEAS SALES, LTD., 21, George Street, Hanover Square, London, W.1.—Designed by an Englishman, but made in France, the Gnome-Rhone is more interesting because of the intention to manufacture it on mass-production lines (10,000-20,000 per annum is the suggested output) than for any unconventionalities in its construction. Indeed, although nearly the whole of the vital parts of the machine are produced in the huge Gnome-Rhone aeroplane factory (excepting the magneto), the layout and design generally are on the very simplest and most straightforward lines. Except the bottom bracket, all the frame lugs are drop forgings.

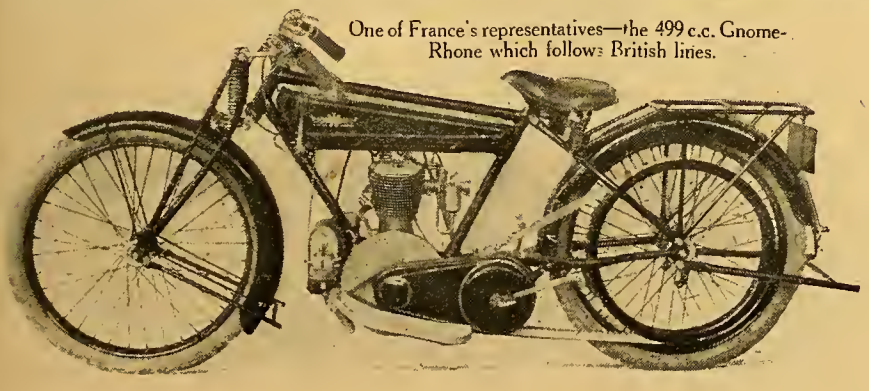


Sturdily-built Gnome-Rhone three-speed gear box, replacing the proprietary unit first used on this machine.

The engine, which has a roller-bearing big end and a ball-bearing mainshaft (transmission side), has an external flywheel with the primary sprocket on the outside. Thus it has been easy to enclose the primary chain in a neat case. Valve ports have been designed to give an easy flow to the gases.

Other items worthy of inspection are the long pedal-operated direct-acting rear brake, the flywheel brake, and the air strangler to facilitate starting. Footboards and fairly adequate mudguards are fitted to all the models shown, and to one model a simple spring wheel sidecar with an English body is attached.

One of France's representatives—the 499 c.c. Gnome-Rhone which follows British lines.



VICTORIA. (62.)

Models from Scotland.

1½ H.P. MODEL.—55×62 mm. (147 c.c.); single cyl. two-stroke; petroil lubrication; Amac carburetter; flywheel mag.; 2-sp. gear; no clutch or kick-starter; chain and belt drive; 26×2in. tyres. Price, £45.

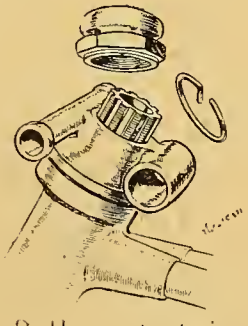
VICTORIA MOTOR AND CYCLE CO., LTD., Victoria Works, Dennistoun, Glasgow.—Victoria machines are amongst the few motor cycles coming from Scotland. All the five models manufactured and placed on the market are exhibited, and are divided into two categories: the one with the well-known Villiers two-stroke, the other with the J.A.P. engine. Of those with the Villiers engine the little 147 c.c. machine merits particular attention as a motor cycle runabout with very few parts that will require attention, allied with simple and workmanlike control.

3½ H.P. MODEL.—79×70 mm. (343 c.c.); single cyl. two-stroke; drip feed lubrication; Amac carburetter; flywheel mag.; 3-sp. gear; clutch and kick-starter; chain and belt drive; 26×2¼in. tyres. Price: Solo, £55; with sidecar, £70.

There is nothing startling in the design of the largest two-stroke model, to which is attached a fairly roomy sidecar of attractive and well-balanced proportions.

4 H.P. MODEL.—85.5×95 mm. (549 c.c.); single cyl. four-stroke; side-by-side valves; drip feed lubrication; Amac carburetter; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain and belt drive; 26×2½in. tyres. Price: Solo, £75; with sidecar, £90.

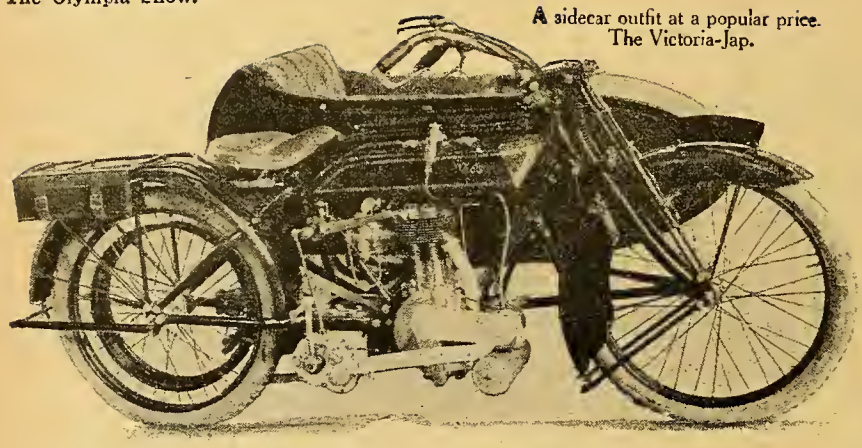
The J.A.P.-engined machine falls into another category, being much more powerful; it has a Sturmey-Archer gear box, deep and wide mudguards, and, in general, the specification is as simple as possible. The example shown is attached to a sturdy and well-built little sidecar to emphasise the particular purpose of this model.



Double security steering head feature of the P & P

The Olympia Show.—

A sidecar outfit at a popular price. The Victoria-Jap.



FRANCIS-BARNETT. (81.)

Refined Mounts in 350 c.c. Class.

2½ H.P. MODEL.—70×76 mm. (293 c.c.); single cyl. four-stroke; side valves; hand pump lubrication; B. and B. carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2¼in. tyres. Price £64.

FRANCIS-BARNETT, LTD., Lower Ford Street, Coventry.—In the main both the sporting and the touring models of the 293 c.c. Francis-Barnett are unaltered from the machines that were on the road last year. The touring machine in particular is a good, solid-looking and reliable type, well equipped, and not expensive. Considerable care has been taken to make it possible to remove the rear wheel with the minimum of trouble. The second model is almost identical in lines with its predecessor, but is of 346 c.c., and costs £72 as a solo machine, or £85 with a neat sidecar.

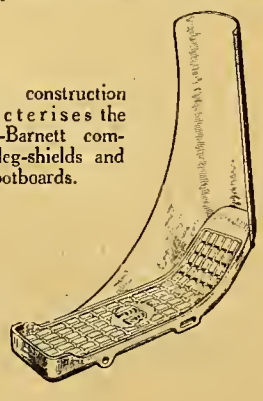
Another model with the 346 c.c. engine is a sports machine painted a very nice and serviceable grey. Naturally, it has the super-sports J.A.P. engine, and incidentally has been extremely successful in various important competitions this year.

On the Francis-Barnetts the tool kit is carried on behind the seat tube, where it is in many ways better protected and less subject to vibration.

Greater clearance has been provided between the mudguard and the wheel, and the chain guards, which are substantial, are secured in position by two bolts only, so that they can be detached quite easily.

Power unit of the new 346 c.c. solo New Hudson.

Neat construction characterises the Francis-Barnett combined leg-shields and footboards.



NEW HUDSON. (142.)

Varied Single Cylinders.

2¾ H.P. MODEL.—70×90 mm. (346 c.c.); single cyl. four-stroke; side valves; mechanical and hand lubrication; Binks carburetter; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 650×65 mm. tyres. Price, £65.

NEW HUDSON, LTD., Icknield Street, Birmingham.—The 346 c.c. New Hudson is an entirely new model, the engine being distinctly reminiscent of the firm's bigger power unit. The cylinder carries enormous radiating fins, whilst the gases are led away through an exhaust pipe of unusually large bore into an aluminium expansion box mounted just forward of the rear hub. The valves are no less than 1¾in. in diameter The cast aluminium chain cases are amongst the handsomest in the Show. Both brakes are of the internal expanding pattern. Following what is now standard New Hudson practice, the tank is made in two sections telescoping into each other, so that the partition is readily accessible should repairs become necessary. A 498 c.c. solo model is materially the same.

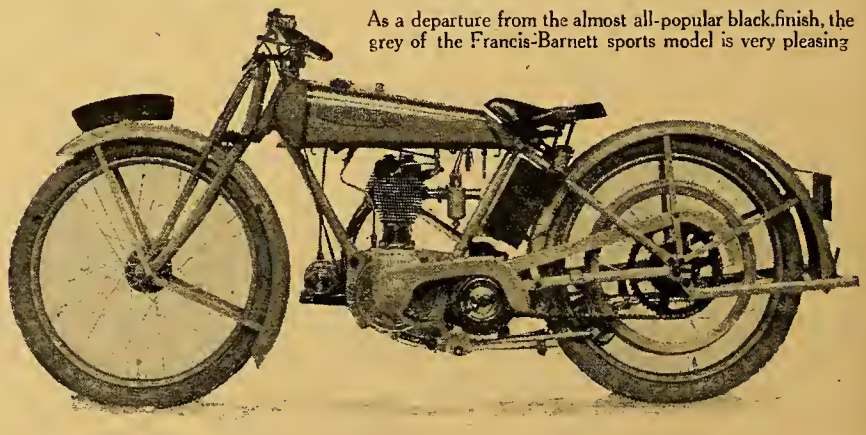
2¼ H.P. MODEL.—62×70 mm. (211 c.c.); single cyl. two-stroke; drip feed lubrication; B. & B. carburetter; chain-driven mag.; 3-sp. gear; chain and belt drive; 24×2in. tyres. Price, £39.

The small two-stroke New Hudson is again offered in three forms for 1923, namely, the popular, sporting, and tourist models, which have proved so satisfactory that they remain unchanged except for the addition of footboards to the popular edition.

4.5 H.P. MODEL.—87×100 mm. (595 c.c.); single cyl. four-stroke; side valves; mechanical and pump lubrication; B. & B. carburetter; chain-driven magneto; 3-sp. gear; clutch and kick-starter; chain drive; 700×80 mm. tyres. Price with Sidecar, £112.

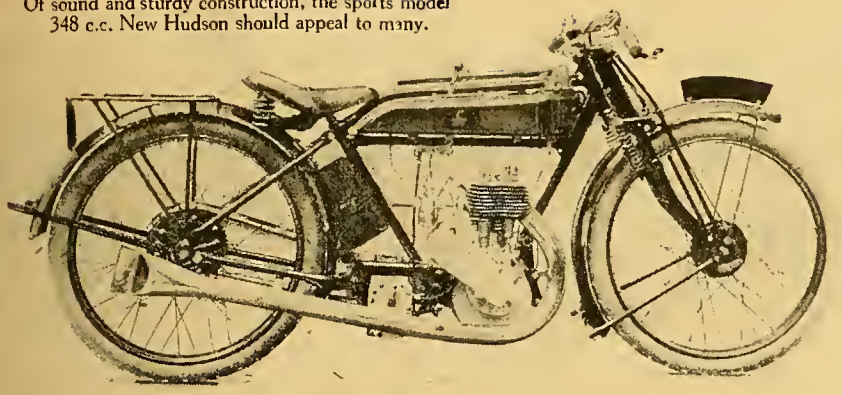
This machine has earned such a high reputation in its class that any substantial alterations were obviously unnecessary. The steering head merits special study, being equipped at top and bottom with ball bearings of unusually large size charged with sufficient grease to last the season. The firm's new pattern silencer now figures on this model. The rear sidecar connection has been redesigned to eliminate twisting stresses. The tank is of the firm's special two-piece design. Four editions of this model are offered, namely, standard, sporting, *de luxe*, and

As a departure from the almost all-popular black finish, the grey of the Francis-Barnett sports model is very pleasing



The Olympia Show.—

Of sound and sturdy construction, the sports model 348 c.c. New Hudson should appeal to many.



family, the latter being fitted with a double-seated sidecar. Special provision is made for positively adjusting the tension of the magneto and primary driving chains.

DOT. (59.)

Sports Twin and Light Singles.

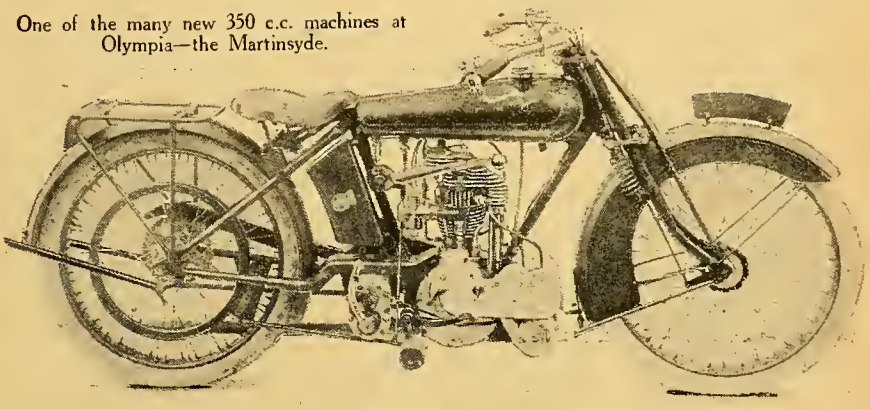
8 H.P. MODEL.—85.5×85 mm. (976 c.c.); V twin cyl. four-stroke; side valves; drip feed lubrication; Amac carburetter; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 28×3in. tyres. Price, £140.

D.O.T. MOTORS, LTD., 69A, Market Street, Manchester.—Of the machines on the D.O.T. stand the model which will appeal instantly to riders of the sporting type is the 976 c.c. super-sports model, every line of which suggests speed. It is fitted with a J.A.P. engine, having side valves and heavily finned valve caps.

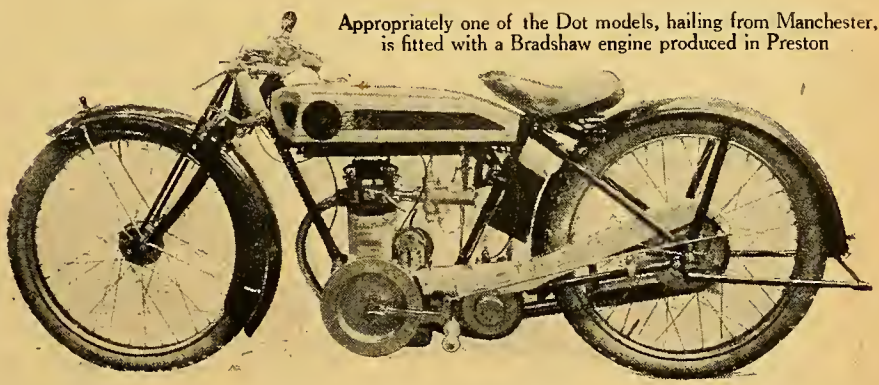
2½ H.P. MODEL.—70×76 mm. (292 c.c.); single cyl. four-stroke; side valves; hand-pump lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain and belt drive; 26×2⅝in. tyres. Price, £65.

Other models are the 292 c.c. J.A.P.-engined standard and the T.T. types, the latter shown without a carrier and with the top tube concealed by the tank, wide handlebars with very effective rubber grips and single practical-looking footrests. It also has a J.A.P. engine of 70×76 mm. (292 c.c.). A 250 c.c. model with a Blackburne overhead valve engine, and last, but not least, one of the new type machines having the 350 c.c. oil-cooled Bradshaw single-cylinder engine are also on view. This last is a new venture for the firm, and is of very neat design.

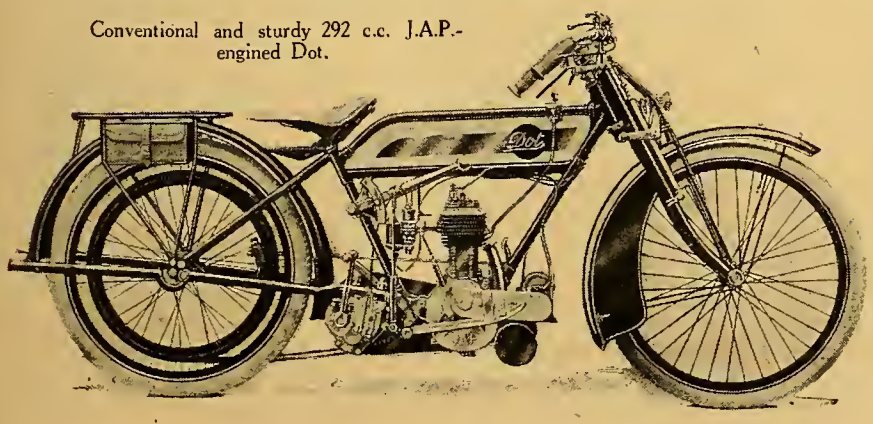
One of the many new 350 c.c. machines at Olympia—the Martinsyde.



Appropriately one of the Dot models, hailing from Manchester, is fitted with a Bradshaw engine produced in Preston



Conventional and sturdy 292 c.c. J.A.P.-engined Dot.



MARTINSYDE. (30.)

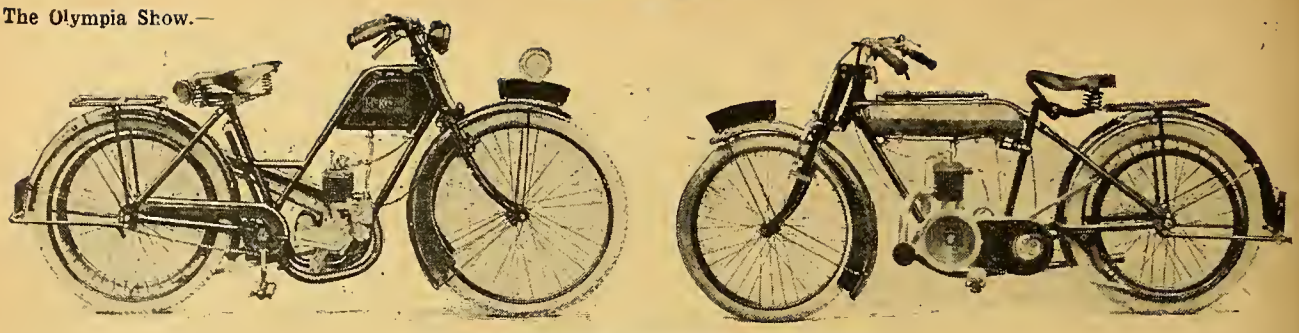
Overhead Exhaust Valves.

2¾ H.P. MODEL.—70×90 mm. (346 c.c.); single cyl. four-stroke; overhead exhaust valve; mechanical lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2½×2¼in. Price: Solo, £70; Sports, £72.

MARTINSYDE, LTD., Woking.—No more interesting reply to the insistent demand for 350 c.c. solo machines has yet appeared than the new Martinsyde single. Following normal Martinsyde practice, the exhaust valve is of the overhead pattern. In this position, it is claimed, it gets the maximum cooling draught, which after all is a very reasonable theory. The o.h.v. gear is a model of simplicity and accessibility. The rocker pivots on an inverted knife edge, being retained in position by a light coil spring, which also keeps the tappet down. The valve stem, which has a shoulder upon which the rocker end abuts, extends through a cover plate in the head to the end of a leaf spring. This cover plate, which carries the knife edge bearing, is readily detachable, and thus the complete valve gear may be dismounted very easily. The exhaust port is well ribbed throughout its length. Otherwise the engine is not unconventional, although the method of driving the Showell oil pump from an idler sprocket on the magneto chain, the pump being enclosed in the chain case, is certainly worthy of note. The fuel tank fixture by means of a concealed clamp is also ingenious.

An internal expanding brake is fitted in front, but a dummy belt rim is employed in the rear, which, after all, is a system that has many advantages.

The Olympia Show.—



Two models of the popular McKenzie are now produced.

In a sports form, a Ricardo aluminium piston, a close ratio Sturmey gear box and a racing Amac carburetter are fitted, resulting in an extremely attractive-looking "speed iron."

6 H.P. MODEL.—70×88 mm. (678 c.c.); V twin cyl. four-stroke; overhead exh. valves; foot pump lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; all chain drive; 26×3in. tyres. Price, £125.

The "Quick Six" Martinsyde, which is shown as a solo machine only, remains substantially unchanged. Its price, with an 80-m.p.h. guarantee, is £135.

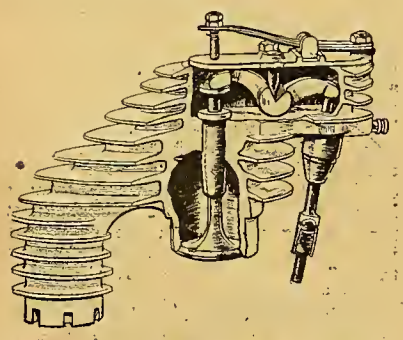
On the touring standard sports and tradesman's carrier sidecar outfits the new valve gear is the chief alteration of importance if we except the new prices, which are identical for the three—£130.

McKENZIE. (145.)

Popular Motorised Bicycle.

1¾ H.P. MODEL.—60×60 mm. (169 c.c.); 1 cyl. two-stroke; petroil lubrication; Wex carb.; gear-driven mag.; single-sp. gear; belt drive; 26×2in. tyres. Price £27 6s.

GEO. MCKENZIE, 220, Shaftesbury Avenue, London, W.C.2.—The featherweight McKenzie set a fashion in miniatures; it scales no more than 80 lb. all on, and is deliberately fitted with pedals not only for assistance up unusually steep gradients, but also to inspire the rider with confidence in the case of a possible breakdown on the road. The machine has been simplified to the absolute limit for the sake of unmechanical users; apart from the brakes, with which every cyclist is familiar, there are only two levers, the compression release and the throttle. A coaster hub is no longer used for the rear brake, which now consists of an ordinary belt rim shoe, operating by back-pedalling at two points in the circle of the cranks. A very light spring fork is fitted to reduce road shocks. The price includes all necessary accessories.



Extremely simple and accessible Martinsyde overhead exhaust valve gear.

A WORD TO NEW READERS.

This number of *The Motor Cycle* is mainly devoted to the all-important topic of the moment—the Motor Cycle Exhibition at Olympia, and the 1923 models exhibited therein. It is not a normal issue either in size or the nature of its contents. The beginner will find every issue of *The Motor Cycle* is of assistance to him, as well as proving absorbingly interesting. *The Motor Cycle* is unapproached in the quality and substance of its reading matter. Each issue contains features which the process of time have proved to be the most popular among experienced riders and with the newcomer to the motor cycle movement.

Our aim is:—

(1) To record faithfully motor cycling history at home and abroad.

(2) To interest the ever-increasing number of motor cyclists by discursive articles of an authoritative character on popular subjects.

(3) To continue to foster the development of the most economical form of motoring.

(4) To assist the novice.

(5) To encourage progress in design by free and open criticism.

(6) To develop the three-wheeled passenger motor cycle, whether sidecar or runabout.

Over 120,000 Motor Cyclists read *The Motor Cycle* every week.

The Motor Cycle is written by Motor Cyclists for Motor Cyclists.

Every Thursday - Threepence.

1¾ H.P. MODEL.—60×60 mm. (169 c.c.); 1 cyl. two-stroke; petroil lubrication; Wex carb.; gear-driven mag.; 2-sp gear; clutch; no kick-starter; chain-cum-belt drive; 24×2in. tyres. Price £33 10s.

This is another edition of the McKenzie on conventional motor cycle lines. Its weight is given as 120 lb.

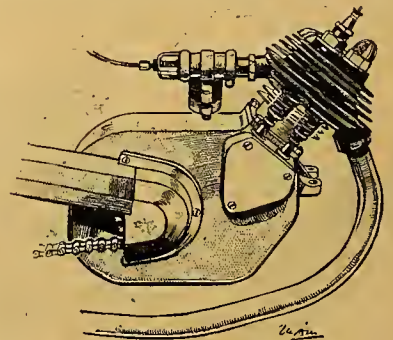
ORBIT. (24.)

Four Lightweights.

2¾ H.P. MODEL.—68×72 mm. (261 c.c.); single cyl. two-stroke; drip feed lubrication; B. and B. carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2¼in. tyres. Price £55.

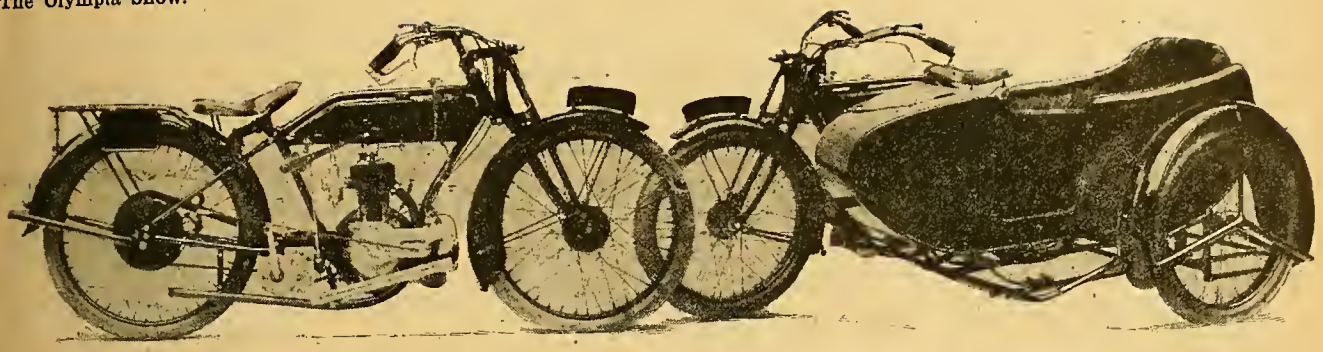
ORBIT MOTORS, LTD., Orbit Works, Wolverhampton.—Four Orbit lightweights are shown, all practically to an identical specification, excepting in the engine units. Only the two-stroke, as detailed above, is fitted with the firm's own power unit, a conventional but well-carried-out design of the three port type with plain bearings and a deeply-finned cylinder. Internal expanding brakes on the front and rear wheels, a well-balanced front mudguard, and a capacious metal tool box on the saddle tube, are items common to all four models, although a Bradshaw-engined type is distinctive on account of its pair of highly-polished aluminium mudguards. Swan front forks, which have an enclosed central shock and rebound spring, are employed in every case. The silencer, which is right at the end of the exhaust pipe, is of Orbit design and embodies baffle plates.

For the rest the exhibit is best described by detailing the prices of the models not covered by the specification: 349 c.c. Barr and Stroud, £67 10s. (A.J.S. lightweight sidecar, £20 extra); 349 c.c. Bradshaw, £67 10s.; o.h.v. 349 c.c. Blackburne (semi-racing equipment), £70. Disc wheels are an extra.



One of the several engine-gear units at Olympia is on the Ray ultra lightweight.

The Olympia Show.—



349 c.c. side-valve O.E.C.-Blackburne in its full touring form.

Well-upholstered sidecar attached to the 545 c.c. model of the same machine.

O.E.C.-BLACKBURNE. (40.)

Taxi Sidecar Outfit.

10 H.P. MODEL.—85×96 mm. (1,090 c.c.); V twin cyl. four-stroke; side-by-side valves; drip feed lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 28×3in. tyres. Price, with Taxi Sidecar, £252.

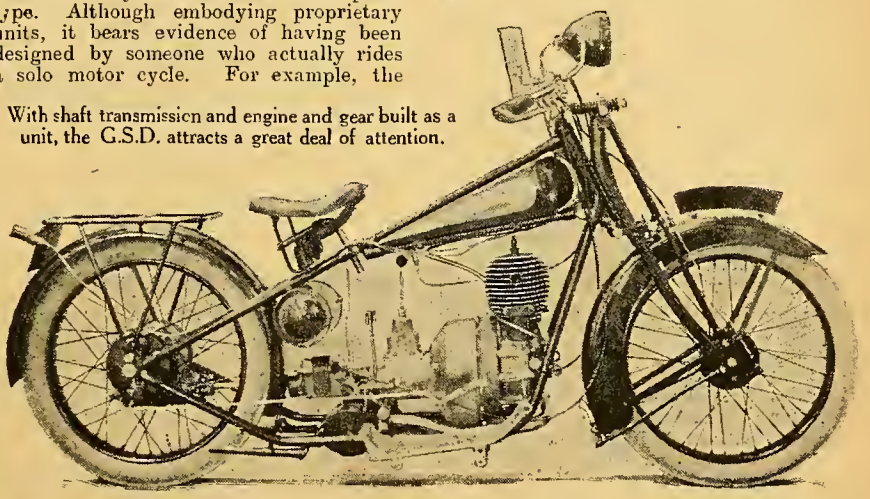
OSBORNE ENGINEERING CO., LTD., Lees Lane, Gosport, Hants.—Finished in a very striking shade of cream, the chief Osborne exhibit—a 1,090 c.c. taxi sidecar—is remarkable for the fact that it has a system of wheel steering instead of handle-bars. This arrangement for sidecar taxis was introduced last year to overcome the difficulties caused by handle-bars which foul a high sidecar body when making sharp turns. The price of £252 includes Magdyno lighting, very complete equipment generally—for instance an undershield is fitted—and a limousine two-seater sidecar mounted on a very strong girder chassis. Dual hand and foot clutch control is provided.

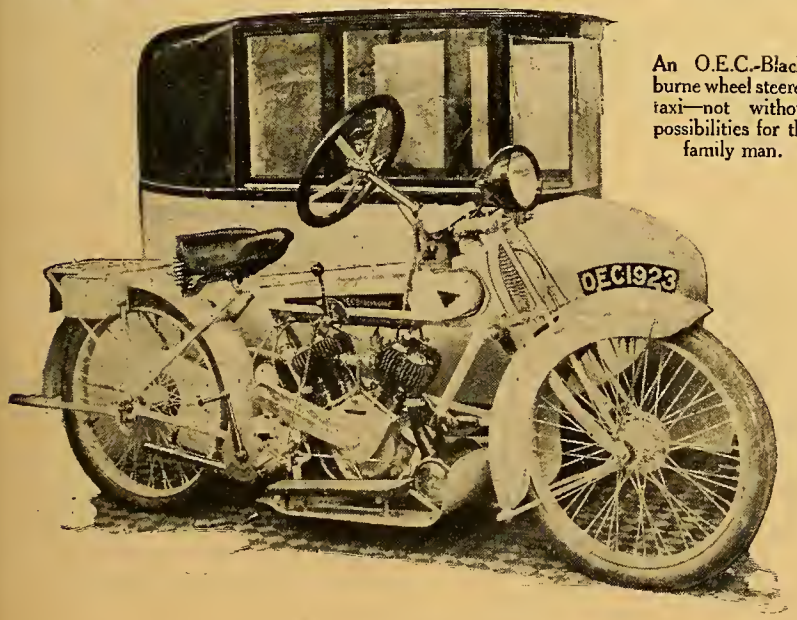
Imposing single- and double-seated touring sidecars are inherently the same in specification, but employ the 998 c.c. Blackburne engine. The prices range from £140 14s. upwards.

2¾ H.P. MODEL.—71×88 mm. (348 c.c.); single cyl. four-stroke; overhead valves; mechanical lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch, no kick-starter; chain drive; 26×2½in. tyres. Price £84.

For the soloist the most attractive model is undoubtedly the overhead valve sports type. Although embodying proprietary units, it bears evidence of having been designed by someone who actually rides a solo motor cycle. For example, the Burman gear lever is right forward, and thus allows the rider to grip the tank with his knees. Handle-bar shape, foot-rest position, and saddle height combine to give a very comfortable riding position.

With shaft transmission and engine and gear built as a unit, the G.S.D. attracts a great deal of attention.





An O.E.C.-Blackburne wheel steered taxi—not without possibilities for the family man.

The display is completed by a side-valve 349 c.c. model (solo at £71 8s., and with a light sidecar at £97 13s.), and a utility 545 c.c. sidecar outfit at £113 8s. None of the last-mentioned machines has a mechanical oil-pump, and the larger sidecar outfit differs in having 28×3 in. wheels and internal expanding brakes front and rear.

G.S.D. (44.)

Four Speeds and Shaft Drive.

2¾ H.P. MODEL.—76×76 mm. (350 c.c.); single cyl. two-stroke; mechanical lubrication; Amac carb.; shaft-driven mag.; 4-sp. gear; clutch and kick-starter; shaft drive; 26×3in. tyres. Price £85.

R. E. D. GRANT, 15, St. Paul's Road Coventry.—That it exhibits the novelty of the Show is claimed for considerably more than one stand in Olympia, but there seems to be a general consensus of opinion that No. 44 comes nearest to earning this honour. The G.S.D. has a unit engine and four-speed gear box and final shaft drive, and is the only British machine now on the market to employ this oft-sought form of transmission. Of the car type and design, the gear box has a central ball and socket change,

The Olympia Show.—

and with the high efficiency White and Poppe two-stroke engine forms a snug and easily removable unit in the duplex frame.

Very careful design is apparent in the transmission, and since the David Brown worm and worm wheel are in one unit, the danger of misalignment is eliminated. Hardy flexible couplings are interposed at each end of the shaft, which is in absolute line with the gear shaft and the worm shaft. The gear ratios are 6, 9, 13, and 18 to 1, and the gear box and gear change has been so designed as to obviate any possibility of damaging the gears when changing. A sectioned box is shown.

The engine unit is cleanly encased and is claimed to be oilproof, an oil tank being incorporated in the flywheel casing and fitted with a float type oil indicator. Mechanical lubrication with a variable feed is employed.

Riding position and the rider's comfort generally have received careful attention, it being the intention of the designer to appeal to the most fastidious class of professional men.

In most respects he has succeeded admirably, and one cannot help being struck at the close resemblance of the machine to a composite model of the best of the oft-published "ideal specifications" of *The Motor Cycle's* readers.

ZENITH. (21.)

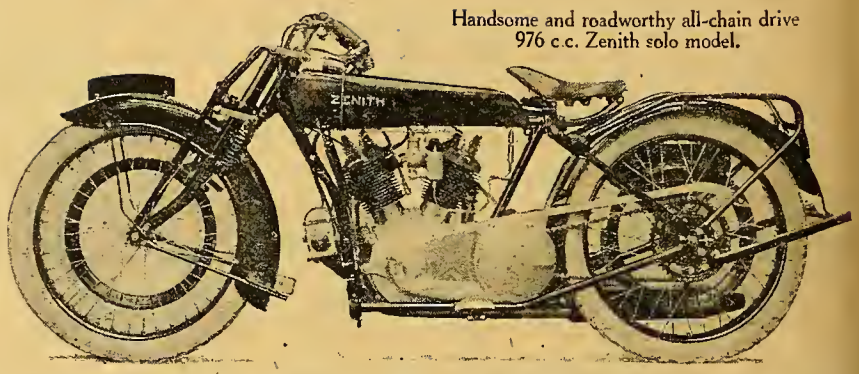
Chain-driven Twins and Singles.

8 H.P. MODEL.—85.5×85 mm. (976 c.c.); V twin cyl. four-stroke; side valves; drip feed lubrication; Amac carburetter; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 28×3in. tyres. Price, £125.

ZENITH MOTORS, LTD., Hampton Court.—In the latest edition of the 976 c.c. Zenith the lessons of many years of catering for the soloist who favours big twins, plus those of 100 m.p.h. records on the track, have been cleverly blended to produce one of the most attractive solo machines in the exhibition. In brief, now that chain drive has almost entirely ousted the belt from public favour, the Zenith Company has more than moved with the times.

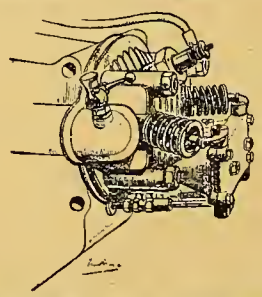
The frame is very neat and promises considerable rigidity, while the saddle height is low. The footrests are sensibly placed and are of the flat type as used by Le Vack on Brooklands.

Handsome and roadworthy all-chain drive 976 c.c. Zenith solo model.



The price quoted is for a model with the super-sports J.A.P. engine; £10 less is charged for the standard power unit.

An extremely racy mottled aluminium sidecar with a streamlined chassis is shown attached to this model.



Improved valve gear on the Zenith-Bradshaw.

3½ H.P. MODEL.—68×68 mm. (494 c.c.); flat twin cyl. four-stroke; overhead valves; mechanical lubrication. Claudel-Hobson carburetter; gear-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2½in. tyres. Price, £105.

Little change has been made to the Bradshaw model, which was the first make to which this type of oil-cooled engine was fitted, and which is still the only one to use the flat twin version. The rocker gear, however, is now enclosed and wick-lubricated.

Since the centre of gravity of the machine is comparatively low down, this model possesses several advantages as a solo mount, but it has been proved in several important trials that it is capable of hauling a sidecar anywhere within reason.

2¾ H.P. MODEL.—70×90 mm. (346 c.c.); single cyl. four-stroke; side valves; drip feed lubrication; Amac carburetter; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2½in. tyres. Price, £69 15s.

The 346 c.c. Zenith is not in any way a startling design—for the most part it embodies standard proprietary units—but it is thoroughly pleasing in appearance, particularly in its sports form, and well finished in detail. Another exhibit with a 293 c.c. J.A.P. engine is materially the same; it is priced at £65. Only one Gradua-geared (variable pulley) model is shown; it has a 654 c.c. J.A.P. engine, and a clutch and kick-starter.

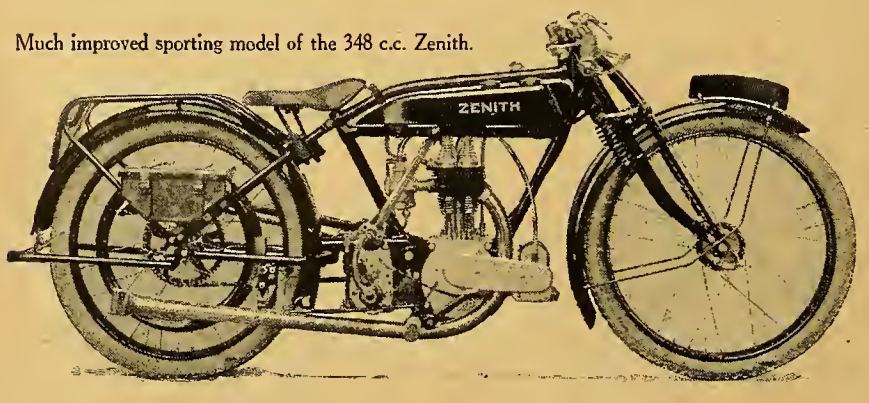
HACK. (91.)

Scooter Type's Sole Representative.

1¼ H.P. MODEL.—50.4×50.4 mm. (103 c.c.); single cyl. two-stroke; petroil lubrication; Binks carb.; gear-driven mag.; clutch, no kick-starter; chain drive; 20×1¾in. tyres. Price: Solo, £38 17s.

HACK ENGINEERING CO., Victoria Works, Victoria Road, Hendon, N.W.4.—The Hack lightweight is illustrative of an intermediate stage between the scooter and the ultra-lightweight motor cycle. The makers are to be congratulated on having achieved simplicity in their design. The wheels are fitted with 20×1¾in. tyres, and the transmission is of the simplest form by means of a single chain of not unreasonable length direct from a geared down countershaft on the engine to the back wheel. The machine is suitable for a lady to ride, a practical form of guard being provided to prevent contact of garments with the cylinder. The engine is situated at the bottom of the saddle pillar, and the centre of gravity is thus kept low down.

Much improved sporting model of the 348 c.c. Zenith.



LEA-FRANCIS. (95.)

Refined V Twins.

5 H.P. MODEL.—64×92 mm. (592 c.c.); V twin cyl. four-stroke; overhead inlet valves; drip feed lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×3in. tyres. Price: Solo, £96 10s.

LEA & FRANCIS, LTD., Coventry.—To the most critical, the Lea-Francis models are a joy. This firm has always had a reputation for the highest class of workmanship and the most refined productions. Two models only are at present shown, both with V twin M.A.G. engines, which differ only in the matter of the stroke, the larger model having a bore and stroke of 64×92 mm., whereas the stroke in the case of the smaller machine is only 77 mm. (496 c.c.). These machines have

The Olympia Show.—

always been noted for quiet running, and the bigger model, which perhaps attracts the most interest on the stand, is fitted with an aluminium silencer of ample dimensions. Chain guards are provided for the larger model, but the smaller machine, which is made for the solo rider, is fitted with complete chain cases, and the three-speed gear is of the firm's own manufacture; the other being a Burman. The brake work has been very thoroughly carried out, dummy belt rims being provided on both front and rear wheels, and the arrangement and application of the brake shoes is also very well carried out. In the case of the smaller model the frame is slightly shorter than that of the 592 c.c. model, and the gear box is fitted in the bottom bracket shell. In the larger machine, however, advantage is taken of the space between the seat pillar tube and the rear mudguard for fitting a good-sized leather tool case, which itself is enclosed in sheet steel. A feature of refinement which commands special attention on this machine is the provision of two shock absorbers for the chain drive, one in the countershaft, and one in the rear hub, which is the standard Enfield pattern.

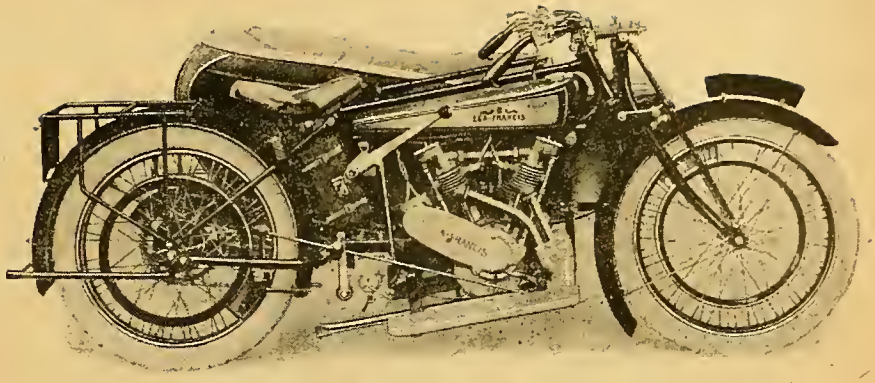
MOHAWK. (92.)

Touring Solo Lightweights.

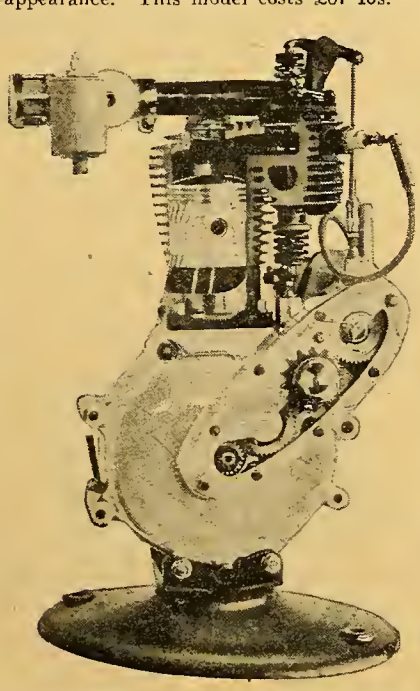
2¾ H.P. MODEL.—70×76 mm. (293 c.c.); single-cyl. four-stroke; side valves; hand pump lubrication; B. and B. carb.; chain-driven mag.; 2-sp. gear; clutch and kick-starter; chain and belt drive; 26×2¼in. tyres. Price £58.

THE MOHAWK CYCLE CO., Alexandra Road, Hornsey, and Coventry.—Mohawk models meet the demand for substantial and conventional machines built up from well-known and tried proprietary units, which are to be marketed at a moderate price. The equipment of the lightweight machine as a practical touring mount is sufficiently complete, with comfortable aluminium footboards, and the riding position and shape of the handle-bars are such, in the case of the standard model, as to appeal to the steady middle-aged type of rider. The machine is fitted with Brampton forks and Sturmey Archer two-speed gear box, with a simple and practical means for adjusting the driving chain from the engine to the countershaft.

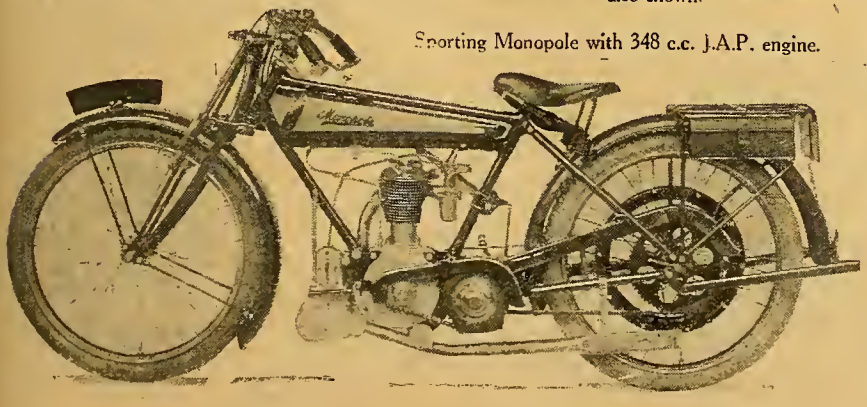
A 770 c.c. J.A.P.-engined model is also staged, fitted with Sturmey-Archer three-speed gear box and all-chain drive. This is listed at £105. The sports model is fitted with 346 c.c. J.A.P. engine, and differs from the lightweight in having chain drive throughout. The frame is somewhat longer, and the machine presents a racy and attractive appearance. This model costs £67 10s.



Standard touring 592 c.c. Lea-Francis sidecar outfit.



A sectioned engine of the 499 c.c. type on the Rudge stand. The firm's twin engine is also shown.



Sporting Monopole with 348 c.c. J.A.P. engine.

MONOPOLE. (37.)

Five 350 c.c. Solos.

3 H.P. MODEL.—70×90 mm. (346 c.c.); single cyl. four-stroke; side valves; hand pump lubrication; B. & B. carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2¼in. tyres. Price: Solo, £69 10s.; with sidecar, £85 5s.

MONOPOLE CYCLE AND MOTOR CO., LTD., Coventry.—Five Coventry-built machines, none exceeding 350 c.c., are staged. Various proprietary units—Villiers or J.A.P. engines and Sturmey-Archer gearboxes—are employed and generally speaking the machines do not differ greatly from last year's models. Chain transmission on the 348 c.c. semi-sporting model detailed above is, however, an innovation. It is neatly carried out, transmission shocks being absorbed by the cushion arrangement in the Sturmey gearbox. All the Monopole machines are finished in a soft shade of green, which, particularly on the sidecar model, looks quite attractive. The sidecar itself is a lightweight sporting Grindlay.

Another 348 c.c. solo mount uses final belt drive, when the price is £67 5s.

A single-geared 247 c.c. Villiers-engined lightweight at £40, and a 293 c.c. J.A.P.-engined model with a two-speed gear, clutch and kick-starter, at £58, complete the exhibit.

VELOCETTE. (129.)

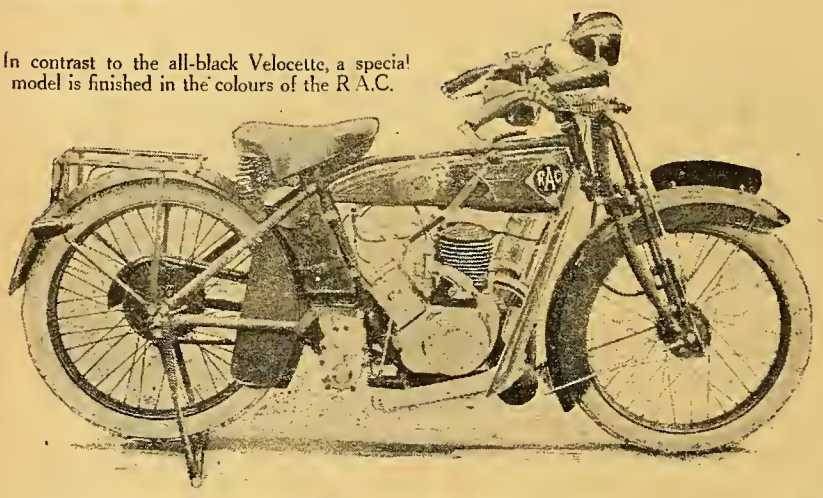
Mechanically-oiled Two-stroke.

2½ H.P. MODEL.—63×80 mm. (249 c.c.); single cyl. two-stroke; mechanical lubrication; B. and B. carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 24×2¼in. tyres. Price £65.

VELOCE, LTD., Aston Manor, Birmingham.—The Velocette engine has undergone radical alterations, and substantial advances have been made in respect of power output, silence, and balancing. The chief outward indication of these improvements lies in the exhaust system, twin pipes emerging from each side of the cylinder near its base, and leading into a large transverse silencer. Great pains have been taken to make all the joints in the exhaust system both sound- and oil-proof. The public performances of this engine proved that in its old form it was exceptionally efficient; next year both its power output and its road manners will display further improvement. The remainder of the machine remains practically unchanged, though the new exhaust pipes have en-

The Olympia Show.—

In contrast to the all-black Velocette, a special model is finished in the colours of the R.A.C.



forced alteration of the oil filler to a more convenient pattern. The weight of the three-speed model is still well under 180 lb., the two-speed model being proportionately lighter. The sports model is fitted with a close ratio gear box. The engine of the latest machine is a development of the 1922 type of racing unit.

Although Velocettes are not sold as all-weather-finish models, they are practically clear of any plated parts near the ground line, and on the touring pattern very neat aluminium leg shields can be fitted in conjunction with the footboards.

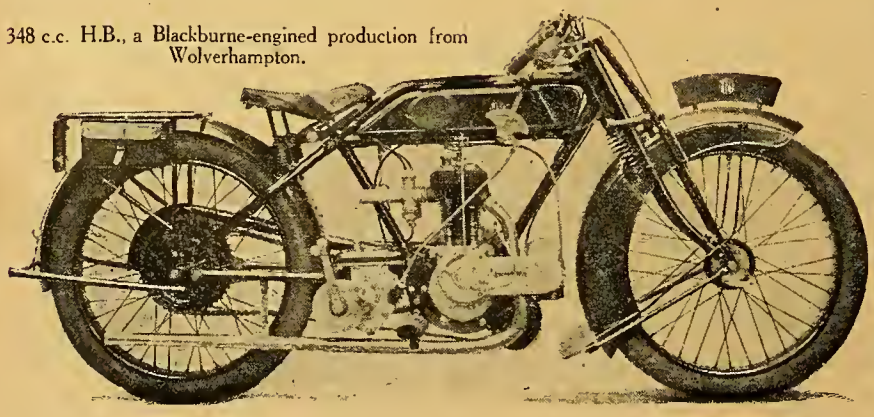
H.B. (121.)

Refined 350 c.c. Solo Models.

2¾ H.P. MODEL.—71×88 mm. (348 c.c.); single cyl. four-stroke; side valves; mechanical pump lubrication; Amac carb.; chain-driven magneto; 3-sp. gear; clutch, no kick-starter; chain drive; 650×50 mm. tyres. Price: Solo, £78; with Sidecar, £98.

HILL BROS., Wolverhampton.—The H.B. machine is designed as a *de luxe* member of the 350 c.c. class, in which no risk is run of spoiling the layout by a cut price or undue weight reduction. The finish and components are of the highest class throughout. Three models are manufactured, all with Blackburne engines. The sports model is obtainable with either the side valve or the o.h.v. unit. The silencer system is worth attention. At first sight it looks like a plain straight-through pipe, but the gases are actually conducted through an expansion chamber which is very rigidly mounted in front of the crank case. The effect is that the long pipe is far more stable than usual. The primary chain adjustment is exceptionally neat. The latest type of John Bull knee grips are screwed into sockets provided on the tank. A Webb front brake and the new model Best mechanical pump are attractive features. The wheel base is 51½in., which should provide good comfort and stability.

348 c.c. H.B., a Blackburne-engined production from Wolverhampton.



EDMUND. (138.)

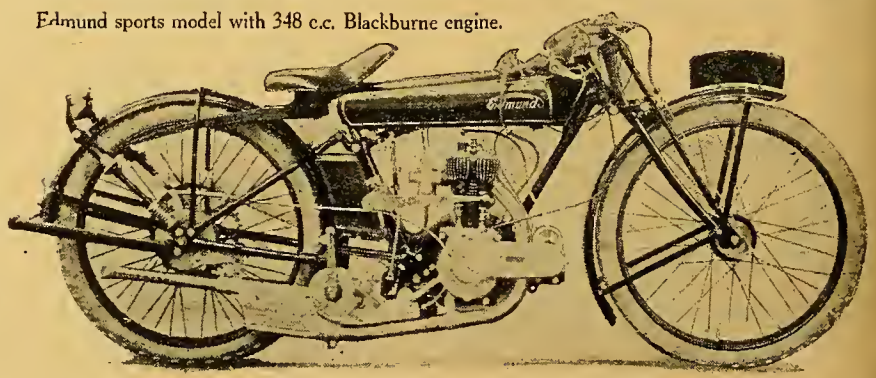
Super Suspension for the Rider.

2¾ H.P. MODEL.—71×88 mm. (348 c.c.); single-cyl. four-stroke; side valves; drip feed lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2¼in. tyres. Price: Solo, £78 15s.; with Sidecar, £97 5s.

C. E. EDMUND AND CO. (1920), LTD., Milton Works, Milton Street, Chester.—Edmund machines are, of course, famous as pioneers in the movement to provide increased comfort for the rider. The machines have been manufactured substantially in their present form for many years past. For 1923 three models are offered, namely, touring, sports, and super-sports, all of which are normally fitted with Blackburne engines, overhead valves being utilised on the super-sports type. Options consist of a Barr & Stroud engine on the touring model, or a special J.A.P. engine on the sports model. The policy of the firm is to offer 350 c.c. machines of the best quality, distinguished by the comfort bestowed by the patent frame. Several minor alterations of interest are to be noticed. The cast aluminium chain guards are exceptionally neat. Customers may choose either a sprung or rigid carrier. A large armoured toolbag is fitted to the tourist model. The sports model carries its expansion box in the modern fashionable position level with the rear wheel; this box is of excellent pattern, being of rectangular shape made in cast aluminium and very heavily ribbed in order to cool the gasses as far as possible.

Ribbed silencer of cast aluminium is used on the Edmund.

Edmund sports model with 348 c.c. Blackburne engine.



The Olympia Show.—

HARLEY-DAVIDSON. (34.)

Big American Twins.

9.89 H.P. MODEL.—84.1×88.9 mm. (989 c.c.); V twin cyl. four-stroke; overhead inlet valve; mechanical lubrication; Schebler carb.; gear-driven mag.; 3-sp. gear; clutch and kick-starter; all chain drive; 28×3in. tyres. Price: With Sidecar, £139 15s. (with full electric equipment).

HARLEY-DAVIDSON MOTOR CO., LTD., 74, Newman Street, London, W.1.—Although several improvements have been made to the standard Harley-Davidson sidecar outfit, the chief point of interest is undoubtedly the new price. In past years American machines have not unnaturally tended to cost appreciably more than British products in the same class; for next year the Harley compares favourably with anything else in the building on a price basis alone, and its reputation for power and speed places it in a high position among the big twin sidecar outfits.

Detail improvements have been made in the mechanical oil-pump (now a detachable unit), in the fork springing (now embodying double the number of springs), in the weather-proofness of the rear hubs, and even in such a comparatively insignificant items as the suspension of the rear lamp.

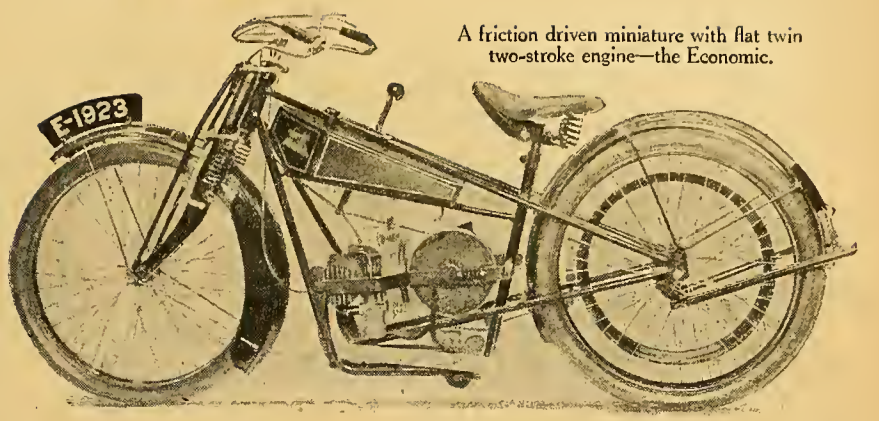
Conforming to the same specification generally is the "oversize" 1,208 c.c. model shown solo at £120, and with a new two-seater sidecar and full electric equipment at £157 5s.

Acetylene equipped touring and exceedingly attractive sporting 989 c.c. outfits are also on view at £135.

5.84 H.P. MODEL.—69.8×76.2 mm. (584 c.c.); flat-twin cyl. four-stroke; side valves; mechanical lubrication; Schebler carb.; gear-driven mag.; 3-sp. gear; clutch and kick-starter; gear and chain drive; 26×3in tyres. Price: Solo, £105.

Interesting as representing the American ideal of a "light" solo machine as well as for its proved silky running and controllability, the flat-twin Harley is little altered. Only one example is staged, and here again full electrical equipment, including horn, is supplied for the moderate price stated.

On the electrical Harleys the magneto is dispensed with entirely.



A friction driven miniature with flat twin two-stroke engine—the Economic.

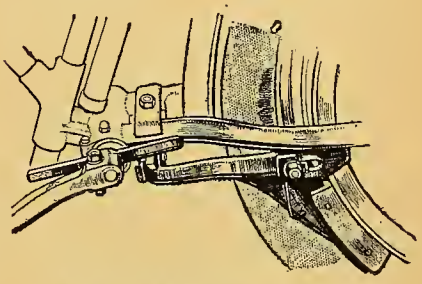
ECONOMIC. (45.)

Friction-driven Miniature.

2 H.P. MODEL.—52.5×38.5 mm. (165 c.c.); flat twin cyl. two-stroke; petroil lubrication; own make carb.; flywheel mag.; variable-sp. gear; no clutch or kick-starter; friction and belt drive; 26×2¼in. tyres. Price £28 17s.

THE EYNSFORD ENGINEERING CO., LTD., Primrose Works, Eynsford, Kent.—The Economic miniature has frankly been designed and built down to a price, but the fact that it has survived the handicap of a necessarily none too superfine external finish proves that it is quite a practicable vehicle. For next year this finish has been much improved, being now the more conventional black instead of red. It is notable as employing the only flat-twin two-stroke engine on the market, which incidentally is of the very simplest construction. The friction drive provides a wide range of gears, and also enables the overall weight of the machine to be kept down to 115 lb. This despite the fact that a duplex frame is employed. Its greatest achievement was an A.C.U. observed ride from London to Edinburgh at an average running speed of 17 m.p.h.

A light delivery model has a box carrier over the rear wheel.



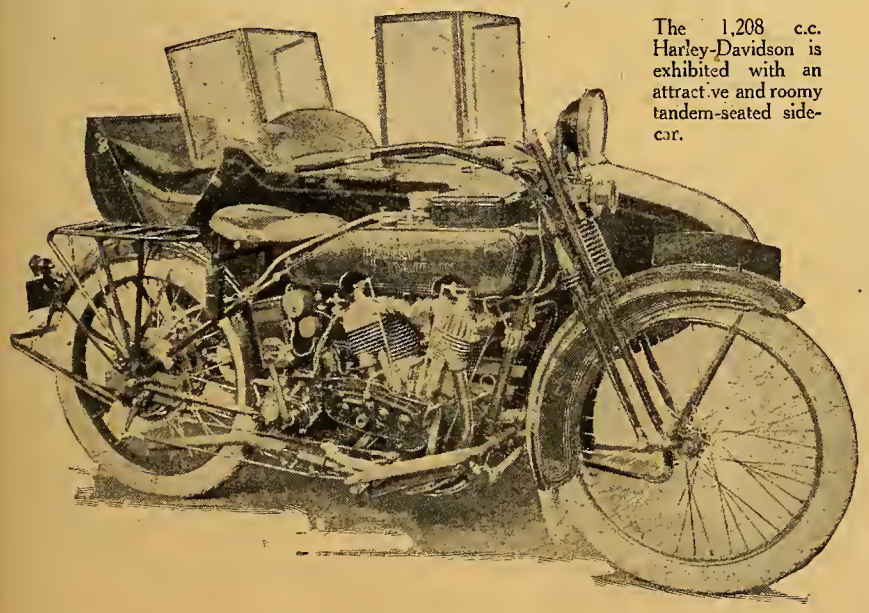
Rear brake operation on the McKenzie.

HENDERSON. (123.)

Four Cylinders, Three Speeds and Reverse.

11.5 H.P. MODEL.—68.3×89 mm. (1,301 c.c.); four cyl. four-stroke; side valves; mechanical lubrication; Zenith carb.; gear-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 27×3½in. tyres. Price: Solo, £137; with Sidecar, £163 5s.

MELCHIOR, ARMSTRONG AND DESSAU, 15, Newman Street, London, W.1.—The four-cylinder Henderson has gradually developed during late years into one of the most compact and luxurious machines on the road. The principal alterations of this elaborate layout consist of additional finning over the exhaust ports; as each port was already provided with a separate branch pipe over 12in. in length, there is no doubt about the efficiency of the scavenging. The transmission has been further silenced by the incorporation of a spiral bevel in the primary drive to the gear box. Lubricators are now fitted to both hubs. The Coupette sidecar is one of the handsomest and cosiest in the Show. A curved three-ply hood, with talc side windows, is hinged to disappear completely into the body at will. When raised, it joins a one-piece three-sided celluloid windscreen, so that the interior is completely windproof. The Henderson is the only motor cycle at the Show offered with a reverse gear; it is an optional addition.



The 1,208 c.c. Harley-Davidson is exhibited with an attractive and roomy tandem-seated sidecar.

The Olympia Show.—

HAZLEWOOD. (130.)

Medium-weight Passenger Models.

5-6 H.P. MODEL.—70×88 mm. (650 c.c.); V twin cyl. four-stroke; side valves; drip lubrication; Amac or B. and B. carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain-belt drive; 650×65 mm. tyres. Price: with Sidecar, £110.

HAZLEWOOD'S, LTD., Coventry.—The 650 c.c. Hazlewood is only marketed as a sidecar outfit, but it is offered in four different models at remarkably low prices. With a tradesman's carrier body, or as a tourist machine with chain-cum-belt drive, it almost touches bottom in price where an engine of its power is concerned. The touring model with all-chain drive and the sports edition are fractionally more expensive. Features of special interest on these machines are a spring seat pillar, a very substantial shock-absorber for the all-chain drive, and the internal expanding rear brake.

2¾ H.P. MODEL.—70×90 mm. (346 c.c.); single cyl. four-stroke; side valves; drip lubrication; B. and B. or Amac carb.; chain-driven mag.; 2-sp. gear; clutch and kick-starter; chain and belt drive; 26×2¼in. tyres. Price: Solo, £75.

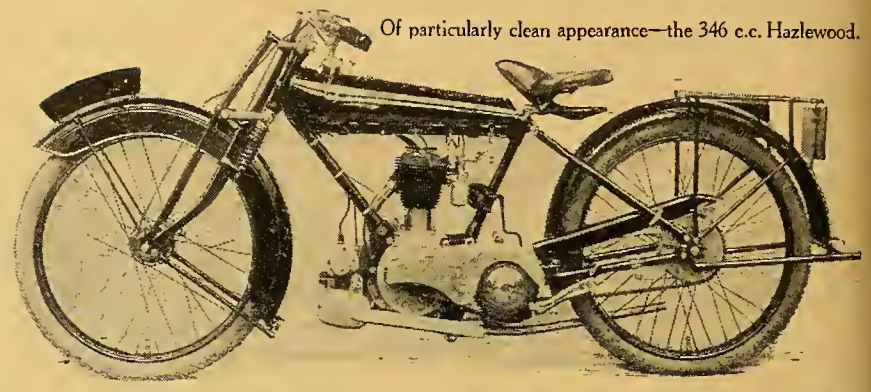
The 346 c.c. model has excellent chain guards and an unusually roomy expansion box for the exhaust. A J.A.P. engine is fitted, and three speeds and all-chain drive can be had if desired.

HUMBER. (126.)

Flat Twin and New Solo Single.

2¾ H.P. MODEL.—75×79 mm. (349 c.c.); single cyl. four-stroke; side valves; drip feed lubrication; Amac carburetter; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2¼in. tyres. Price £55.

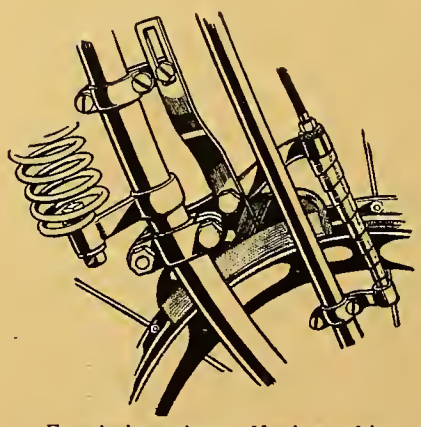
HUMBER, LTD., Coventry.—The new Humber lightweight is a superbly finished example of its class, conspicuous for a very heavily finned cylinder and clean aluminium castings. Points of interest are the enclosed kick-starter, large quickly detachable clutch cover, Brampton spring chain, and Webb front brake. Black all-weather finish is optional on all Humber machines without extra charge, and these models display the absolute minimum of bright parts. The exhaust system on the 349 c.c. model is interesting; a long pipe leads to a cast aluminium expansion box behind the gear bracket, the rear end of this box being reduced towards the final exit.



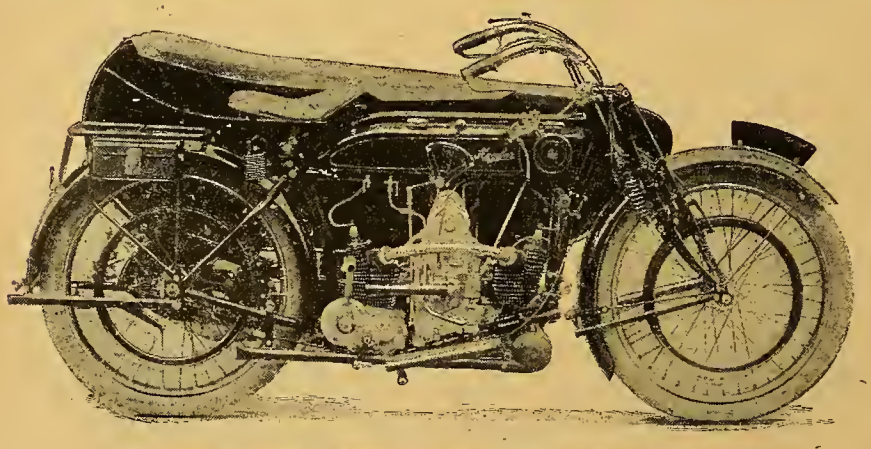
Of particularly clean appearance—the 346 c.c. Hazlewood.

4½ H.P. MODEL.—75×68 mm. (600 c.c.); twin cyl. four-stroke; side valves; mechanical lubrication; Claudel-Hobson carburetter; gear-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 650×65 mm. tyres. Price: Sports, £89; Touring, £99; with Side car, £105 and £120 10s.

For 1923 the flat twin engine has undergone no substantial alteration, although certain detail changes have been made in the lubrication system. The stirrup brake has been eliminated from the touring model, and with the substitution of a front belt rim brake both wheels are now interchangeable. This alteration has naturally led to a broader front fork and 6in. mudguards. The stirrup brake, narrow fork and guards are still retained on the sports model. The price of the latter, inclusive of a doorless Grindlay sidecar, is noteworthy.



Front brake on the new Humber model.



The smooth running and elegant-looking 600 c.c. Humber sidecar outfit.

HAWKER. (36.)

Dual-purpose Big Single.

4 H.P. MODEL.—85×96 mm. (545 c.c.); single cyl. four-stroke; side valves; drip feed lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 700×80 mm. tyres. Price: Solo, £85; with Sidecar, £105.

H. G. HAWKER ENG. CO., LTD., Canbury Park Rd., Kingston.—The largest of the Hawker models has been completely re-designed for next year and is now an excellent example of the more substantially-built dual-purpose big single. 700×80 mm. tyres are fitted, and the rest of the machine is in proportion. It is not, however, in any way a cumbersome-looking design.

It has internal expanding brakes front and rear.

One model shown is completely equipped, including the new B.T.H. mag-generator lighting set, which is very neatly carried.

2½ H.P. MODEL.—70×76 mm. (293 c.c.); single cyl. two-stroke; sump lubrication; Amac carb.; flywheel mag.; 2-sp. gear; no clutch or kick-starter; chain and belt drive; 26×2⅜in. tyres. Price: Solo, £39 8s.

Neatness is the keynote of the Hawker two-stroke, which, it may be recalled, earned considerable fame by hauling a sidecar up 5-mile-long Tornapress in the 1921 Scottish Six Days Trials.

Its unusual features are a detachable cylinder head and a simple system of automatic lubrication. The way in which

Over 350 photos and drawings are used to illustrate this greatly enlarged

SHOW REPORT NUMBER

of

THE MOTOR CYCLE

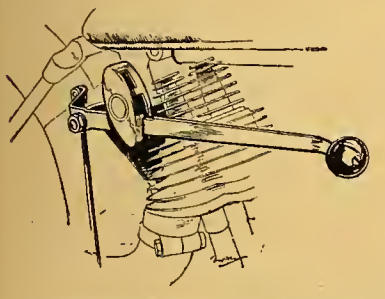
It is an issue worthy of preservation for reference purposes.

The Olympia Show.—

both its brakes work on the rear belt rim also is not too common.

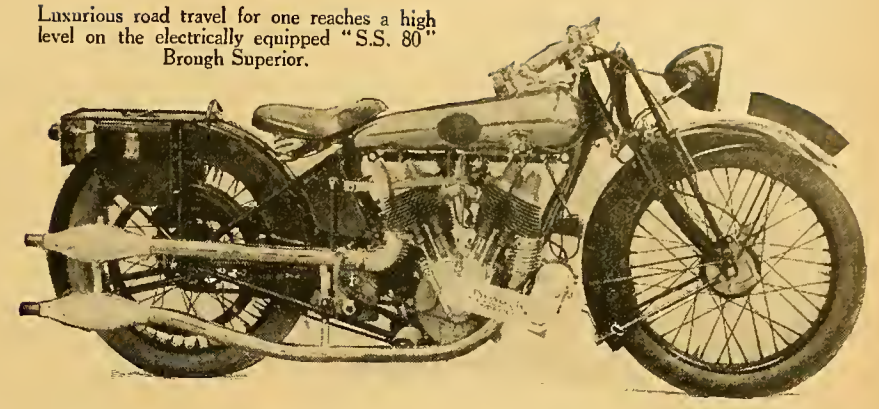
The flywheel magneto may be used to supply lighting current.

In between the two extremes specified are 250 c.c. and 350 c.c. side-valve and 350 c.c. o.h.v. Blackburne-engined models at £70, £72 10s., and £84 respectively. All three have chain drive and Burman three-speed gear boxes.



New Sturmey Archer gear quadrant on the Brough Superior.

Luxurious road travel for one reaches a high level on the electrically equipped "S.S. 80" Brough Superior.



BROUGH SUPERIOR. (89.)

Super-Sports Big Twins.

8 H.P. MODEL.—85.5×85 mm. (976 c.c.); V twin cyl. four-stroke; side-by-side valves; drip feed lubrication; Binks carb.; chain-drive mag.; 3-sp. gear; clutch and kick-starter; chain drive; 700×80 mm. tyres. Price: Solo, £150; with Sidecar, £184.

GEORGE BROUGH, Haydn Road, Nottingham.—One would have thought it impossible to add any further refinements to the "S.S.80" Brough Superior. Yet this Rolls-Royce of motor cycles—it earns the title by something more than mere cost—has been further improved since it made its first (and very successful) appearance in the Six Days Trials. Attention has been devoted in the main to details. The lower torque tubes now extend from the rear axle to the rear engine plate, passing inside instead of outside the exhaust pipes; knee grips are carried on concealed clamps on the tank; and the exhaust pipes fixing has been cleaned-up. When a Magdyno is fitted (£15 extra) the details are carried out in a wonderfully neat fashion, embodying the latest switch and lamp brackets integral with the forks. The way in which the fully-equipped model camouflages its equipment is remarkable. The handlebars are clear except for a speedometer right in the centre. For £160 the "S.S.80" model is supplied with a guarantee to have exceeded 80 m.p.h. on the track.

A new sidecar has been designed to suit the machine. Despite attractive sporting lines, it is extremely roomy and comfortable, being upholstered with "Buoyant" cushions of spring-mattress fame.

Also in the 1,000 c.c. class are the side-valve and o.h.v. models, both at £130, and finally there is the 740 c.c. M.A.G.-engined machine, which is a replica of the "S.S.80," but somewhat less of a road-eater. Its price is £115, or with full equipment £125; and a specially finished sporting Montgomery sidecar is sold for it at £27.

CYKELAID. (158.)

For Motorising Bicycles.

1½ H.P. MODEL.—55×56 mm. (133 c.c.); single cyl. two-stroke; petroil lubrication; Amac carb.; flywheel mag.; clutch, no kick-starter; chain drive; 26×2in. tyres. Price £24 10s.

SHEPPEE MOTOR CO., LTD., Thomas Street, York.—In its latest form the Cykelaid motor-assisted bicycle is far more workmanlike in design than such machines have been in the past.

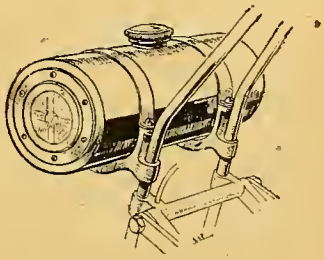
The little power unit fits very neatly to a special front wheel with the petrol tank above the mudguard, motor cycle type spring forks, and the silencer actually bolted to the mouth of the exhaust ports. Control is limited to a single-lever carburetter, and the whole of the mechanism is as simple as possible. Two ladies' and two gentlemen's machines are shown, one of each type being provided with a substantial motor cycle type carrier, and all with the motor cycle type stand.

CLEMENT. (181.)

Only 43 c.c. Capacity.

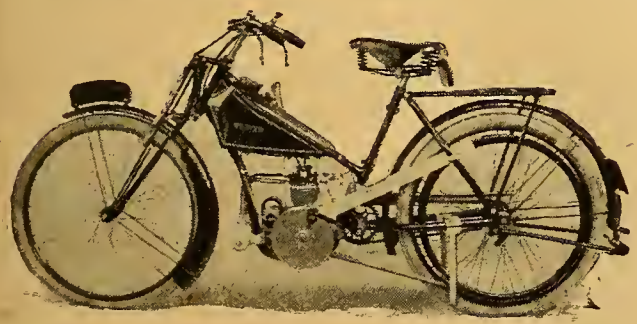
¾ H.P. MODEL.—35×45 mm. (43 c.c.); single cyl. four-stroke; overhead valves; splash lubrication; gear-driven mag.; single-sp.; chain drive; 28×1¾in. tyres. Price £24 3s.

A. CLEMENT, 26, Albany Street, London, N.W.1.—The smallest engine in the Show is fitted to this motorised bicycle,

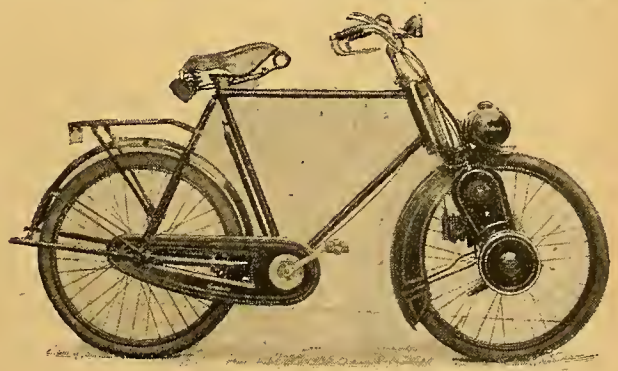


The licence holder on the Cykelaid is accommodated in the end of the tank.

a Belgian design assembled in this country. The cylinder is an exact model of that on the Gnome aeroplane engine, and is a special attraction to model-makers. The machine itself is little more than a pedal cycle with a fork employing a leaf spring. That the engine is of the high-

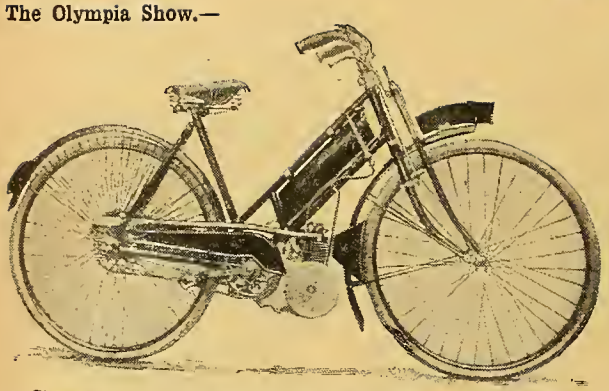


Overhead valves are not confined to sports models—the little Weaver lightweight has a miniature o.h.v. engine.



Cykelaid motor attachment for pedal cycles.

The Olympia Show.—



Clement 43 c.c. motorised bicycle—the smallest-engined machine at the Show.

speed type may be judged from the fact that the gear ratio is 12 to 1, with which it is capable of maintaining an average speed of 24.66 m.p.h. The makers hold an A.C.U. certificate showing that on an observed test covering 59½ miles this speed was accomplished, and also that the machine, with a 169 lb. rider, ascended Hindhead without pedal assistance. "Ten miles a penny" is one of the claims made by the manufacturers. A lady's model is also shown, and is priced at one guinea extra. A special racing model is also on view, with dropped handlebars and wooden rims. Its weight complete is but 38½ lb.

Connaught silencer cut away to show arrangement of exit pipes.

CONNAUGHT. (132.)

Solo and Sidecar Two-strokes.

2¾ H.P. MODEL.—73×70 mm. (293 c.c.); single cyl. two-stroke; petroil lubrication; Amac or B. and B. carb.; chain-driven mag.; 2-sp. gear; clutch and kick-starter; chain and belt drive; 24×2¼in. tyres. Price £49 7s.

BORDESLEY ENG. CO., Aston, Birmingham.—The foundation of this model is the familiar Connaught engine on which the reputation of the firm has been built. It is famous for economy, both in petrol and oil, and is marketed with three separate transmission specifications, viz., popular (direct belt drive), standard (chain-cum-belt), and all-weather model (all chain). The geared models are definitely recommended for pillion work. A glance at the machines indicates that silence is going to be a special feature during 1923, it being obvious that very special attention has been paid to the exhaust system.

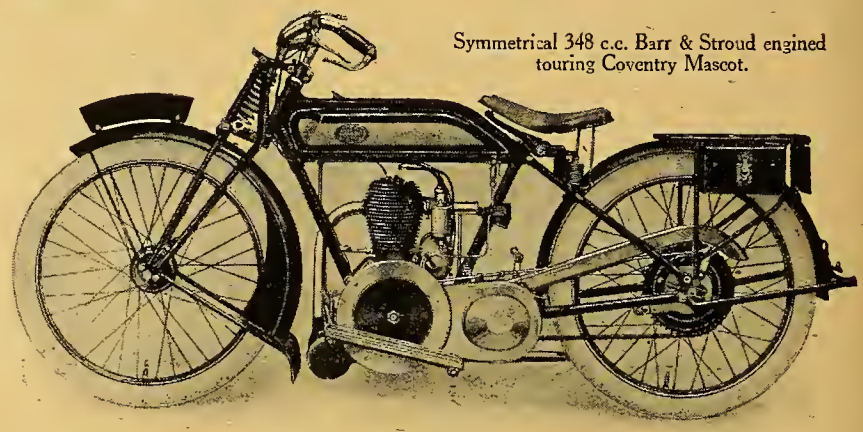
3½ H.P. MODEL.—76×77 mm. (349 c.c.); single cyl. two-stroke; mechanical pump and petrol lubrication; Amac or Wex carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2¼in. tyres. Price: Solo, £65 2s.; with Sidecar, £78 15s.

The silencing arrangements of both the sports and the *de luxe* models are worth close attention. The exhaust of the *de luxe* model emerges from the cylinder into a finned aluminium manifold, and passes down a huge flexible copper pipe into a capacious aluminium expansion box under the engine, from which the exit is by twin copper fishtails. On the sports model, which has a similar engine, the exhaust emerges from the cylinder into a duplex aluminium manifold, from which it travels down a big copper pipe to an aluminium expansion box level with the rear wheel. The capacity of these systems, and the use of special metals to cool the gas and to prevent "ring," are noteworthy points.

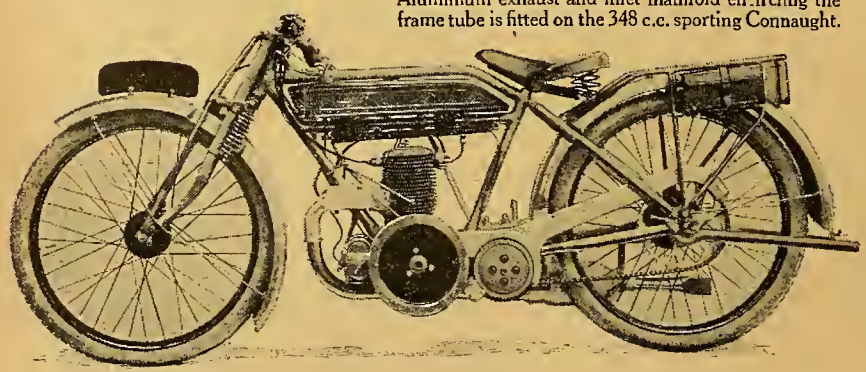
This 348 c.c. engine is, of course, large as two-strokes go. On the sports model it is capable of 55 miles per hour, whilst the *de luxe* model with a low bottom gear makes a powerful touring mount. Each model is fitted with a Showell mechanical pump. Petroil lubrication is used as an auxiliary. The handle-bar adjustment in the head clip deserves attention.

Equipped with quite a roomy and substantial sidecar the three-speed model has ample power and is sufficiently robustly built for transporting two people anywhere.

Symmetrical 348 c.c. Barr & Stroud engined touring Coventry Mascot.



Aluminium exhaust and inlet manifold encircling the frame tube is fitted on the 348 c.c. sporting Connaught.



COVENTRY-MASCOT. (124.)

Sleeve Valve or o.h.v. Oil-cooled.

2¾ H.P. MODEL.—70×90 5 mm. (348 c.c.); one cyl. four-stroke; sleeve valves; hand pump lubrication; Vici carb.; gear-driven mag.; 2-sp. gear; clutch and kick-starter; chain and belt drive 26×2¼in. tyres. Price: Solo, £67; with Sidecar, £87.

COVENTRY MASCOT CYCLE CO., LTD., Camden Street, Coventry.—These machines are of thoroughly conscientious design and form a very nice housing for the Barr and Stroud engine. The front down tube is duplex in order to give the necessary clearance for a straight exhaust pipe. The steering head is an excellent mechanical job, its inner curve being struck to a true radius without corners. All fittings are brazed. Very sensible footboards are fitted, and both the brakes are of the Webb type. Various transmission options are given. One model has a tremendous expansion box with the tail pipe carried up to the level of the pannier bag for the purpose of negotiating water splashes.

2¾ H.P. MODEL.—68×96 mm. (349 c.c.); one cyl. four-stroke; overhead valves; mechanical lubrication; Amac carb.; gear-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2½in. tyres. Price: Solo, £69; with Sidecar, £89.

This model is fitted with the new vertical single cylinder oil-cooled Bradshaw engine, equipped with overhead valves and mechanical lubrication. The frame and riding position are of the sports type, and as this engine has a high efficiency the machine is decidedly attractive.

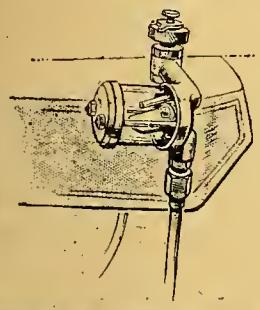
The Olympia Show.—

J.E.S. (38.)

Four-speed 150 lb. Lightweight.

2½ H.P. MODEL.—68×68 mm. (247 c.c.); single cyl. two-stroke; automatic lubrication; Amac carburetter; chain-driven mag.; 4-sp. gear; clutch and kick-starter; chain drive; 26×2¼in. tyres. Price, £59 17s.

J.E.S. MOTOR CO. (GLOUCESTER), LTD., Gloucester.—This year's Six Days Trials demonstrated that the 169 c.c. J.E.S. with four-speed gear box was a go-anywhere machine; there should therefore be no doubt as to the capabilities of the new 247 c.c. model which forms the chief exhibit.

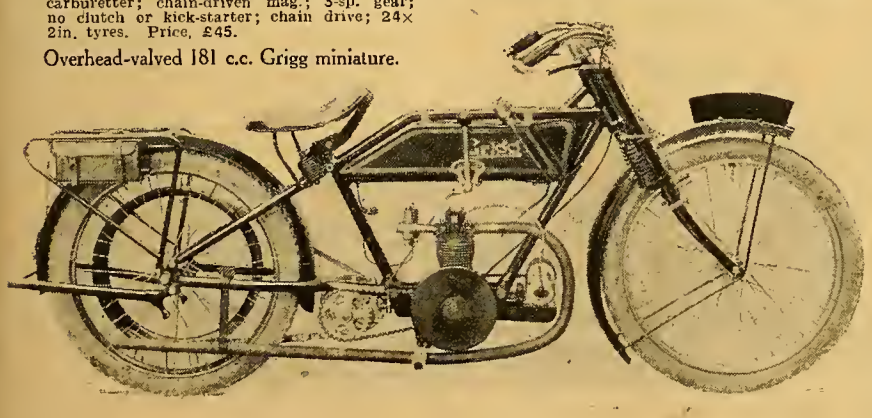


Adjustable oil drip-feed on the J.E.S.

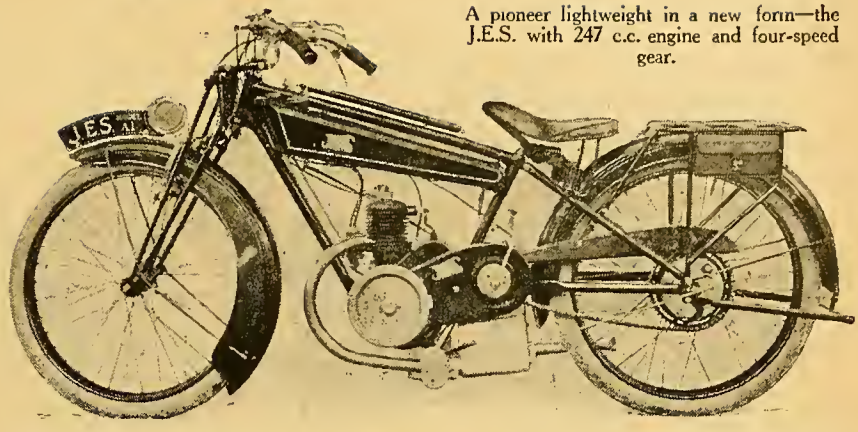
The gear box is the same as was used on the smaller model in the A.C.U. Trials, but the engine is a new production, although on quite conventional lines. It is of the three-port type, and has a roller-bearing big end. Lubrication is by crank case pressure controllable by an adjustable drip feed. Special attention has been paid to balance. Quite a novel principle—for motor cycles—is applied in the diminutive four-speed gear box. The pinions are in constant mesh, and each pair in turn is dogged to the main- and lay-shafts. Thus the drive on each gear is indirect. Similar designs are often employed in machine tools. Other important features include a massive internal expanding rear brake, a slightly smaller front brake, and girder spring forks. Transmission is by chain, and there is a shock absorber in the rear hub. Complete, this workmanlike little motor cycle weighs only 150 lb.

1¾ H.P. MODEL.—60×60 mm. (169 c.c.); single cyl. two-stroke; automatic lubrication; Amac carburetter; chain-driven mag.; 3-sp. gear; no clutch or kick-starter; chain drive; 24×2in. tyres. Price, £45.

Overhead-valved 181 c.c. Grigg miniature.

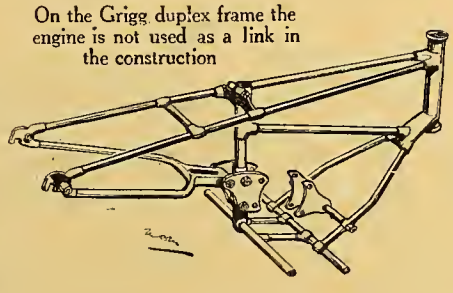


A pioneer lightweight in a new form—the J.E.S. with 247 c.c. engine and four-speed gear.



The 169 c.c. miniature is shown in two forms, with direct belt drive at £29, or to the above specification with a new three-speed gear box and final chain drive at the price stated. In the first case a belt rim rear brake is employed, but on the more elaborate model the internal expanding type, as on the 247 c.c. machine, is repeated.

On the Grigg duplex frame the engine is not used as a link in the construction



GRIGG. (35.)

Duplex Frame Construction.

3½ H.P. MODEL.—79×70 mm. (343 c.c.); single-cyl.; two-stroke; drip feed lubrication; Amac carb.; flywheel mag.; 3-sp. gear; clutch and kick-starter; chain and belt drive; 26×2¼in. tyres. Price with Sidecar, £72 10s.

THE GRIGG MOTOR AND ENG. CO., LTD., St. Margaret's, Twickenham, London.—Probably the most interesting of the many varied Grigg lightweights is the 343 c.c. Villiers-engined sidecar outfit. It is one of the most compact, and incidentally most moderately priced, passenger machines in Olympia. The chief feature of this, and of all the other little Griggs, is a neat triangulated frame, duplex in some places. Otherwise they employ well-known proprietary components, except for the smallest model, which has the 64×62 mm. (199 c.c.) Grigg two-stroke engine. Two speeds are fitted to this, and to the 247 c.c. and 347 c.c. Villiers-engined solo models, which cost respectively £42 10s., £49, and £55. A 349 c.c. Blackburne engine is fitted to a new model, with chain drive and a three-speed gear box, at £73.

A late arrival on this stand was a miniature four-stroke, using the o.h.v. engine popular on many makes in this class. With two-speed and belt drive it costs £37 16s.

F.N. (141.)

Shaft Drive

8 H.P. MODEL.—52×88 mm. (748 c.c.); four cyl. four-stroke; overhead inlet valves; mechanical lubrication; Amac carb.; gear-driven mag.; 3-sp. gear; clutch and kick-starter; shaft drive; 26×3in. tyres. Price: Solo, £110; with Sidecar, £135.

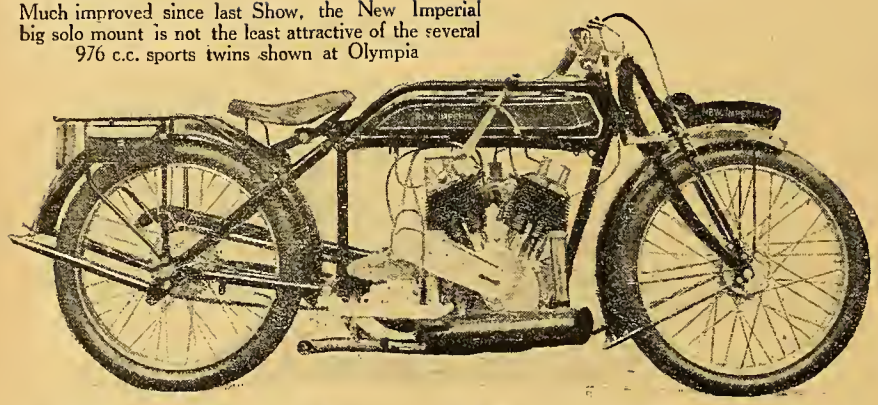
F.N. (ENGLAND), LTD., Kimberley Road, Willesden Lane, N.W.—The four-cylinder touring model F.N. remains entirely unchanged from last year, though several new sidecars have been added to the range, including a spring wheel model. This machine is now obtainable as a sporting model, the main feature of which is a specially-tuned engine which can be guaranteed to provide speeds exceeding 60 miles an hour; the saddle, footboards, and handle-bar of the sporting model have been modified to suit its speed.

2¾ H.P. MODEL.—65×85 mm. (282 c.c.); one cyl. four-stroke; overhead valves; drip feed lubrication; Amac carb.; gear-driven mag.; 2-sp. gear; clutch and kick-starter; shaft drive; 26×2½in. tyres. Price £60.

This veteran lightweight has undergone very little change, as might be expected from its long and honourable history. The front fork has been redesigned, and its links are now equipped with large ball bearings. A sight feed for the drip lubrication has been brought up level with the tank on the near side, where it is extremely convenient for observation. Scintilla magnetos will be fitted for 1923. The new saddle, which is of French origin, gives a low riding position, and the mudguards are wider than formerly.

The Olympia Show.—

Much improved since last Show, the New Imperial big solo mount is not the least attractive of the several 976 c.c. sports twins shown at Olympia



NEW IMPERIAL. (94.)

Solo Lightweights—Big Twin Sidecars.

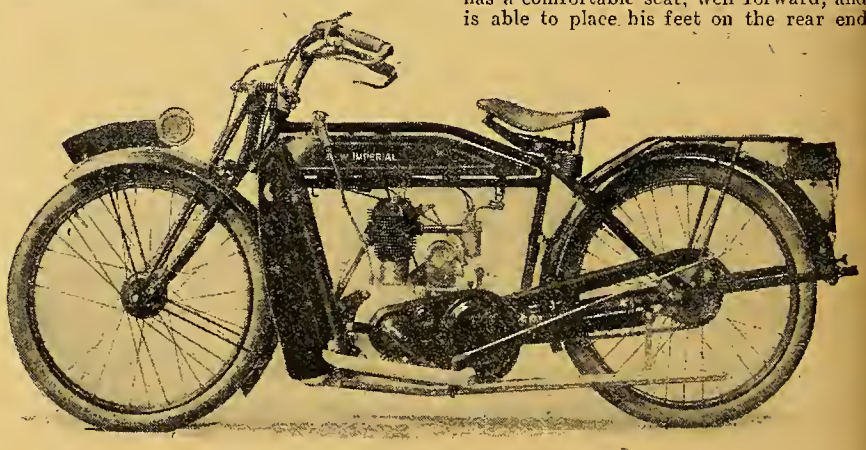
2½ H.P. MODEL.—70×76 mm. (293 c.c.); single cyl. four-stroke; side valves; drip feed lubrication; B. and B. carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter chain drive; 26×2¼in. tyres. Price £65.

NEW IMPERIAL CYCLES, LTD., Princip Street, Birmingham.—On the New Imperial stand are shown models designed to meet all tastes. From a light sporting machine of 248 c.c. with J.A.P. engine, the range extends up to a very complete and substantial outfit with 976 c.c. twin-cylinder J.A.P. engine. Interest centres round the standard 293 c.c. light touring machine which, with complete equipment, is marketed at an attractive price. This model has leg guards which are arranged in such a way as completely to protect the rider from any mud splashes that the front guard has failed to intercept, and so placed as to offer the minimum amount of wind resistance. In addition to the model with standard equipment, there is shown a machine fitted with the M-L Maglita set, which, with its accumulator and head lamp both clipped to the handle-bar, presents an appearance neat and by no means cumbersome.

8 H.P. MODEL.—85.5×85 mm. (976 c.c.); V-twin cyls. four-stroke; side valves; drip feed lubrication. B. and B. carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 28×3in. tyres. Price: Solo (super-sports) model, £117; (standard) with Sidecar, £125.

Many features of special interest are presented by the big sidecar machine. Brakes, for instance, are internal expanding car type on both front and rear wheels, and the hubs are fitted with Timkin roller bearings. The silencer is of remarkable dimensions, and will attract those who are specially desirous of a quiet machine. The carrier and back half of the rear mudguard are arranged so as to be very easily and quickly removable when access to the back tyre is desired. Amongst many other features, the provision of special grease lubricating caps at all vital points on the machine is notable. These caps are closed by spring loaded balls, and provided for the purpose, which screws on to them. The grease is forced in, and are filled by means of a special grease gun there can be no doubt whatever about its reaching the point at which it is required. Of course the chief change on this model, as already recorded in *The Motor Cycle*, is the new loop frame.

Mention should also be made of the substantial and practical light sidecar outfit fitted with a 350 c.c. J.A.P. single-cylinder engine and three-speed gear.



Medium weight 293 c.c four-stroke in the big range of New Imperial models.

H.T. (46.)

All-weather Runabout and Sports Solo.

2¾ H.P. MODEL.—70×90.5 mm. (348 c.c.); single cyl. four-stroke; sleeve valve; drip feed lubrication; Cox Atmos carb.; gear-driven mag.; 2-sp. gear; clutch and hand-starter; chain and belt drive; 26×2½in. tyres. Price £80.

THE H.T. MOTOR CYCLE CO., Park Street, near St. Albans, Herts.—Probably the old and fuller name of the H.T.—the Hagg Tandem—better describes this model, which is a two-seated two-wheeler designed to overcome the main objections to pillion riding. The extra passenger has a comfortable seat, well forward, and is able to place his feet on the rear end of the main footboards. It is claimed that the usefulness of the H.T. as a solo mount is not in any way diminished.

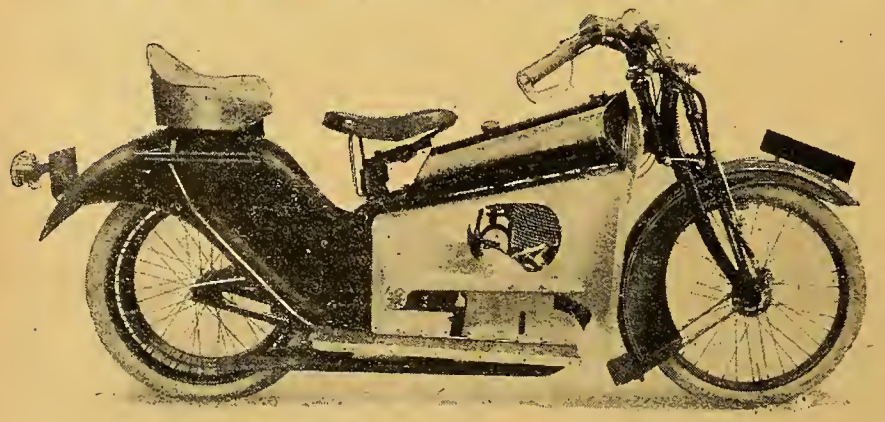
Other features of note are a simple but extremely strong spring frame, complete shielding of the engine, and adequate mudguarding, a hand-starter, and a foot-controlled gear, which allows the nervous rider to retain his hands on the handle-bars whenever the machine is in motion.

Provision has been made for carrying luggage pannier fashion over the rear wheel.

2¾ H.P. MODEL.—70×90.5 mm. (348 c.c.); single cyl. four-stroke; sleeve valve; drip feed lubrication; Binks carb.; gear-driven mag.; 2-sp. gear; clutch, no kick-starter; chain and belt drive; 26×2½in. tyres. Price £65.

Right at the other end of the scale is the second model of the H.T., a simple and light speed machine, shorn of all unessentials.

Internal expanding front and rear brakes are fitted to both types, and several other items in their specification are the same, but it would be difficult to imagine a greater contrast than the finished products.



Completely shielded and fully sprung tandem-seated model of the H.T.

The Olympia Show.—

P. & M. (77.)

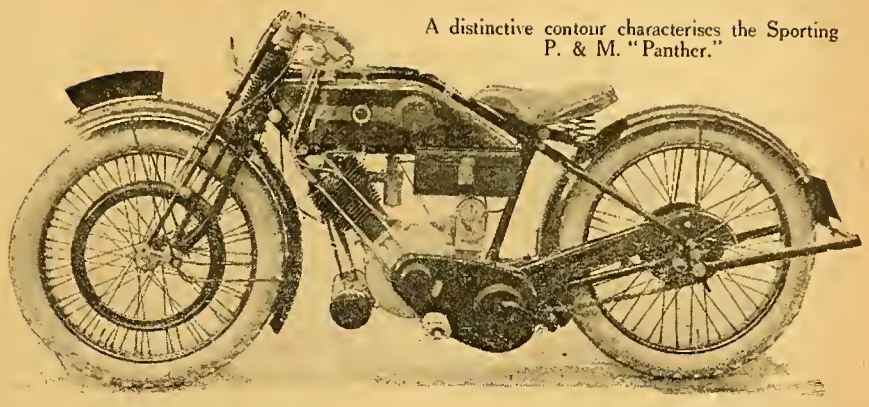
Tourist Mount Turns Speed Model.

4½ H.P. MODEL.—84.1×100 mm. (555 c.c.); single cyl. four-stroke; side valves; mechanical lubrication; B. and B. carb.; chain-driven mag.; 4-sp. gear; clutch and kick-starter; chain drive; 700×80 mm. tyres. Price: Sports solo, £100; Touring Sidecar (fully equipped), £136.

PHELON AND MOORE, LTD., 4, Berners Street, Oxford Street, W.1.—For many years the broad and distinctive lines of the P. and M. machine have been the same. Indeed, one familiar with the earlier models could, without hesitation, recognise the motor cycles on the stand as descendants in the direct line. The principal model for next year is the new sporting type of 555 c.c. capacity. This machine for the first time in the history of P. and M. is of really sporting character, with dropped handle-bars, a sloping tank, and a cut-away top tube to give an easy riding position. An aluminium piston is fitted, together with a special form of knee pad, rigidly fixed to the tank by a concealed clamp. In addition there is a new type of sidecar with an aluminium body, having a car type windscreen and a disappearing hood. This body resembles in many respects the Brooklands type of racing car body which has been so popular in the past season.

An ordinary sidecar is shown, together with two models, one solo and one sidecar, having Brooks cantilever leaf-spring saddles. The sporting models, of course, have an ordinary saddle.

The excellent finish of the machines calls for commendation; indeed, ever since this old-established firm specialised on the production of motor cycles these have been famed for quality. In view of the almost general adoption of variable gears and chain transmission this year, it is not without interest to observe that P. and M. machines from the earliest days have been thus equipped.



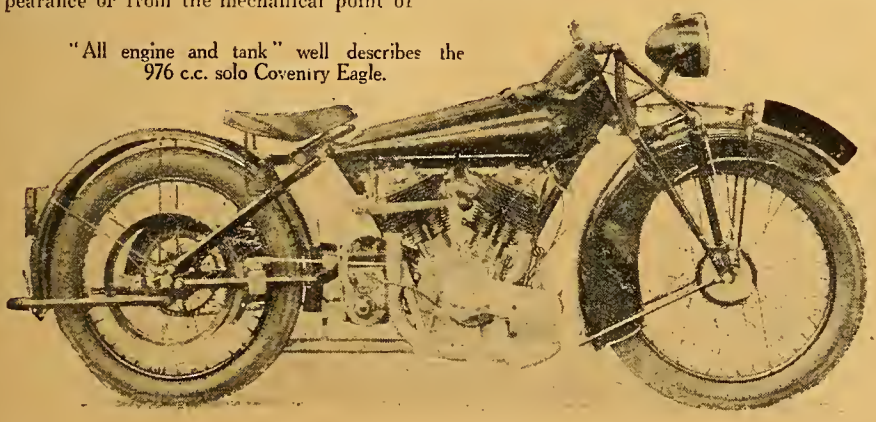
A distinctive contour characterises the Sporting P. & M. "Panther."

COVENTRY-EAGLE. (43.)

Small Singles; Big Sports Twin.

8 H.P. MODEL.—85.5×85 mm. (976 c.c.); V twin cyl. four-stroke; side-by-side valves; hand-pump lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 700×80 mm. tyres. Price: Solo, £125; with Sidecar, £145.

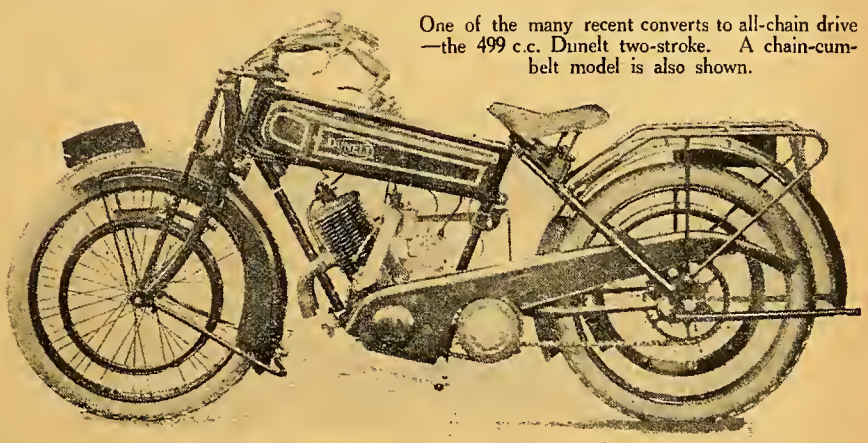
COVENTRY EAGLE CYCLE AND MOTOR CO., Coventry.—There are few machines in the Show that can compete with the latest big Coventry Eagle, either in appearance or from the mechanical point of view. It is a most imposing machine, yet compact and neat. Engine and gear box are well-known proprietary units—the super-sports J.A.P. and the Sturmey-Archer respectively—but it is the way in which they are housed that attracts attention. Incidentally, the engine plates are of a new pattern, employing two bolts instead of one where they are attached to the frame lugs, and of such a shape as to permit extremely short front down- and saddle-tubes. A very rigid assembly is the result. Montgomery spring forks, a large bull-nosed saddle tank, and a neat aluminium silencer are noteworthy features.



"All engine and tank" well describes the 976 c.c. solo Coventry Eagle.

3 H.P. MODEL.—70×90 mm. (346 c.c.); single cyl.; four-stroke; side-by-side valves; hand-pump lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2¼ in. tyres. Price: Solo, £67; with Sidecar, £86.

Known as the general utility model, the 346 c.c. J.A.P.-engined Coventry Eagle may be taken as representative of the wide range of light- and medium-weight machines staged. It again embodies well-tried proprietary components, but differs from the larger machine in having Brampton forks. To a sporting specification, using the sports edition of the same engine, it costs £69 10s.



One of the many recent converts to all-chain drive—the 499 c.c. Dunelt two-stroke. A chain-cum-belt model is also shown.

Very similar is a 348 c.c. Blackburne-engined model at £65; while there are two workmanlike 249 c.c. Blackburne and 293 c.c. J.A.P. models, with two-speed, clutch and kick-starter, and final belt drive, both at £56.

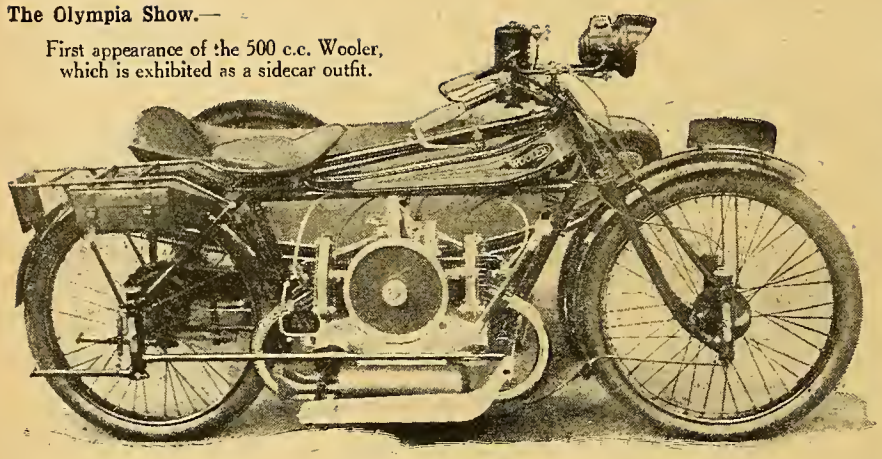
1¾ H.P. MODEL.—55×60 mm. (142 c.c.); single cyl. two-stroke; petroil lubrication; Amac carb.; chain-driven mag.; single gear; chain and belt drive; 26×2in. tyres. Price £30 9s.

The new miniature is one of the best-looking of its type in the Show. This quality is helped by the tank being a replica of that on the larger machines. The magneto-drive, from a sprocket alongside the engine sprocket, enables one cover to protect the primary and magneto drives. £33 12s. is the price of a two-speed model.

Finally, there is a sturdy but pleasing family sidecar outfit at £115, employing the 549 c.c. J.A.P. engine.

The Olympia Show.—

First appearance of the 500 c.c. Wooler, which is exhibited as a sidecar outfit.



WOOLER. (18.)

Overhead Camshaft Flat Twin.

2¾ H.P. MODEL.—60.5×60 mm. (345 c.c.); flat twin cyl. four-stroke; overhead valves; mechanical lubrication; B. and B. carb.; chain-driven mag.; 3-sp. gear; clutch, no kick-starter; gear and chain drive; 26×2¼in. tyres. Price £80.

DEDERICH WOOLER ENG. CO., LTD., Alperton, London.—Right from their inception, Wooler motor cycles have always tended to be unconventional, and many of their original features—for example, the simple system of front and rear suspension—are still retained on this, the latest model. The engine has been re-designed to give the greatest efficiency, and the valves, placed radially in the cylinder heads, are operated through rockers by a camshaft running parallel with the cylinders. A simple adjustment for taking up wear is provided. The method at first adopted of holding down the detachable head by an interrupted thread has been discarded, ordinary bolts now being used. Embodying a sump for the mechanical oil pump, the crank case also holds the three-speed gear. To adjust the driving chain the whole engine unit may be slid bodily forwards on its duplex carrying members. Internal expanding brakes front and rear, suitably-placed footrests, and well-dropped handle-bars make the specification of this model workmanlike. It also gives promise of considerable speed.

3½ H.P. MODEL.—66×73 mm. (499 c.c.); flat twin cyl. four-stroke; overhead valves; mechanical lubrication; B. and B. carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; gear and chain drive; 26×2¼in. tyres. Price: Solo, £94; with Sidecar, £109.

Although an entirely new model not previously seen or illustrated, the 499 c.c. Wooler follows the lines of the 345 c.c. model so closely that little additional description is required. Intended for solo or passenger work, it is shown with a very neat, low sidecar, finished to match the tank. Also shown are chain-driven three-speed and belt-driven variably-geared examples of the touring 345 c.c. model, little altered from last year. Solo the prices are £75 10s. and £65 respectively, or with suitable sidecars £95 10s. and £77 10s. A 1,000 c.c. Wooler engine embodying the new camshaft is also shown, but apparently it has been designed for use in a light car so many medium-weight machines; and, last, the Barr and Stroud single-cylinder sleeve-valve engine of 349 c.c. capacity. In each case the power plant is adapted in a remarkably neat and attractive manner. The Sturmey-Archer two-speed gear and Amac carburetter are fitted to machines with the Villiers and J.A.P. engines. A smaller model, also with Villiers engine, may be described as an ultra-lightweight machine. This is fitted with the Albion two-speed gear, and will appeal particularly to those who require a mount that is both substantial and tractable, whilst being at the same time really light.

3½ H.P. MODEL.—70×90.5 mm. (349 c.c.); one cyl. four-stroke; single-sleeve valve; sight feed lubrication; Amac carb.; chain-driven magneto; 3-speed gear; clutch and kick-starter; chain drive; 26×2¾ tyres. Price £77 10s.

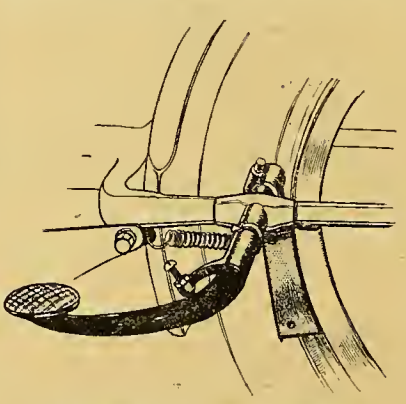
Probably the most interesting model on this stand is that fitted with the 349 c.c. Barr and Stroud sleeve-valve engine; it is chain-driven throughout. The magneto is an M.L., and a Sturmey-Archer three-speed gear is employed. The brake work is well carried out, dummy belt rims being fitted on both front and rear wheels. Altogether this is a most attractive model, and merits close study. In the case of the types fitted with Villiers two-stroke engines, a choice of three varieties is given, i.e. the 150 c.c. ultra-lightweight already mentioned, together with the 250 c.c. and 350 c.c. types. The larger model is fitted with Sturmey-Archer three-speed gear. This or the sleeve valve engined machine is suitable for sidecar work.

DIAMOND. (93.)

Sleeve Valve or Two-stroke Models.

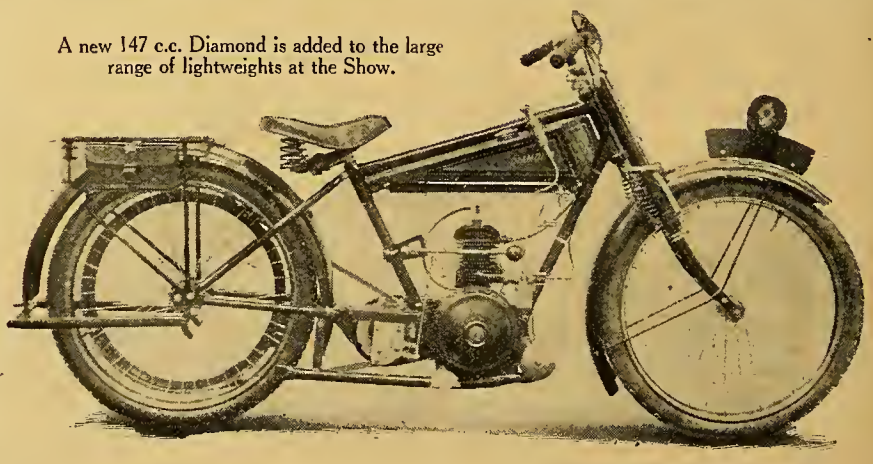
3½ H.P. MODEL.—79×70 mm. (343 c.c.); one cyl. two-stroke; drip feed lubrication; Amac carb.; flywheel-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2¼ tyres. Price £60.

THE D.F. AND M ENGINEERING CO., LTD., Diamond Works, Wolverhampton.—Visitors to this stand will find three different and well-known types of engines, one of which is a two-stroke (the Villiers); another, the well-known standard J.A.P., with side valves, found on



Brake pedal of the Diamond miniature.

A new 147 c.c. Diamond is added to the large range of lightweights at the Show.



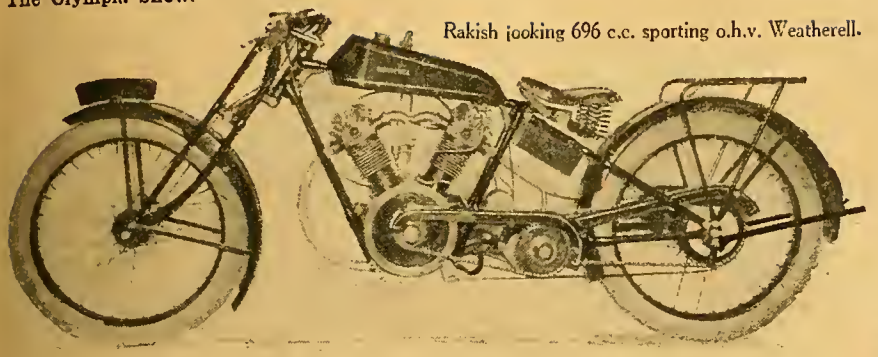
WEATHERELL. (17.)

With Speed Trials Interest.

2¾ H.P. MODEL.—71×88 mm. (348 c.c.); single cyl. four-stroke; overhead valves; drip-feed lubrication; Vici carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2¼in. tyres. Price £80.

R. WEATHERELL AND CO., LTD., The Terrace, High Road, Kilburn.—Perhaps the chief success of the 350 c.c. Weatherell was to win the 100-mile Giant Handicap at Brooklands last summer, but a study of 1922 speed trials results will often discover this make in a prominent position, for it has distinguished itself in many meetings, particularly in London and Home Counties. Various modifications have been made for next

The Olympia Show.—



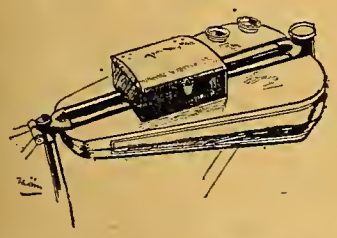
Rakish looking 696 c.c. sporting o.h.v. Weatherell.

year, notably a new type of fuel tank resting on the top of the duplex top tube. This change gives the machine a curiously speedy appearance.

5-6 H.P. MODEL.—71×88 mm. (696 c.c.); twin cyl. four-stroke; overhead valves; drip-feed lubrication; Vici carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 28×3in. tyres. Price: Solo, £115; with Sidecar, £135.

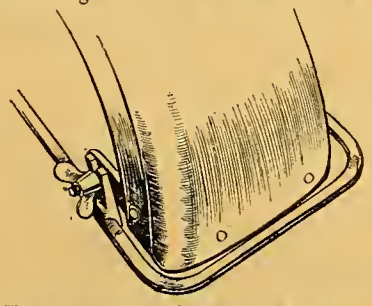
Weatherell machines are probably better known in their 250 c.c.-350 c.c. forms, but the 696 c.c. model with a sidecar attached has by no means disgraced itself on its few appearances on Brooklands track. It is an imposing machine, and should prove to have remarkable powers of acceleration. A side-valve model costs £10 less.

Tank rail tool bag on 348 c.c. Weatherell.



Another o.h.v. Blackburne-engined machine, of 249 c.c., completes a very striking trio of sports models. It is priced at £70 (with side valves £5 less). Internal expanding brakes front and rear, and neat, quickly detachable chain guards are features of all the machines. One of the new petrol tanks is also shown with a plated finish.

to speak of sidecar and a remarkably roomy tradesman's carrier at the astonishing price of £57 15s. The No. 2 Model is the cheapest, being shorn of any luxury fittings, so that the single-geared edition is listed at as low a price as many miniature 150 c.c. machines. For the first time chain drive makes its appearance on the *de luxe* models, on which the rear chain cover is ingeniously mounted to slide with the gear box when the latter is adjusted. The petrol tank is now supported from beneath on bridges carried on two light detachable tubes. The new band brake on the *de luxe* and the very simple rear belt rim shoe on the cheaper models are equally worthy of notice. Footboards, where fitted, are of the hinged type resting on rubber pads. A new spring frame is exhibited on this stand.



The front stand of the Weatherell is secured at the side of the mudguard.

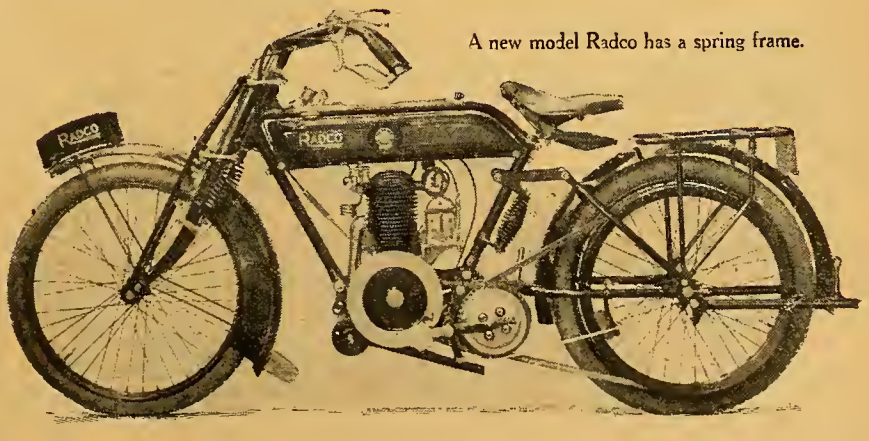
RADCO. (135.)

Many Models—One Engine.

2½ H.P. MODEL.—67×70 mm. (247 c.c.) single cyl. two-stroke; petroil or drip feed lubrication; Amac or Mills carburetter; chain-driven mag.; single gear; clutch and kick-starter; belt drive; 24×2in. tyres. Price, £31 10s.

E. A. RADNALL AND CO., Dartmouth Street, Birmingham.—The Radco is almost unique in that the makers adhere strictly to a single engine, with which, by means of various transmission options, they furnish a sufficient range of models to suit all purses. Their successful 247 c.c. two-stroke engine is retained practically without change for 1923, and is fitted to single gear, two-speed, three-speed, sporting, and lady's models, not

A new model Radco has a spring frame.

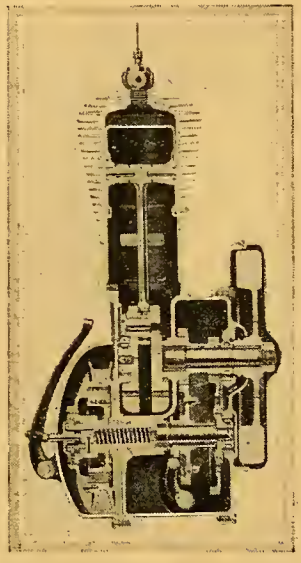


CLYNO. (27.)

Luxurious Big Twin at Low Cost.

8 H.P. MODEL.—76×102 mm. (925 c.c.); V twin cyl. four-stroke; side valves; mechanical lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 28×3in. tyres. Price: with Sidecar, £125.

CLYNO ENGINEERING CO., LTD., Wolverhampton.—Since the spring-frame Clyno sidecar outfit was a very advanced design at its inception, it does not require modification to modernise it. Engine and gear box are both of Clyno design and manufacture, and, while following conventional lines, are neatly carried out. For next year the clutch has been redesigned, and is now of the steel and phosphor-bronze plate type, instead of the cork insert pattern hitherto employed. The cylinder heads and timing gear have also been modified.



Clyno two-stroke engine and gear unit.

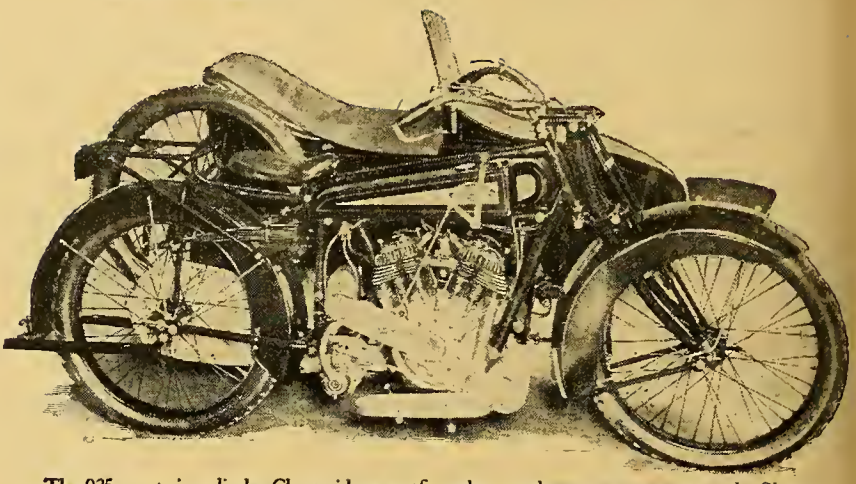
Detachable and interchangeable wheels, extremely efficient mudguarding, enclosed transmission, an adequate combined leg and undershield of improved design, and large rubber-studded footboards, contri-

The Olympia Show.—

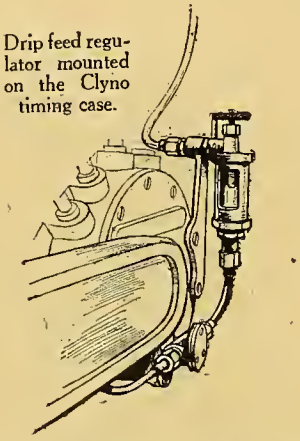
bute to the equipment of this luxurious machine, which, with a Magdyno lighting set (£15 extra) and an imposing sidecar with hood and windscreen, represents the sidecar outfit in its most highly developed form. The spare wheel costs £6 extra.

2½ H.P. MODEL.—70×70 mm. (269 c.c.); single cyl. two-stroke; petroil lubrication; Amac carburetter; gear-driven mag.; 2-sp. gear; no clutch or kick-starter; gear and belt drive; 26×2¼in. tyres. Price £45.

One of the most successful and neatly designed two-stroke lightweights of pre-war days, the Clyno makes a welcome reappearance without having undergone any drastic alterations. It will be recalled that its main feature was the absolute simplicity of its unit two-speed gear box.



The 925 c.c. twin cylinder Clyno sidecar outfit makes a welcome reappearance at the Show.



Drip feed regulator mounted on the Clyno timing case.

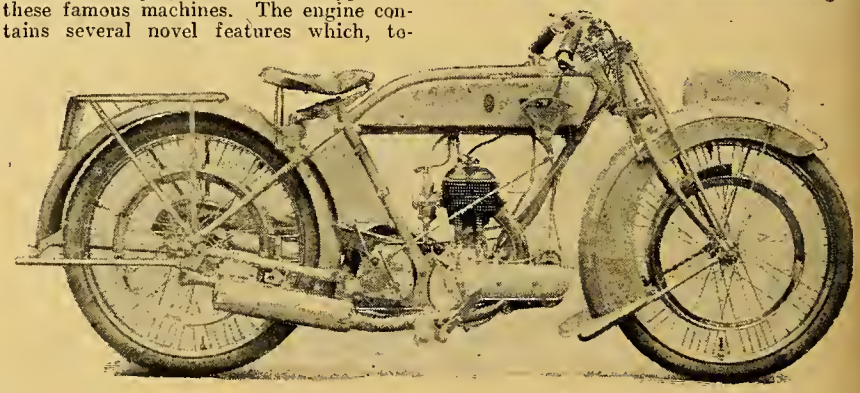
The offset engine is carried in a loop frame of otherwise conventional design. No clutch or kick-starter is provided, it being considered that paddling off is so simple as not to necessitate the complication of these members. All the Clynos on show have a new finish—black with a cream panel in the tank. Three outfits, one demonstrating the spring wheel sidecar and one lightweight, comprise the complete exhibit.

B.S.A. (96.)

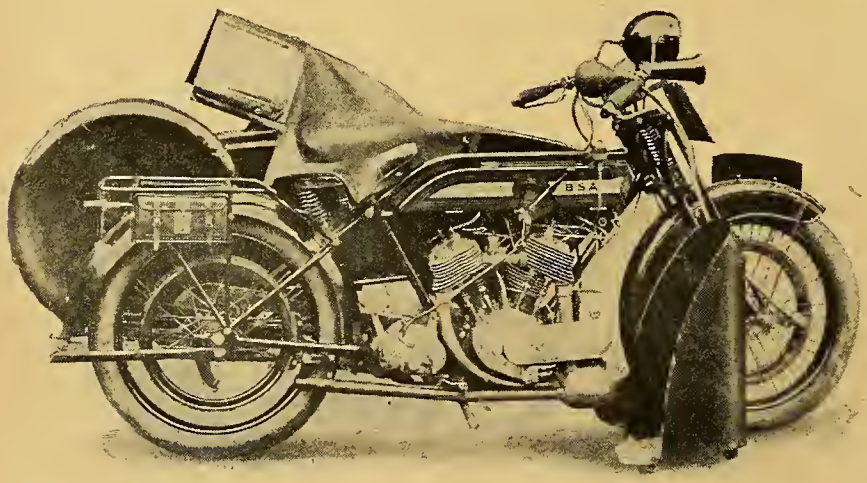
Singles and Twins in Five Sizes.

3½ H.P. MODEL.—80×98 mm. (493 c.c.); single cyl. four-stroke; side valves; mechanical lubrication; B.S.A. carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2½in. tyres. Price £70.

B.S.A. CYCLES, LTD., Small Heath, Birmingham.—The new 493 c.c. B.S.A. sports model is outstanding in a very attractive display of different types of these famous machines. The engine contains several novel features which, together with the general layout of the machine, combine to make it attractive to the speed merchant. The piston, though of cast-iron, has been very much lightened. An oil pump of the screw type, located in the timing cover, provides forced lubrication to the engine bearings, and the gear box has been modified, the ratios being somewhat closer than those of the standard design.



A French grey B.S.A. of 349 c.c. is a centre of attraction.



Footboard and leg shields shown detached from the 770 c.c. B.S.A. sidecar.

The handle-bars are adjustable as to angle of inclination, being held by a split lug at the top of the steering head, so that any adjustment required can be made by loosening its grip, moving the bars to a different angle, and then tightening up again. This is a feature which appeals to many.

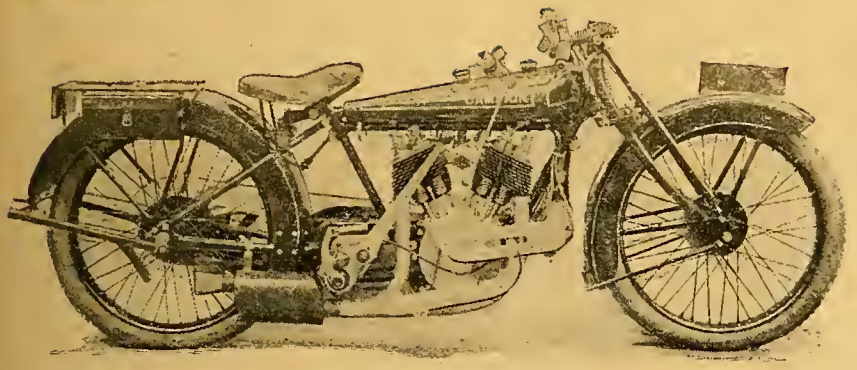
2¾ H.P. MODEL.—72×85.5 mm. (349 c.c.); single cyl. four-stroke; side valves; mechanical lubrication; B.S.A. carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2½in. tyres. Price £57 15s.

The features of the new B.S.A. 349 c.c. medium-weight model are similar to the sports machine already described, and with the firm's great reputation behind it, it forms a welcome addition to the range.

4¼ H.P. MODEL.—85×97 mm. (557 c.c.); single cyl. four-stroke; side valves; drip feed lubrication; B.S.A. carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive. 26×2½in. tyres. Price: Solo, £75; with Sidecar, £95.

Several examples of the standard 557 c.c. all-chain drive and chain-cum-belt models are also shown; the low prices are remarkable.

The Olympia Show.—

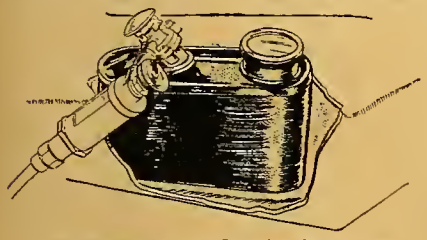


The Campion is a Nottingham representative of the big twin sports type.

6 H.P. MODEL.—76×85 mm. (770 c.c.); V twin-cyl. four-stroke; side valves; mechanical lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×3in. tyres. Price: Solo, £85; with Sidecar, £105.

Aluminium chain cases are no longer fitted, their place being taken by a light pressed case for the front chain and a guard for the final drive on the "light six" 770 c.c. twin-cylinder machine.

The B.S.A. concern has for some time made a speciality of protecting the rider from cold and wet. Their special leg-shields provide a degree of protection that is as yet unsurpassed. An example of the big twin sidecar outfit with enclosed chain drive and interchangeable wheels as well as a taxi outfit is also shown. The big twin outfit costs £140.



The oil tank of the Campion is separate from the main tank to avoid soldered partitions.

CAMPION. (72.)

8 H.P. MODEL.—85.5×85 mm. (976 c.c.); twin cyl. four-stroke; side valves; drip feed lubrication; B. and B. carb.; chain-driven mag.; 4-sp. gear; clutch and kick-starter; chain drive; 28×3in. tyres. Price: Solo, £132; with Sidecar, £157.

CAMPION CYCLE CO., LTD., Robin Hood Street, Nottingham. — Most striking amongst the Campion exhibit is the Super Sports 976 c.c. model, with the Jardine four-speed gear box. This machine is painted bright vermilion, and is fitted with a sidecar and exceptionally wide car-type black mudguards. The idea is that this shall be a fast and powerful touring outfit, and yet if the mudguards are removed and the sidecar detached, it shall be a suitable mount for the "unlimited" solo classes of speed events. All the other motor cycles on the stand exhibit the wide range covered by the machines manufactured by the company. There is, for example, the 250 c.c. Villiers two-stroke, with sloping top tube and footboards, and a 348 c.c. Blackburne single-cylinder lightweight, as well as a J.A.P.-engined machine of similar size and type. Of the sidecars one is a plain ordinary design meant for everyday use, and built at as low a price as possible. The other has a luxurious touring equipment, with spare wheel, a Cape hood, apron, and a boot behind for luggage or spare parts. All wheels are interchangeable.

BOWN. (102.)

Varied Choice of Engines.

1½ H.P. MODEL.—55×62 mm. (147 c.c.); single cyl. two-stroke; petroil lubrication; Amac carb.; flywheel mag.; 2-sp. gear; no clutch or kick-starter; chain-cum-belt drive; 26×2in. tyres. Price £31 15s.

BOWNS, LTD., Æolus Works, Summer Lane, Birmingham.—Several alternatives are offered by the makers of the Bown motor cycles, Blackburne, J.A.P., and Villiers-engined models being shown upon the stand. The general specification apart from the engine is similar in each case. These machines are laid down and constructed on lines that are sound, solid, and practical, and ample provision is made for silencing, the exhaust pipes in every case being taken right out to the back of the machine.

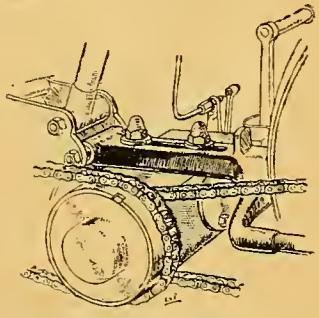
Internal expanding Brampton front wheel brakes may be fitted as an alternative to the ordinary rim brake, and the Brampton fork with centrally placed tension spring has been standardised. Adjustment is provided for the front driving chain to the gear box.

METRO-TYLER. (159.)

Wireless Equipped Sidecar Outfit.

5-6 H.P. MODEL.—71×88 mm. (696 c.c.), twin cyl. four-stroke; side valves; drip-feed lubrication; Amac carb.; chain-driven mag.; 4-sp. gear; clutch and kick-starter; all-chain drive; 26×2½in. tyres. Price: Solo, £97 13s.; with Sidecar, £160 13s.

THE METRO-TYLER CO., LTD., Banister Road, Kilburn Lane, London, W.10.—Everything else on the Metro-Tyler stand is inclined to be dwarfed by the magnificence of the limousine aluminium sidecar fitted to the 696 c.c. twin. It is a very fine example of sheet metal work, and, although of imposing dimensions, it weighs only 63 lb., or, including the wireless receiving set with which it is equipped, 70 lb. The machine itself is a perfectly straightforward design, little altered for this year. It has a Jardine four-speed gear box and internal expanding brakes front and rear, but is not at all weighty, and is eminently suited for solo use.



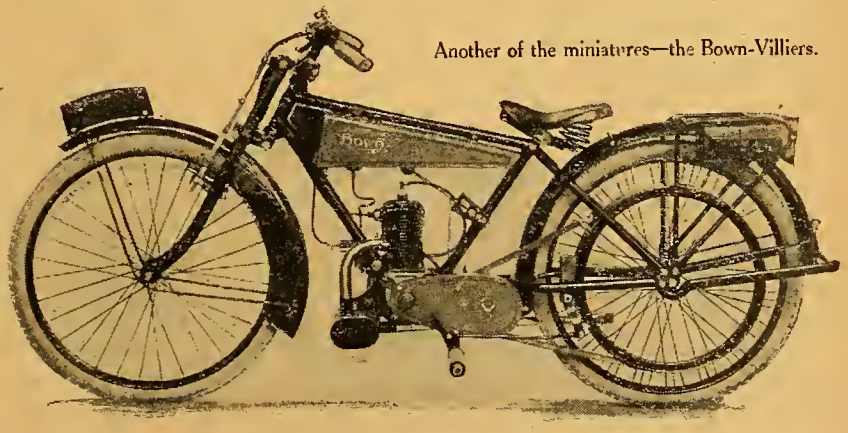
Gear box fixing on the Metro-Tyler.

2½ H.P. MODEL.—70×70 mm. (269 c.c.); single-cyl. two-stroke; drip-feed lubrication; Amac carb.; chain-driven mag.; 2-sp. gear; no clutch or kick-starter; chain and belt drive; 26×2½in. tyres. Price £54 12s.

Few alterations have been made on the well-known "all-enclosed" Metro-Tyler two-stroke, which, as the name implies, has a covered-in crank case, gear box, and magneto. A commendably clean-looking appearance is the result. A roller-bearing big end is employed, and the crankshaft construction, which permits this without employing a built-up crank-pin, is patented.

2½ H.P. MODEL.—70×70 mm (269 c.c.); single-cyl. two-stroke; drip-feed lubrication; Amac carb.; chain-driven mag.; single gear; belt drive; 26×2½in. tyres. Price £35 14s.

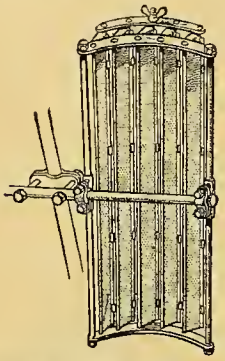
Another of the miniatures—the Bown-Villiers.



The Olympia Show.—

Known, on account of its finish, as the "All-black Baby," the single-geared 269 c.c. model is a good example of the simplest type of miniature, in all but engine capacity. It weighs 120 lb., and is claimed to be the lightest machine in the Show in the 250 c.c.-350 c.c. class. Notwithstanding, it is sturdily constructed.

Conventionally laid-out machines using the 269 c.c. Metro-Tyler engine, and the side-valve and o.h.v. 348 c.c. Blackburne engines are also shown. The last-mentioned has all-chain drive and an Albion three-speed gear box, and is priced at £79 16s.



The louvre type leg shields which open and close at will on the new Coventry Victor.

COTTON. (23.)

Successful Frame Triangulation.

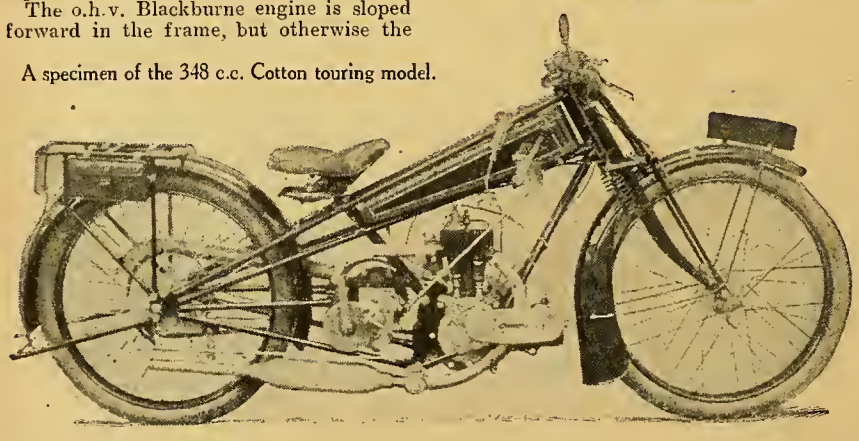
2¾ H.P. MODEL.—71×88 mm. (348 c.c.); single cyl. four-stroke; overhead valves; drip feed lubrication; Amac carburetter; chain-driven mag.; 3-sp. gear; clutch, no kick-starter; chain drive; 26×2¼in. tyres. Price, £72.

THE COTTON MOTOR CO., Gloucester.—Until this year the advantages of the Cotton duplex and fully triangulated frame have been admitted mainly in theory. At the T.T. races they were demonstrated in practice. S. Woods, the Cotton rider, came very near to winning the 350 c.c. class, actually finishing fifth after an unparalleled series of accidents, including a fire that put his brakes out of action. A machine on which feats like this have been accomplished naturally demands attention, and considerable interest is being taken in its marketed replica.

The o.h.v. Blackburne engine is sloped forward in the frame, but otherwise the power unit, transmission, etc., are adequately covered by the specification above. A neat cylindrical aluminium silencer is fitted to this and all the Cotton models.

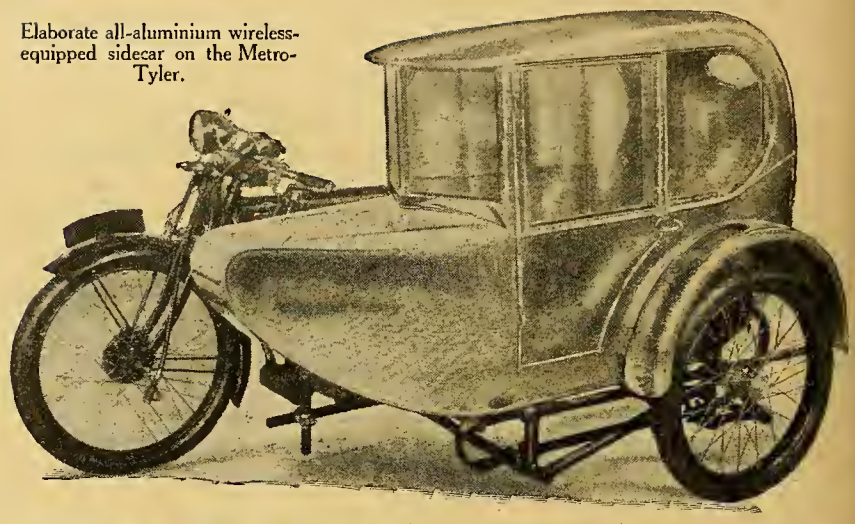
Four other less racy Cottons are on show: (1) a 247 c.c. Villiers with two-speed gear and final belt drive, £49; (2) a 249 c.c. side-valve Blackburne with the same transmission, £57; (3) a 348 c.c. side-valve Blackburne, also with the same transmission, £60; and (4) a 348 c.c. Blackburne with three-speed gear and all-chain drive, £67.

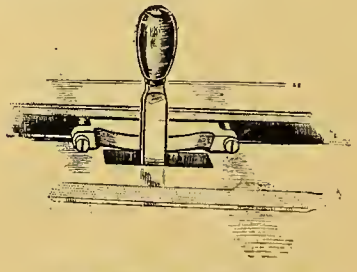
1923 improvements include an alteration to the head lug, which lowers the handlebars by 1½in. The saddle remains about 25in. from the ground.



A specimen of the 348 c.c. Cotton touring model.

Elaborate all-aluminium wireless-equipped sidecar on the Metro-Tyler.





Central gate control of the James lightweight two-stroke.

JAMES. (75.)

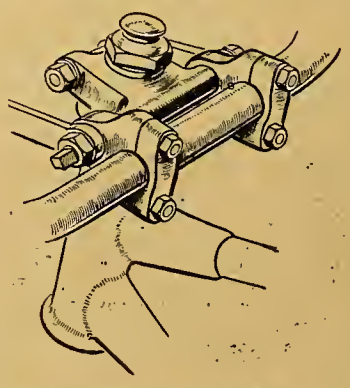
Wide Range Handsomely Finished.

2¾ H.P. MODEL.—73×83.5 mm. (349 c.c.); single-cyl. four-stroke; side valves; pump lubrication; Mills carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2½in. tyres. Price £65.

JAMES CYCLE CO., LTD., Greet, Birmingham.—Principal model on the James stand is the latest type of 349 c.c. single-cylinder, which differs considerably from the lines which have been characteristic of the James motor cycle for a good many years. There is a dropped top tube and sloping tank, giving a very low seating position. The engine has a detachable head, inside flywheels, a roller bearing for the big-end, ball bearings for the crankshaft, and side valves of nickel steel. A three-speed countershaft gear, controlled by a very large gear lever working in a quadrant on the right-hand side of the tank, is fitted.

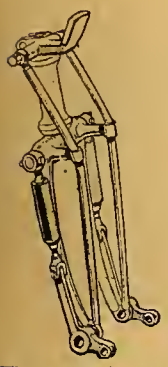
The little two-stroke model has an engine of 239 c.c., with the fins staggered in the manner to which we have become accustomed for so many years on the James.

The remaining machines on the stand include the 500 c.c. twin (considerably cleaned-up), and the 749 c.c. twin, specially designed for sidecar work, while a sectional engine is exhibited to show the working parts.

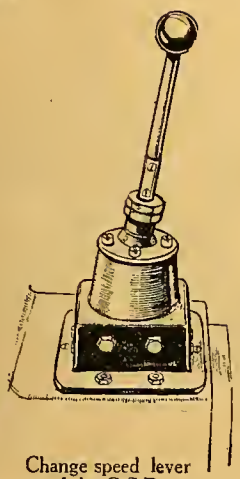


James handle-bar fixing enabling various positions.

The Olympia Show.—

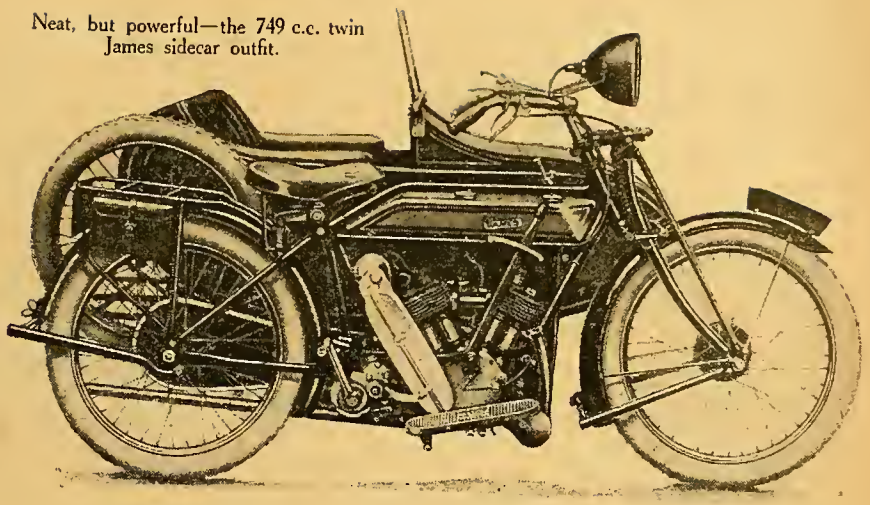


The spring fork of the 4 h.p Bianchi.



Change speed lever of the G.S.D.

Neat, but powerful—the 749 c.c. twin James sidecar outfit.



DUZMO. (15.)

Sports Single.

3½ H.P. MODEL.—89×79 mm. (496 c.c.); single cyl. four-stroke; overhead valves; mechanical lubrication; Binks "Rat-trap" carb.; chain-driven mag.; 3-sp. gear; chain drive; 650×65 mm tyres. Price £100

JOHN WALLACE, CEDAR ROAD WORKS, Enfield Highway, London—The above is a specification of the standard sporting model Duzmo, which, on Saturday evening, when *The Motor Cycle* report was completed, had not arrived on its stand. It arrived on Monday.

Although it may seem paradoxical to say so, the Duzmo sports model is the standard type, the touring model being a supplementary design for the sidecarist. This gives the cue to the machine, which represents one of the earliest efforts to give the sporting motor cyclist a machine that is something more than a semi-stripped modification of a touring model. To-day it is not alone in this respect, but the fact that it was among the first in the field entitles it to respect. In designing the engine, and, indeed, the whole machine, an attempt has been made made to combine a high road performance with a reasonable degree of comfort. To this end the inclined o.h.v. engine is laid out so that the gases are allowed the freest possible ingress and exit, and combustion head and valve passages have a highly polished finish. Frame design and tyre size contribute towards ease of handling for long-distance riding.

DOUGLAS. (61.)

Touring and Racing Flat Twins.

2¾ H.P. MODEL.—60.5×60 mm. (348 c.c.); flat twin cyl. four-stroke; side-by-side valves; drip feed lubrication; Amac carb.; gear-driven mag.; 2-sp. gear; no clutch or kick-starter; chain and belt drive; 26×2¼in. tyres. Price £50.

DOUGLAS MOTORS, LTD., Kingswood, Bristol.—For many years the Douglas motor cycle has held a position on the market entirely of its own, and the recent successes of the larger machines have brought the make prominently before the public in the last few weeks. The 348 c.c. machine is practically identical, as far as its main lines are concerned, with the motor cycle with which the Douglas firm made its name, but it is available, of course, now both with the belt and with chain drive, clutch and kick starter, and three-speed gear.

3½ H.P. MODEL.—68×68 mm. (494 c.c.); flat twin cyl. four-stroke; overhead valves; mechanical lubrication; Amac carb.; gear-driven mag.; 3-speed gear; clutch and kick-starter; chain drive; 650×65 mm. tyres. Price £95.

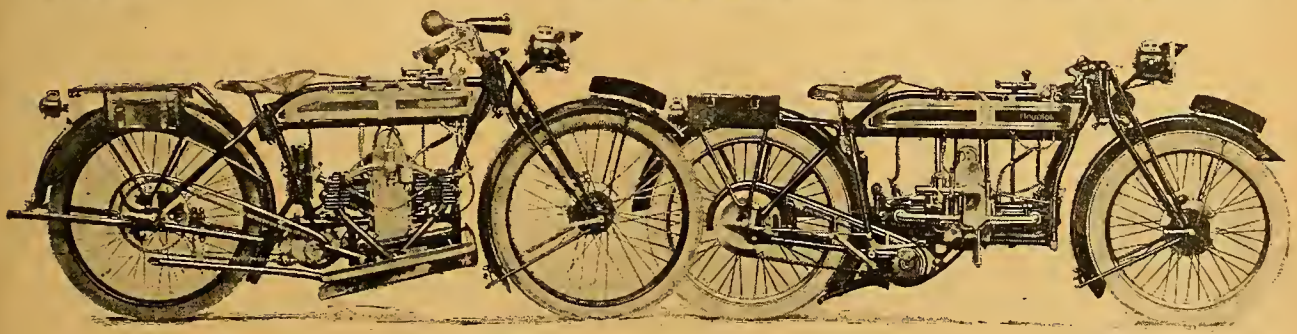
In addition there is the 494 c.c. model, with which so much has been done at Brooklands and which was the first machine of the 500 c.c. class officially to exceed 100 m.p.h. This engine is, broadly speaking, on the same lines as the 348 c.c. model, but has overhead valves, and the machine shown on the stand is of the Tourist Trophy type. There is also the 733 c.c. model, intended especially for sidecar work, which is very much on the same lines as the 494 c.c., save that the engine has a bore and stroke of 83×68 mm. (733 c.c.). Finally the 595 c.c. machine, also chiefly for sidecar work, is exhibited, and has mechanical lubrication. This engine has been but little altered of recent years, and is almost of the same design as the smallest machine, save that the frame is on the lines of the 494 c.c. type. The bore is 74.5 mm. and the stroke 68 mm. The price of the 595 c.c. model is £85 solo, £110 with sidecar.

BIANCHI. (156.)

Italy's Advanced Design.

6 H.P. MODEL.—70×78 mm. (600 c.c.); twin-cyl.; four-stroke; side valves; drip feed lubrication; Amac carburetter; chain-driven mag.; 3-sp. gear; clutch and kick-starter; gear and chain drive; 26×3in. tyres. Price: Solo £135; with sidecar, £150.

BIANCHI MOTORS, LTD., 26, St. James Street, London, S.W.1.—Emanating from an old-established car factory in Milan, Bianchi motor cycles are notable for their fine detail finish. The workmanship—"craftsmanship" might be a better word—is excellent, and so is the manner in which the engine and gear box are carried together in the sturdy loop frame to form one unit. The primary drive is by gear, but from a glance at the clean contour of its cover a primary chain might be expected. In some respects the frame design is not unlike the familiar New



Chain-driven three-speed 348 c.c. Douglas.

Sporting solo model of the 733 c.c. Douglas.

The Olympia Show.—

Imperial system. Both wheels are detachable and interchangeable, and the wide mudguards are detachable.

4 H.P. MODEL.—75×112 mm. (498 c.c.); single cyl. four-stroke, side valves; drip feed lubrication; Amac carburetter; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×3in. tyres. Price: Solo, £100.

In most respects the smaller model follows the lines of the 600 c.c. twin, but since the gear box is mounted fairly high up, the frame is considerably more compact. Both engines are quite straightforward in design, but the cylinder castings are worthy of inspection as unusually good examples of the foundry-man's art.

LEVIS. (68.)

Pioneer Two-strokes.

2¼ H.P. MODEL.—62×70 mm. (211 c.c.); single cyl. two-stroke; drip feed lubrication; B. and B. carb.; chain-driven mag.; 2-sp. gear; clutch and kick-starter; chain and belt drive; 24×2¼in. tyres. Price £49.

BUTTERFIELDS, LTD., Stechford, Birmingham.—An early machine to make a name on the market as a two-stroke lightweight, the Levis is still represented by one model having the original lines and simplicity. This is shown with a single gear belt drive and everything reduced to its simplest possible expression. The remaining models have the 211 c.c. engine and the 247 c.c. engine, but the design of all is on much the same lines, the differences being that the 247 c.c. unit has a three-speed gear of chain drive, and both expanding brakes act on the rear wheel. Chain and belt is used for two of the 211 cc. machines, the chain from the engine being neatly covered in by a metal case.

Naturally, the Levis wins in the Lightweight T.T. and the French and Belgian Grand Prix Races have earned a more than ordinary amount of interest for the marketed representatives of the successful machine.

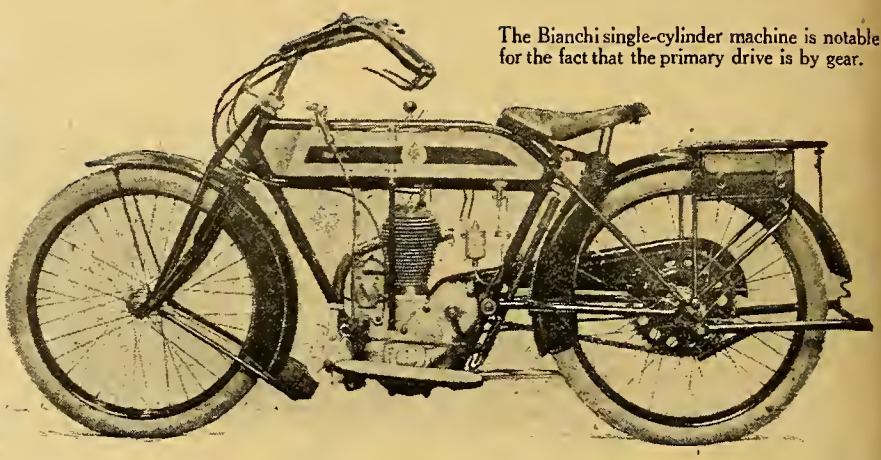
VERUS AND SIRRAH. (164.)

Eight Light Solo Models.

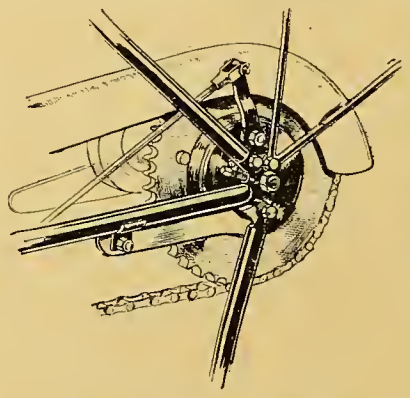
2¾ H.P. MODEL.—70×90 mm. (346 c.c.); single-cyl. four-stroke; side valves; mechanical lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch, no kick-starter; chain drive; 26×2½in. tyres. Price £90.

ALFRED WISEMAN, LTD., Glover Street, Birmingham.—Three Verus models are shown, the remaining five on the stand being Sirrahs, which are utility machines produced by the same firm. None of the eight has a greater engine capacity than 350 c.c., and the super-sporting Verus specified above is typical of the rest, except that it has several refinements naturally not found on, say, the 293 c.c. Sirrah sidecar outfit at £67. Best mechanical pump lubrication is employed, oil being carried in a shapely aluminium tank on the saddle tube. Adjustable footrests, internal-expanding brakes front and rear, a tool bag on the top rear stay (no carrier is fitted), and an adjustable drip oil-feed to the front and rear chain, are neat features of this model, which is very attractive in appearance.

An o.h.v. 348 c.c. Blackburne-engined Verus with an unusually disposed exhaust pipe is priced at £94, and a side-valve o.h.v. Blackburne model at £66. Chain-cum-belt drive is used in the last-mentioned case.



The Bianchi single-cylinder machine is notable for the fact that the primary drive is by gear.



Levis internal expanding rear brake.

2¾ H.P. MODEL.—70×76 mm. (292 c.c.); single cyl. two-stroke; side valves; drip feed lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2¼in. tyres. Price, with Sidecar, £67.

Already mentioned, the Sirrah sidecar outfit deserves a special specification on account of its very moderate price. The sidecar is a lightweight Canoelet, the gear box a Burman, the forks Brampton, and the rest of the components and equipment of equally well-known and reputable makes. The same machine, solo, with a two-speed box, clutch and kick-starter, and final belt drive, is £50.

Two further light solo models with the same transmission, but employing 249 c.c. Blackburne and 211 c.c. two-stroke Sirrah engines, cost £52 10s. and £50 respectively, while a well-thought-out 150 c.c. o.h.v. miniature called the Weaver completes a comprehensive exhibit, yet hardly fully representative of the very complete range marketed.

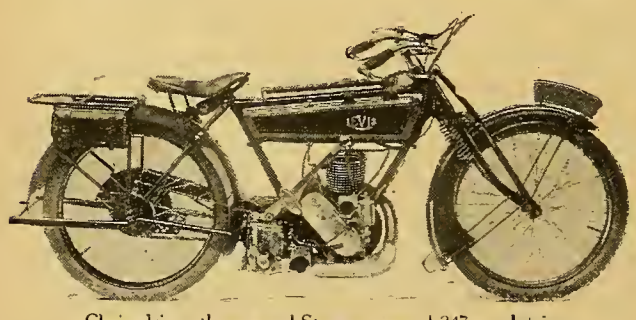
SPARKBROOK. (137.)

Well-finished Cycle Work.

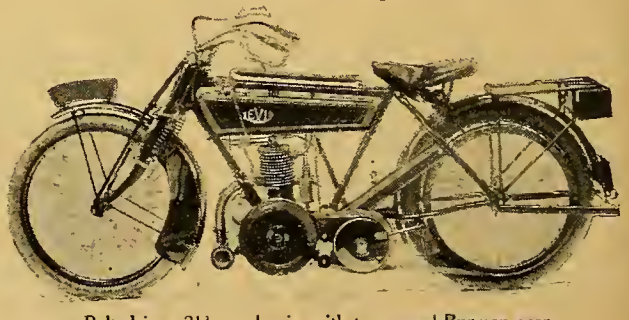
2½ H.P. MODEL.—67×70 mm. (247 c.c.); single cyl. two-stroke; drip feed lubrication; B. and B. carb.; flywheel mag.; 2-sp. gear; clutch and kick-starter; chain and belt drive; 26×2¼in. tyres. Price £50.

SPARKBROOK MFG. CO., Paynes Lane, Coventry.—This model remains unaltered from last year, but is worth attention in all its cycle details, such as the duplex handle-bar fixing and the length of steering head lug.

2¾ H.P. MODEL.—70×90 mm. (346 c.c.); single cyl. four-stroke; side valves; hand pump lubrication; B. and B. carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2¼in. tyres. Price £66.



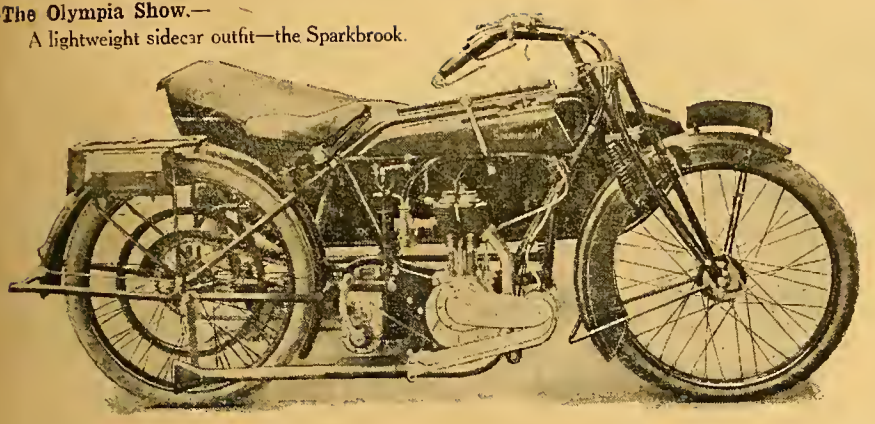
Chain-driven three-speed Sturmey-geared 247 c.c. Levis.



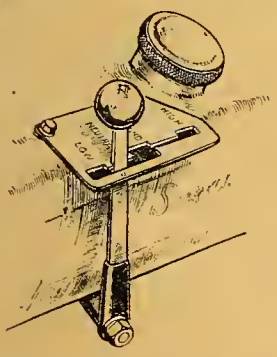
Belt-driven 211 c.c. Levis, with two-speed Burman gear.

The Olympia Show.—

A lightweight sidecar outfit—the Sparkbrook.



The 346 c.c. J.A.P.-engined model is an entirely new one of excellent quality throughout. Details of interest include the very neat expansion chamber located unostentatiously beneath the gear box. The head lug is carried well down below the point where a front sidecar attachment would be fixed, and it is then chamfered. The near-side stay of the rear mudguard swings out so that the wheel can be cleared for tyre repairs instead of weakening the guard itself by a hinge. Very substantial drawbolts are used for the rear chain adjustment. The mounting of the front guard by lugs on both fork members is notable. Altogether the cycle work is admirable throughout.



The very simplest form of gear gate—a slotted plate on the tank—is employed on the Sparkbrook.

2¾ H.P. MODEL.—70×90.5 mm. (349 c.c.); single-cyl. four-stroke; sleeve valve; hand pump lubrication; B. and B. carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2¼in. tyres. Price: Solo, £69; with Sidecar, £89.

This model differs from the foregoing solely in the engine, which is the popular Barr and Stroud sleeve valve pattern. The installation has been very neatly carried out with the magneto sheltered behind the cylinder. The engine cradle is very stiff, and the oil from the crank case release is neatly directed on to the primary chain.

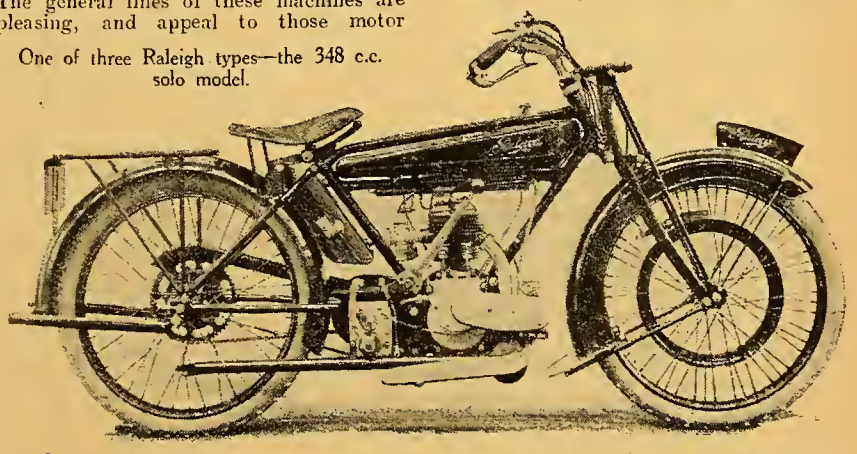
RALEIGH. (99.)

Outside Flywheel Singles.

2¾ H.P. MODEL.—71×88 mm. (348 c.c.); single cyl. four-stroke; side valves; drip-feed lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2¼in. tyres. Price £66.

RALEIGH CYCLE CO., LTD., Nottingham. Two models of the well-known 348 c.c. medium-weight Raleigh are shown, and pride of place must be given to the 348 c.c. all-chain model which, with Sturmey-Archer three-speed gear, forms a very complete and practical touring mount. The cheaper model differs from the above, in that it is provided with a two-speed gear and chain-cum-belt drive at £55. The general lines of these machines are pleasing, and appeal to those motor

One of three Raleigh types—the 348 c.c. solo model.

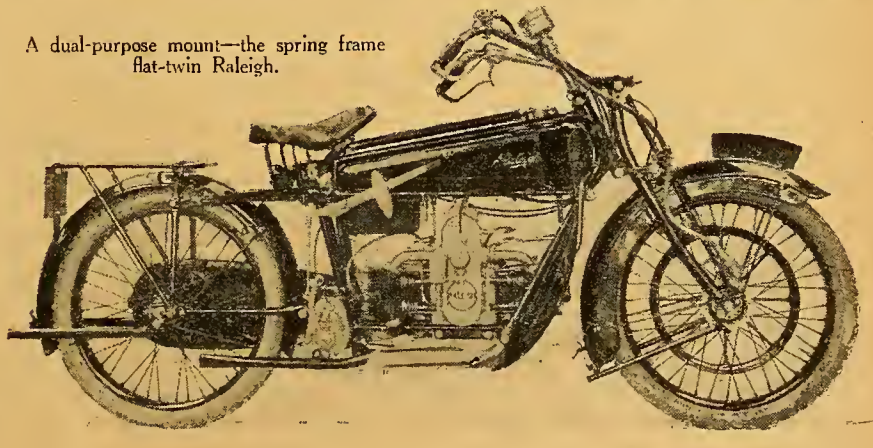


cyclists who require a substantial and reliable touring mount, which, whilst capable of a good turn of speed, cannot be described as a racing machine. A detail which appeals specially to the practical rider is the arrangement of holder to display the licence on the side of the tool-bag beneath the seat-pillar tube.

Very attractive also is a sports model of the lightweight, which differs more than merely in having flat bars and foot-rests. The engine has been modified internally so as to attain higher "revs," and over 60 m.p.h. is within its reach.

The horizontally opposed twin-cylinder model is shown with a sidecar, and incorporates many features of refinement which appeal to those who love comfort on the road. The wheels are detachable and interchangeable, and the general finish and workmanship of the outfit are of a very high order. A capacious locker is provided at the rear of the sidecar body, and a fixed windscreen is also fitted. The price is £130.

A dual-purpose mount—the spring frame flat-twin Raleigh.



MELEN. (105.)

Box Carrier Motor Tricycle.

2¾ H.P. MODEL.—70×77 mm. (297 c.c.); single cyl. four-stroke; drip feed lubrication; Amac carb.; direct-driven mag.; 3-sp. gear; chain drive; 24×2¼in. tyres. Price £80.

F. AND H. MELEN, LTD., Sherlock Street, Birmingham.—A unique little business three-wheeler is shown on the Melen stand, which otherwise is for the most part devoted to bicycles. It is fitted with a 297 c.c. two-stroke engine, three-speed gear, and chain transmission. Two brakes act on a single rear drum; one is an external contracting band and the

other is a shoe, pulled on to the inner periphery by the hand lever. From experience on the road it has been found to be a particularly stable little vehicle, efficiently sprung, economical, and very suitable for the type of driver who is likely to handle it. The accommodation, too, is good, the carrying capacity being from 1½ to 2 cwt.

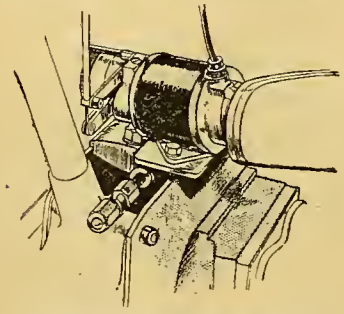
MATCHLESS. (71.)

Solo Models Introduced.

8 H.P. MODEL.—85.5×85 mm. (976 c.c.); twin cyl. four-stroke; side valves; drip feed lubrication; B. and B. carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×3in. tyres. Price: Solo, £115.

H. COLLIER AND SONS, LTD., Plumstead, London, S.E.18.—To solo riders one of the most interesting machines in the Show is the 976 c.c. J.A.P.-engined solo Matchless.

The engine, despite its size, looks extremely neat, the tank concealing a twin top tube—an arrangement which adds considerably to the appearance of the machine—while the knee grips are secured by concealed screws to the side of the tank. Very heavy mudguarding is employed, with ample clearance between the tyre and the guard. The chain is partially protected, and the wheel hub carries a gear for the speedometer drive.



Magneto mounting on the 348 c.c. Matchless.

No less than eight variations of the sidecar outfit occupy the stand. They vary from a sports model with a particularly neat form of carrier to the rear of and above the sidecar, to the latest and most comfortable type of touring vehicle, which has a windscreen with a side panel, a cape hood, and every known accessory which could assist or make more comfortable the occupants; it is listed at £175.

Finally, there are two examples of the new 348 c.c. solo Matchless, which uses proprietary components—Blackburne engine and Sturmey gear box—in a distinctive manner. On one the electric equipment is the new Lucas Magdynette.

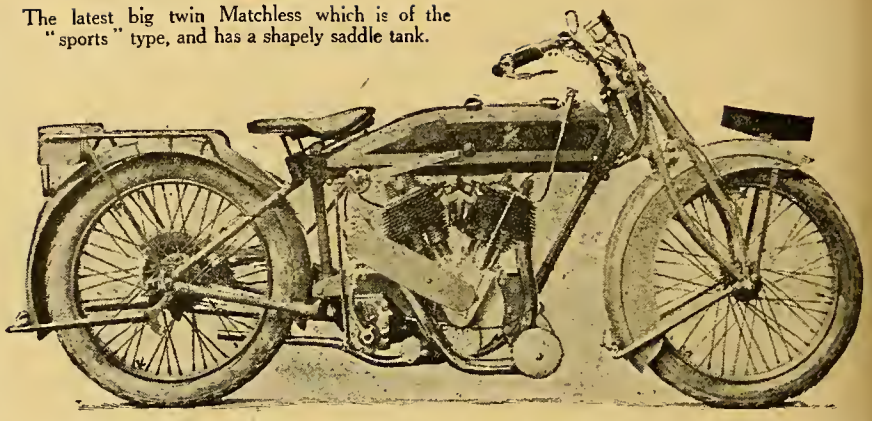
RUDGE. (97.)

New Four-speed Models.

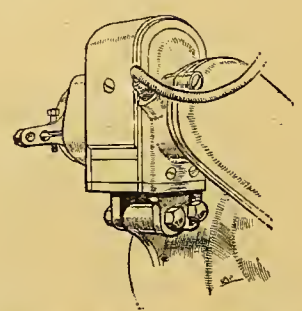
3½ H.P. MODEL.—85×88 mm. (499 c.c.); single cyl. four-stroke; o.h. inlet valve; foot pump lubrication; Senspray carb.; gear-driven mag.; 4-sp. gear; clutch and kick-starter; chain drive; 650×65 mm. tyres. Price: Solo, £85; with Sidecar, £100.

RUDGE-WHITWORTH, LTD., Coventry.—Chief interest on the Rudge stand centres round the models, both single and twin cylinder, fitted with the new four-speed

The latest big twin Matchless which is of the "sports" type, and has a shapely saddle tank.



gear box and all chain drive. This gear box, the double helical pinions of which are constantly in mesh, was described in our last issue and can be studied in detail on the stand. Opportunity is also afforded of scrutinising the technical details of the engine which, both in the case of the single and twin cylinder types, contains many special features. A sectional model on the stand lays bare the piston, which is aluminium and has special grooving designed to facilitate lubrication.



A simple but effective magneto chain adjustment—a Powell feature.

The 998 c.c. twin-cylinder outfit forms an imposing display, and the fitting and general arrangement of the new four-speed gear have been carried out in a most practical manner. The bracket supporting the gear lever quadrant, for instance, is brazed instead of being clipped to the frame.

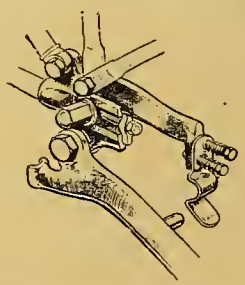
The general specification of single and twin-cylinder all-chain models is similar, and the Rudge-Multi belt-driven machines at £65 are also well represented.

QUADRANT. (161.)

Moderate Priced Big Single Outfit.

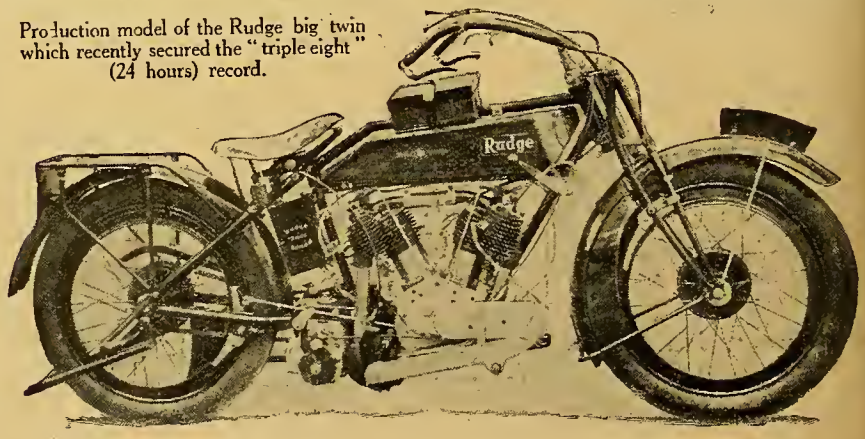
4½ H.P. MODEL.—87×110 mm. (654 c.c.); single cyl. four-stroke; side valves; hand pump lubrication; Binks carb.; gear-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 700×80 mm. tyres. Price: Solo, £75; with Sidecar, £95.

MARCH, NEWARK, AND CO., LTD., 45-53, Lawley Street, Birmingham.—Always one of the most moderately priced big singles, the 654 c.c. chain-driven Quadrant still retains a position in this respect that requires some surpassing. It has a sturdy, straightforward engine



Stand clip on the fork end of the Quadrant.

Production model of the Rudge big twin which recently secured the "triple eight" (24 hours) record.



The Olympia Show.—

noted for its slogging capabilities and distinguished by the unusual position of the inlet valve—behind the cylinder.

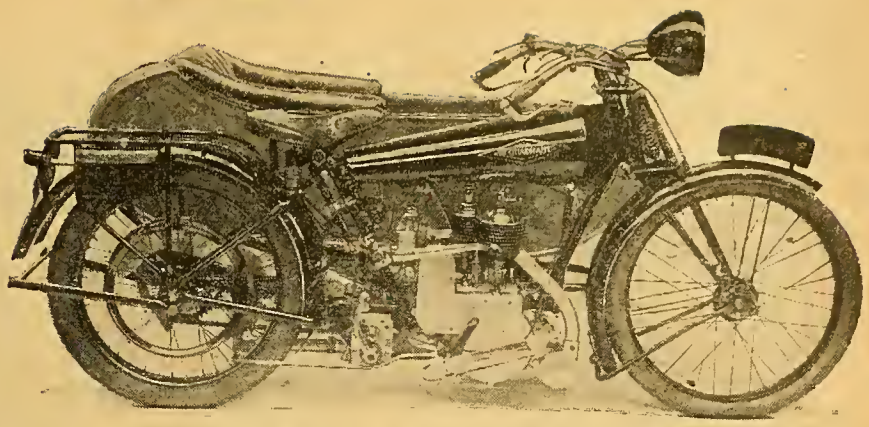
With a Lucas dynamo lighting set, a model *de-luxe* costs £110 with sidecar, or £90 solo (not shown).

With final belt drive, 26 × 2½in. tyres, and a stirrup pattern front brake, the sidecar outfit is £90.

3½ H.P. MODEL.—79×100 mm. (490 c.c.); single cyl. four-stroke; side valves; hand pump lubrication; Binks carb.; gear-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2½in. tyres. Price: Solo, £63; with Sidecar, £80.

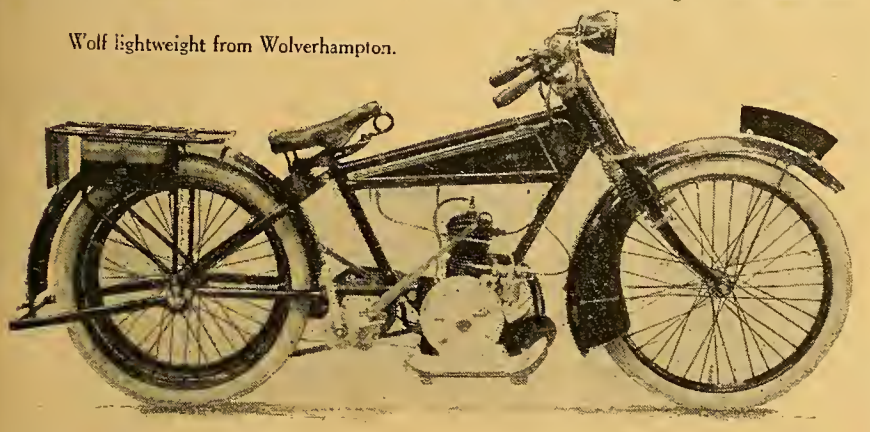
As an amply powerful dual-purpose semi-sporting machine, the new 490 c.c. Quadrant has much to recommend it. Although considerably lighter and neater looking than the 654 c.c. machine, it is just as sturdily constructed. The riding position is good, and the brake pedal is commendably accessible to the right footrest.

Quadrant spring forks, a front internal-expanding brake, and a saddle tank are items on this model, as on the majority of the other machines.



Electrically equipped model of the 654 c.c. Quadrant.

Wolf lightweight from Wolverhampton.



WOLF. (125.)

Choice of Many Alternatives.

1¼ H.P. MODEL.—55×62 mm. (147 c.c.); single-cyl. two-stroke; petroil lubrication; Amac carb.; flywheel mag.; 2-sp. gear; no clutch or kick-starter; chain and belt drive; 24×2¼in. tyres. Price £31 10s.

THE WULFRUNA ENG. CO., LTD., Wolverhampton.—The 1923 range of Wolf motor bicycles is probably the most complete in the industry, both as regards size, type, and make of engine and options in transmission. Three or four alternative drives are permitted with the different engines according to customer's preference. The baby of the family is Model F, equipped with the 147 c.c. Villiers engine and a range of no less than five transmission options. Customers desiring more power may order the 247 c.c. or 343 c.c. Villiers two-stroke engines, whilst those who prefer a four-stroke engine may specify the 293 c.c. or 345 c.c. J.A.P. or the 249 c.c. Blackburne. The 550 c.c. Blackburne engine, tourist model, is a particularly handsome example. The sports model with o.h.v. Blackburne engine, finished in black and gold, should be especially popular. The 249 c.c. Blackburne-engined model with two-speed and chain drive is to be sold at £67 10s.

4¼ H.P. MODEL.—85×96 mm. (545 c.c.); single cyl. four-stroke; side valves; drip feed lubrication; Amac or B. and B. carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain and belt drive; 26×2½in. tyres. Price: Solo, £75.

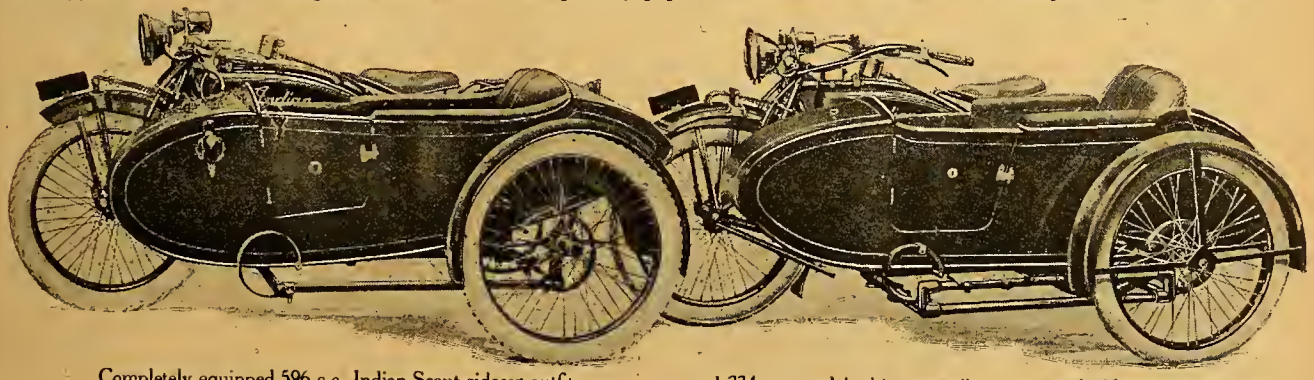
A substantially built machine suitable alike for touring or heavy sidecar work. It has a Blackburne engine, and the gear box is either Burman or Sturmey. An alternative model with all-chain drive is available at an additional cost.

INDIAN. (63.)

Over 1,200 c.c. Capacity.

10 H.P. MODEL.—82.5×112.6 mm. (1,234 c.c.); twin cyl. four-stroke; side valves; mechanical lubrication; Schebler carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 28×3in. tyres. Price: Solo, £137; with Sidecar, £167.

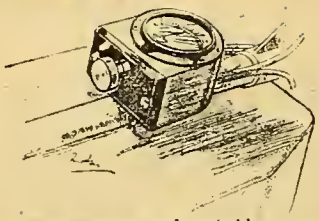
HENDEE MANUFACTURING CO., Indian House, Euston Road.—Most of the interest in the Indian naturally centres on the new 1,234 c.c. model, known as the Super Chief. So large an engine reminds one of the earlier efforts to obtain high speed, but this, the latest type, differs so greatly from its predecessors that a comparison is almost impossible. Not only is the engine neater, but the whole machine, though on lines built for speed, is a really workmanlike and practical job. The influence of American thought is apparent throughout, as, for example, in the method adopted to enclose the valves and valve springs, so protecting them from dust or mud. Besides the Super Chief which is



Completely equipped 596 c.c. Indian Scout sidecar outfit.

1,234 c.c. model with convertible two-seated sidecar with the rear seat folded up.

The Olympia Show.—



The neat ammeter and switchbox on the top tube of the Indian.

shown with a sidecar, there is the ordinary Chief of 998 c.c., which is similar to the one shown last year. A third model, the 596 c.c. Scout, is also on the stand, but is in general design the same as the other two. All the machines are finished in the familiar Indian bright red, and the electrical accessories are carried out with an admirable thoroughness.

CHATER-LEA. (78.)

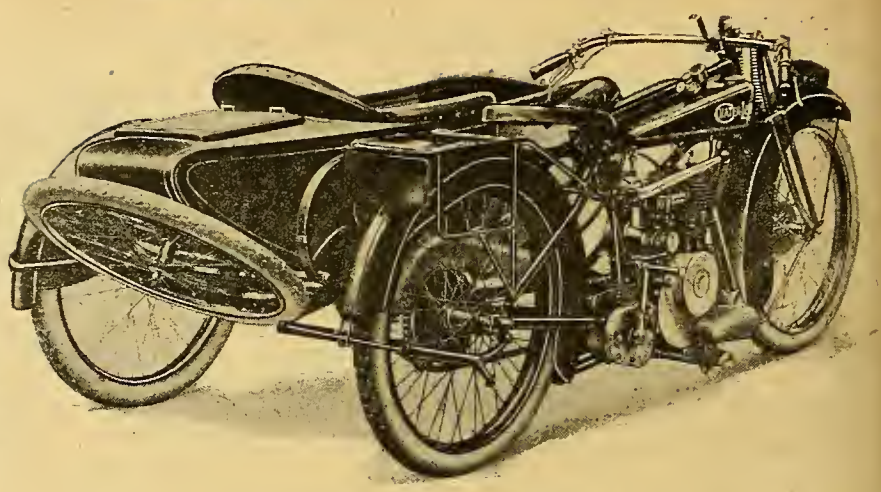
Several Singles and a Big Twin.

2¾ H.P. MODEL.—71×88 mm. (348 c.c.); single cyl. four-stroke; side valves; drip feed lubrication; B. and B. carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2¼in. tyres. Price: Solo, £65.

CHATER-LEA, LTD., 74-84, Banner Street, Golden Lane, London, E.C.1.—A very excellent example of the popular 350 c.c. type of solo mount, possessing many excellent features, such as interchangeable front and back wheels, a specially strengthened steering head with ¼in. balls, most efficient mudguarding and internal expanding brakes fore and aft. Sand-blasted chain guards of very neat appearance protect the two chains, while the silencing arrangements have been carefully designed, there being a large expansion chamber situated towards the rear of the system. The motive power is the popular 348 c.c. Blackburne engine with side valves. The o.h.v. model is offered at £7 10s. extra. The tank is of ample dimensions, containing two gallons.

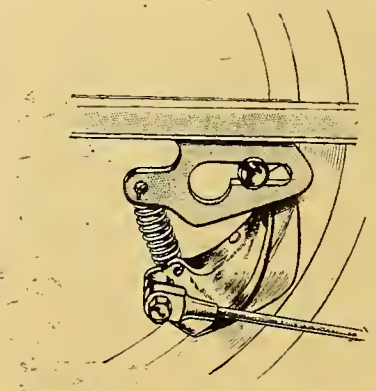
4¼ H.P. MODEL.—85×96 mm. (545 c.c.); single cyl. four-stroke; side valves; drip feed lubrication; Amac carburetter; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2½in. tyres. Price: Solo, £75; with Sidecar, £100.

A thoroughly practical double-purpose mount of the 600 c.c. class fitted with



Equipped with spare wheel, the 545 c.c. Chater-Lea and sporting sidecar make an attractive medium-weight outfit.

all the refinements embodied in the model previously described, possessing in common with it adjustable handle-bars, while the same specially strengthened head is utilised, but in this case the balls are $\frac{5}{16}$in. in diameter. It is worthy of



Details of the rear brake on the Chater-Lea, showing the sliding adjustment provided.

mention that the engine is Chater-Lea's own manufacture, and is particularly well finished. In the case of this machine the silencing expansion chamber is carried close up against the forward portion of the crank case and consists of a large aluminium casting. Naturally, the wheels are interchangeable, remarks which apply also to the sidecar wheel. A spare wheel and tyre complete can be supplied. Other details are the same as those in the model previously described, but it may be mentioned that a M-L Maglita set can be supplied as an extra.

The well-known two-stroke and the big twin sidecar are also exhibited, the prices being, for the two-stroke £40. £43 and £47 10s. for plain two-speed, plus clutch, plus kick-starter respectively, and £115 for the sidecar outfit.

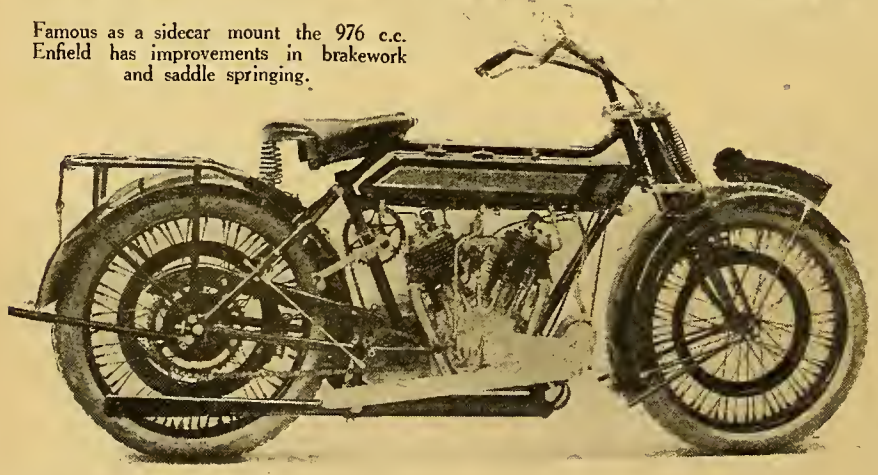
ROYAL ENFIELD. (107.)

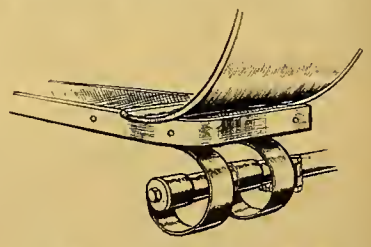
Big Sidecars and Solo Two-Strokes.

8 H.P. MODEL.—85.5×85 mm. (976 c.c.); V twin cyl. four-stroke; side valve; mechanical lubrication; Amac carb.; chain-driven mag.; 2-sp. gear; clutch and hand starter, all-chain drive; 700×80 mm. tyres. Price, with Sidecar, £120.

THE ENFIELD CYCLE CO., LTD., Redditch.—Unstinted admiration is accorded by all observers, critical and otherwise, to the models displayed on the Enfield stand,

Famous as a sidecar mount the 976 c.c. Enfield has improvements in brakework and saddle springing.

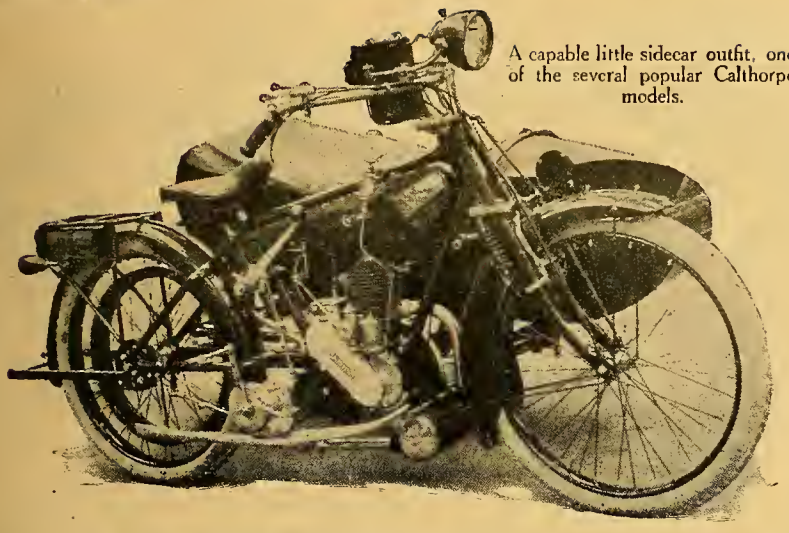




On the 976 c.c. Enfield the front end of the footboards are suspended on springs.

especially to the 976 c.c. twin cylinder sidecar outfit. The engine of this deservedly popular machine is made specially for it by Vickers, Ltd., and the well-known Enfield system of two-speed gear, obtained by means of selective cone clutches and two chains from the engine to the countershaft, has now been before

The Olympia Show.—



A capable little sidecar outfit, one of the several popular Calthorpe models.

the public for many years and has proved itself very thoroughly in practice.

A feature of these machines differentiating them from most others is hand-starting through the countershaft. A Terry spring seat is now fitted on large coil springs mounted on the carrier. A ratchet lock for the foot brake is also fitted. Such features as the silencer and mudguards are of ample dimensions and admirably carried out. The footboards, which are large and comfortable, are rubber studded; and special guards are provided for the protection of legs and feet. An example of this machine with G.P.O. delivery van is also shown.

2¾ H.P. MODEL.—64×70 mm. (225 c.c.); single cyl. two-stroke; petroil lubrication; Amac carb. chain-driven magneto; Enfield 2-sp. gear; clutch and kick-starter; all-chain drive; 24×2¼in. tyres. Price: Solo, £50.

The 225 c.c. 2-stroke lightweight models are, for the most part, unaltered except as regards their prices, which have followed the general decline. They are shown both as sports and touring models, and the protection for legs and feet and general comfort provided on the latter will appeal strongly to the all-weather long-distance rider

CALTHORPE. (104.)

Two-stroke Models.

2½ H.P. MODEL.—67×90 mm. (245 c.c.); single cyl. two-stroke; sight feed lubrication; Mills carb.; chain-driven mag.; 2-sp. gear; clutch and kick-starter; chain-belt drive; 24×2¼in. tyres. Price: Solo, £40.

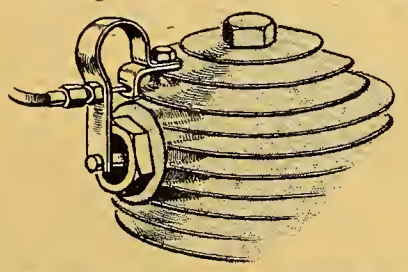
THE CALTHORPE MOTOR CYCLE CO., Barn Street, Birmingham.—Several details are worthy of attention on the smallest Calthorpe. Six-inch mudguards are fitted, and the protection for the rider is really remarkable for such a small and light machine.

An aluminium silencer of good dimensions is disposed inconspicuously beneath the engine, and the exhaust is carried well away to the back. The rear wheel brake, heel-applied, is remarkably simple and effective in its arrangement, there being no rods or superfluous connection whatever.

A direct belt-driven model which is marketed at the popular price of £30 is also shown.

3 H.P. MODEL.—75×79 mm (349 c.c.); single cyl. two-stroke; sight feed lubrication; B. and B. carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain-cum-belt drive; 26×2¼in. tyres. Price, with Sidecar, £75.

There is also a small light sidecar outfit at a very attractive price. The two-stroke engine is of 349 c.c., and the



Extremely neat single-spring, cable-operated Calthorpe release valve.

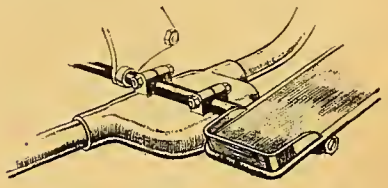
example shown upon the stand is fitted with the M-L Maglita lighting set, the price with this addition being £87 10s.

O.K. (79.)

Four-Strokes and Two-Strokes.

2¾ H.P. MODEL.—71×88 mm. (348 c.c.); single cyl. four-stroke; overhead valves; drip feed lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2½in. tyres. Price: Solo, £76.

Few better examples of the 350 c.c. solo mount are to be seen in the Show than the 348 c.c. Blackburne-engined O.K. Built on thoroughly conventional lines, well mudguarded, and with many points of convenience well studied, it should appeal to the sporting rider. The gear box fixture is worthy of note, since not only is there a longitudinal adjustment by means of a drawbolt, but set screws allow a certain variation to be made so that perfect chain alignment may be ensured. The side valve-engined model is similar in every detail except the engine, the addition of footboards, and



Silencer attached to foot-rest bar on the O.K.

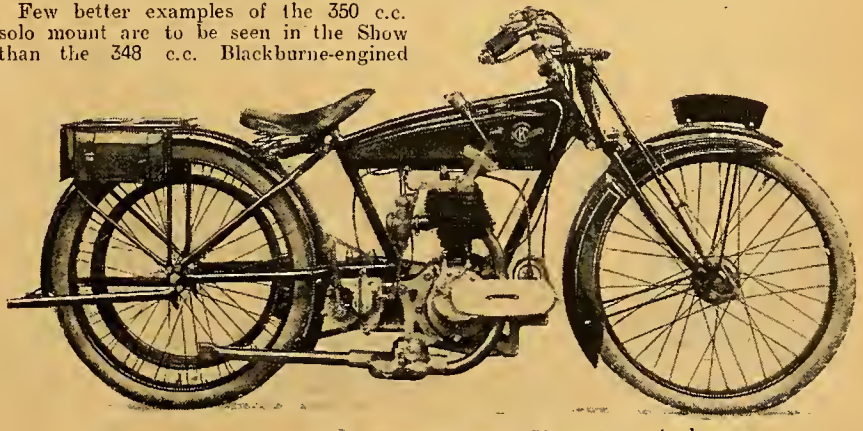
slight modifications in the silencing arrangements. The side valve model costs £65 10s., or with two speeds only £55 10s. The three-speed with sidecar costs £83.

2¾ H.P. MODEL.—70×76 mm. (292 c.c.); single cyl. two-stroke; drip-feed lubrication; Sen-spray carb.; chain-driven mag.; single gear; direct belt drive; 26×2¼in. tyres. Price: Solo, £35.

Quite the most attractive feature about this machine is its price. It is nevertheless well constructed, and a good example of the simplest form of motor bicycle. The tank has a solid pressed steel nose, and this year the model has been improved by the fitting of adjustable footrests, while the heel-operated brake pedal can be similarly adjusted to conform therewith.

2¾ H.P. MODEL.—70×76 mm. (292 c.c.); single cyl. two-stroke; drip feed lubrication; Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; all-chain drive; 26×2½in. tyres. Price: Solo, £56 10s.; with Sidecar, £74 10s.

For a long time Humphries and Dawes, Ltd., have specialised in the low-powered inexpensive sidecar outfit, which they have brought to a high degree of perfection. Their latest model 292 c.c. sidecar outfit is a thoroughly well-thought-out machine. The gear box fixing and adjustment are carried out in the same manner as in the Blackburne-engined model. With this



An attraction of the big O.K. range—the 249 c.c. Blackburne-engined mount.

The Olympia Show.—

machine comfortable aluminium footboards are provided, and a very excellent system of silencing the exhaust, the expansion chamber being beneath the crank case of very large dimensions and divided into two halves, and L-shaped. The exhaust gases pass through a very long exit pipe with flattened ends. A compensating shoe brake applied to a dummy belt rim is fitted to the rear wheel, while on the front is an internal expanding brake of the firm's own design. This is a very nice piece of work, and is provided with a felt washer to exclude oil from the bearing surfaces.

SUN. (100.)

Rotary Valve Two-Stroke.

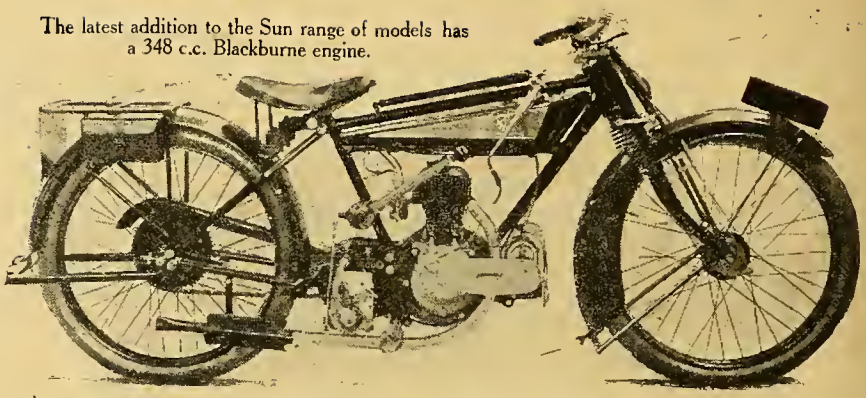
2¾ H.P. MODEL.—67×70 mm. (247 c.c.); single cyl. two-stroke; rotary valve; drip feed lubrication; B. and B. carb.; chain-driven mag.; 3-speed gear; clutch and kick-starter; chain drive; 26×2¼in. tyres. Price: Solo, £49 10s.

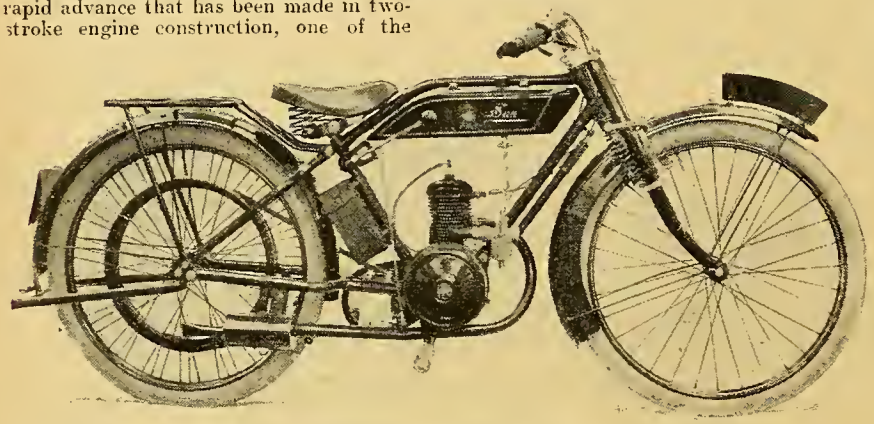
SUN CYCLE AND FITTINGS CO., LTD., Aston Brook Street, Birmingham.—In the rapid advance that has been made in two-stroke engine construction, one of the most interesting innovations was the incorporation in the Sun-Vitesse engine of a rotary valve regulating the inlet port in the crank case. The details and working of this engine can be studied from a sectioned model shown on the stand.

The single-speed 147 c.c. Villiers-engined model is very attractive from the point of view of those who are seeking for real simplicity. Moreover, this machine is really light, as anyone can satisfy himself by lifting the example shown. It scales only 98 lb. when fitted with two-speed gear, whilst the single-speed model weighs but 86 lb. In addition to these models, machines are also staged fitted with J.A.P. and Blackburne engines.

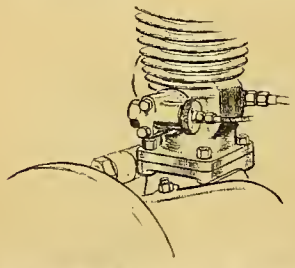
Features to be noted on the larger Sun-Vitesse models are the internal expanding brakes, transmission shock absorbers in the rear wheel, and their well-balanced lines generally.

The latest addition to the Sun range of models has a 348 c.c. Blackburne engine.





Produced by lightweight specialists—the Sun miniature.



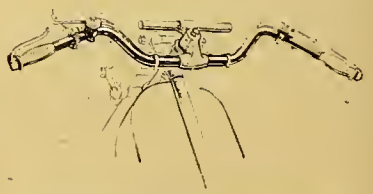
Extra air valve of the Sun on the side of the cylinder.

MASSEY. (29.)

Concentrating on 350 c.c. Solos.

2¾ H.P. MODEL.—70×90 mm. (346 c.c.); single-cyl. four-stroke; side valves; hand pump lubrication; Cox-Atmos carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain drive; 26×2½in. tyres. Price: Solo, £75.

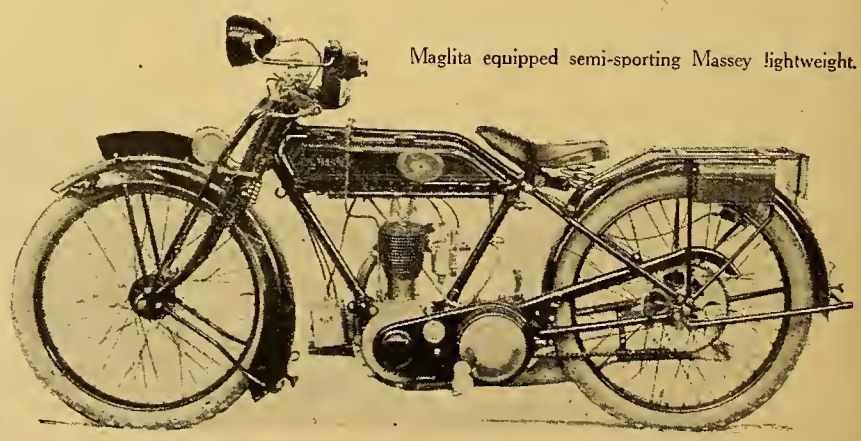
MASSEY MOTOR CO., LTD., Belgrave Road, Birmingham. — Three Massey models are shown, all very much alike in appearance and specification. Proprietary engines are used—the super-sports J.A.P. in the case specified—and Burman three-speed gear boxes, but the resulting machines are wonderfully distinctive in appearance. Careful frame design accounts for this to a great degree; superfine finish also plays its part. The lubrication is automatic, no sight feed being fitted, but otherwise the specification follows very conventional lines. Internal expanding brakes are fitted front and rear, and extremely neat chain covers.



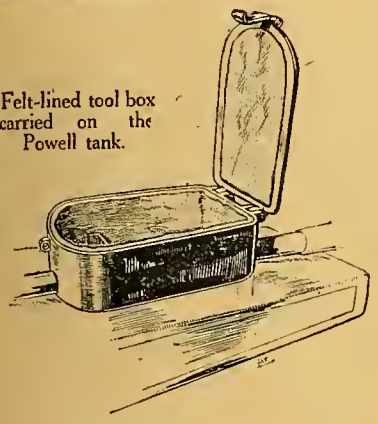
An additional bar for the mounting of instruments is provided on the Massey.

Also shown are a 348 c.c. J.A.P.-engined sidecar outfit at £92 10s., and a 349 c.c. Blackburne solo machine at £70. Specialisation on one type of machine has, in this case, had the very obvious effect of perfecting that type as far as it is possible.

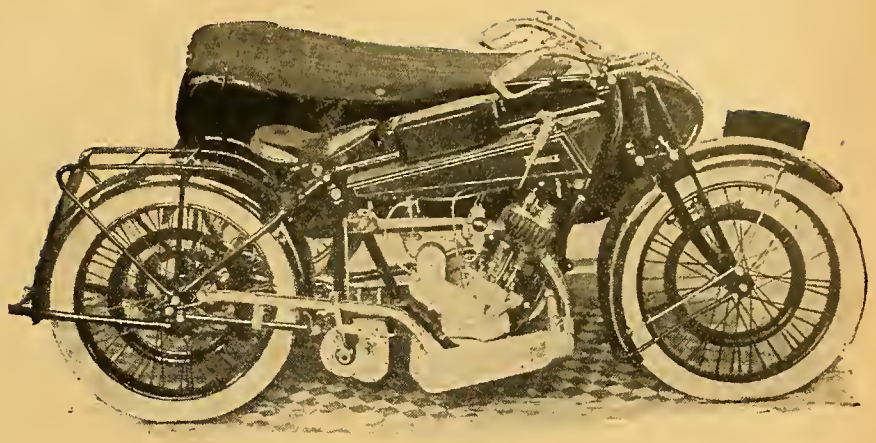
Maglita equipped semi-sporting Massey lightweight.



The Olympia Show.—



Felt-lined tool box carried on the Powell tank.



Chain-driven big single Powell sidecar outfit.

ARIEL. (106.)

From 250 c c. to 1,000 c.c.

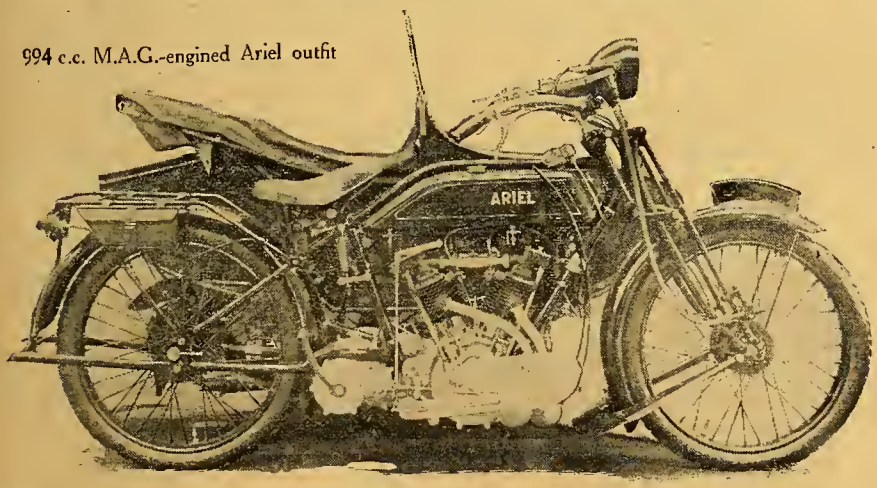
2½ H.P. MODEL.—60×88 mm. (249 c.c.); single cyl. four-stroke; side valves; drip feed lubrication; B. and B. carb.; chain-driven mag.; 2-sp. gear; clutch and kick-starter; all-chain drive; 26×2¼in. tyres. Price: Solo, £57 10s.

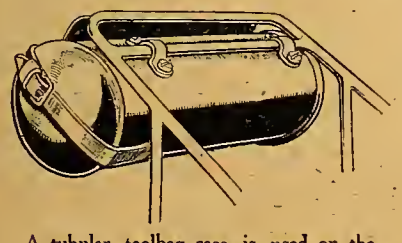
ARIEL WORKS, LTD., Bournbrook, Birmingham.—The full range of Ariel models shown at Olympia comprises machines from the new 249 c.c. lightweight up to the 994 c.c. twin M.A.G.-engined sidecar outfit, and of this comprehensive series the lightweight model is not least in importance. The engine is a Blackburne, and the general lines of the machine are most pleasing. The brake work has been well and carefully carried out, a powerful front wheel brake operating on a dummy rim being fitted and the rear wheel brake being applied with trailing action. The dimensions of the aluminium silencer and disposition of the exhaust piping are also admirable.

6/7 H.P. MODEL.—73×95 mm. (796 c.c.); two cyl. four-stroke; side valves; drip feed lubrication; Cox Atmos or Amac carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; chain-and-belt drive; 26×2½in. tyres. Price: Solo, £95; with Sidecar, £119 10s.

Examples are staged of both types of twin-cylinder sidecar outfit. The smaller of the two has a 776 c.c. Ariel side valve engine, whilst the larger model uses the well-known M.A.G. of 994 c.c., in which the inlet valves are placed above the exhaust valves; otherwise their specifications are similar. The 796 c.c. model, with chain drive and 28×3in. tyres, costs £5 extra. Care has been taken with the single cylinder models of 498 and 665 c.c. respectively to render them specially silent. The smaller of these two is shown both as a sports and touring model with final chain transmission.

994 c.c. M.A.G.-engined Ariel outfit





A tubular toolbag case is used on the Sports Ariel.

PEUGEOT. (22.)

High-class Workmanship.

1¾ H.P. MODEL.—52×52 mm. (110 c.c.); single cyl. two-stroke; petroil lubrication; G.R. carb., gear- and shaft-driven mag.; single gear; no clutch or kick-starter; gear and belt drive; 26×2in. tyres. Price: Solo, £55.

PEUGEOT (ENGLAND), LTD., Brompton Road, London, S.W.1.—Easily the most expensive miniature in the Show is the French-built Peugeot. At £55 it costs approximately the same as one or two geared and chain-driven British 350 c.c. solo machines. On the other hand, the workmanship and finish could not be surpassed, and the neat appearance of the power unit is such as will inevitably attract the elderly pedal cyclist.

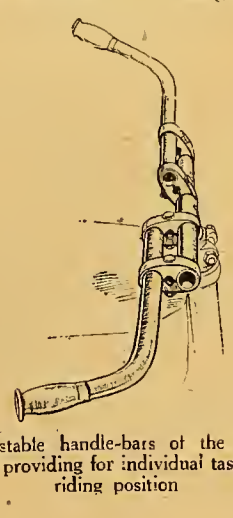
No actual weight figure is available, but it is, almost certainly, the second lightest self-propelled machine on the British market. Approximately one-half gallon of petrol is carried in the tank, and should suffice for nearly 100 miles of average running. Pedalling gear is retained. The wheels are quickly detachable, a feature assisted by calliper-pattern stirrup brakes. A ladies' model, with a semi-open frame, costs £56, the extra £1 being for a clutch, which may be embodied in the standard model for the same price.

J.D. (74.)

Super Motorised Bicycle.

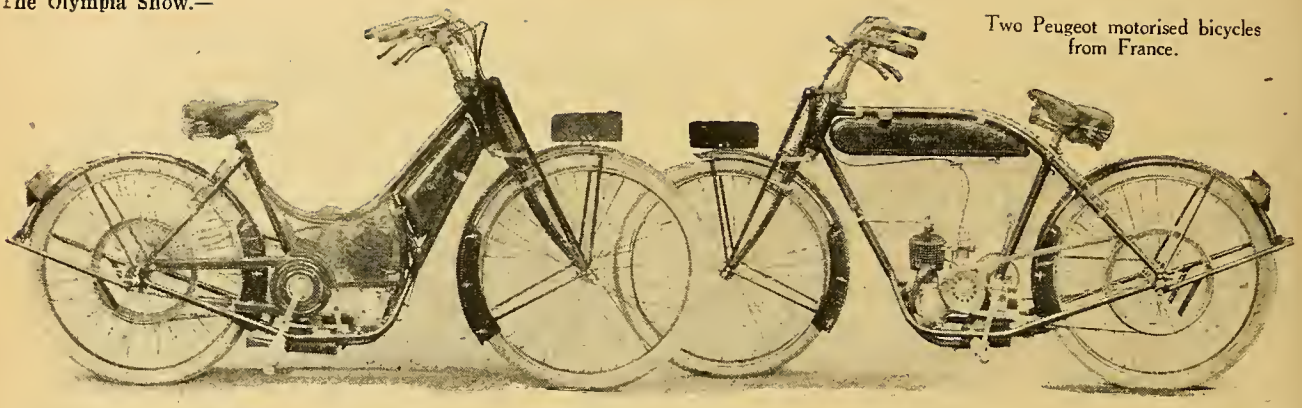
1¼ H.P. MODEL.—51×57 mm. (116 c.c.); single cyl. two-stroke; petroil lubrication; Villiers carburetter; chain-driven mag.; single-speed; clutch, no kick-starter; chain-cum-friction drive; 26×1¾in. tyres. Price: Solo, £35.

BOWDEN WIRE, LTD., Willesden Junction, N.W.10.—Although the J.D. machine is essentially a motor-assisted bicycle, nevertheless it is designed as a



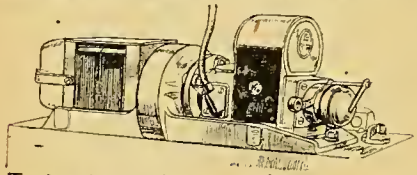
Adjustable handle-bars of the 1923 Dot, providing for individual taste in riding position

The Olympia Show.—



Two Peugeot motorised bicycles from France.

whole, not as an attachment to be fitted to an ordinary bicycle strengthened for the purpose. The engine is particularly well made, the manufacturers assuming that with so small a cubic capacity the power unit would be doing high duty for the greater part of its time, and, therefore, needs to be made better than would be the case with a larger engine. Power is transmitted from the crankshaft to reduction gearing, and thence to a pulley composed of special friction material engaging with what appears at first sight to be a belt pulley attached to the rear wheel spokes. This pulley can be disengaged by a control on the handle-bar when a clutch action is desired, and is held in position by coil spring mechanism acting through a bell crank lever in such a manner that irregularities in the driven rim have no effect upon the drive.



Tandem-driven dynamo and magneto on the Scott Sociable.

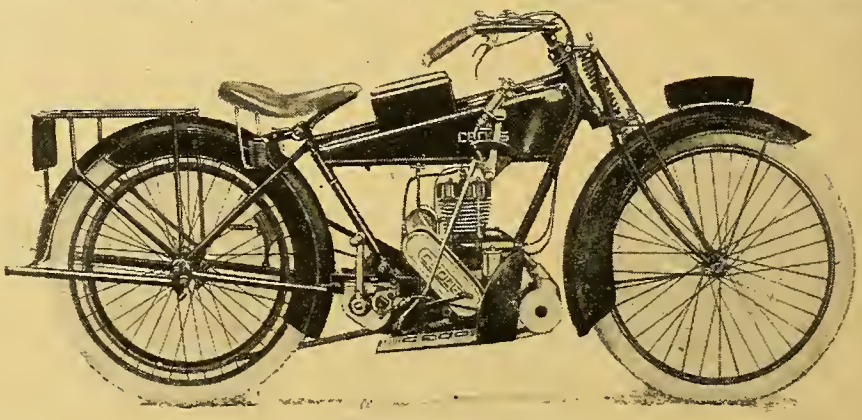
Those who desire to test the efficiency of the friction drive and understand its operation should inspect the working models on the stand driven by electric motors.

CEDOS. (80.)

Detachable Head Two-strokes.

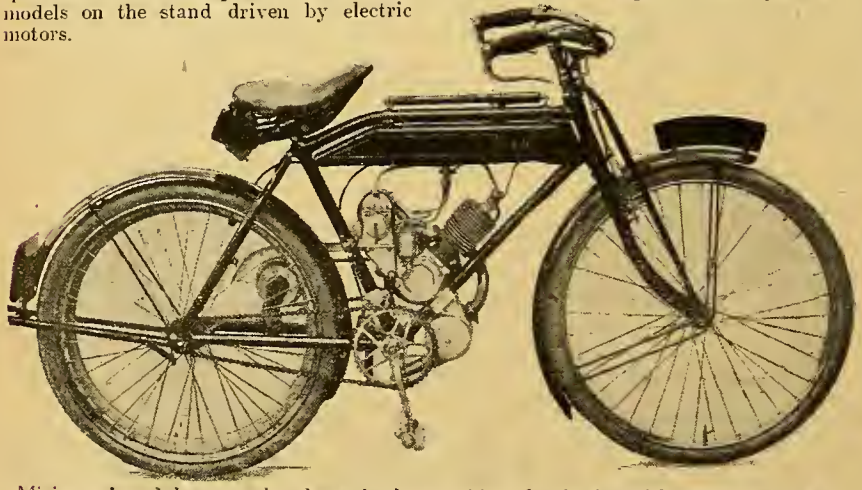
2½ H.P. MODEL.—67×70 mm. (247 c.c.); single cyl. two-stroke; drip lubrication; Cedos carb.; chain-driven mag.; 3-sp. gear; clutch and kick-starter; all-chain drive; 26×2¼in. tyres. Price: Solo, £57; 2-sp. Model, £58; Ladies' Model, £60.

CEDOS MOTORS, Northampton.—Several interesting features are noticeable on the attractive little Cedos two-stroke. Its motive power is one of the few two-stroke engines which possess a detachable head, and it is interesting to note that it is fed with mixture by a carburetter of the firm's own manufacture. The machine has attractive lines, wide handle-bars, giving excellent control, and internal-expanding brakes fore and aft. Not only are comfortable footboards provided for the driver, but there is an undershield, an extension which protects the underside of the engine.

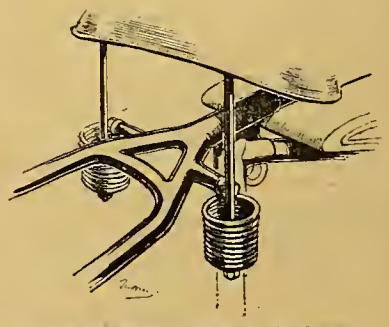


A graceful little mount—the 247 c.c. Cedos, with detachable cylinder head.

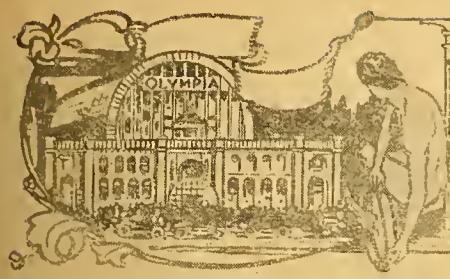
Two variations of this model are the slightly cheaper type with two-speed gear and belt and chain drive (£48), and the ladies' machine, which, of course, naturally has a special open frame and 24in. wheels so as to give a lower riding position. The ladies' model is also in equivalent forms at £59 and £50 respectively.



Miniature intended to appeal to those who do not wish to forsake the pedal cycle entirely—the 116 c.c. two-stroke J.D.



Saddle spring anchorage on the frame of the Hawker.



Sidecar Attachments.

Types at the Show.

A Survey of 1923 Models exhibited by Manufacturers of Proprietary Sidecars.

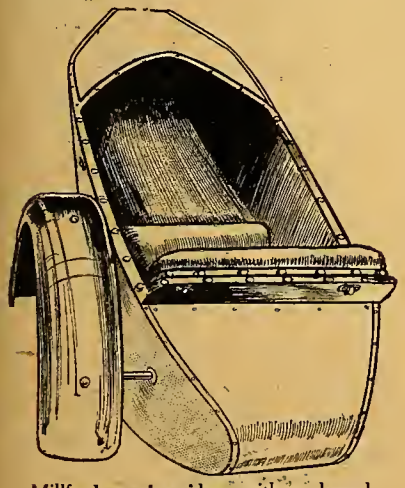
WATSONIAN. (69.)

All Types of Sidecars.

WATSONIAN FOLDING SIDECAR CO., LTD., Birmingham.—The chief exhibit on the Watsonian stand is the new two-seater model. Although sufficient width has been given to allow a normal-sized person and a child to be seated side by side, the chassis is only of normal width. The advantages of the method of seating are very obvious, especially when the extra passenger is a very small child. On the model exhibited an Easting screen, sufficiently wide for protection of the two passengers, is part of the equipment, and the price asked is £29.

The interest manifested by sidecarists in the folding type of chassis is exemplified in the several new patterns on the market. The Watsonian is a well-tried design that will stand hard usage. A folding chassis must, of course, be strongly constructed to be of any use whatever.

There seems to be no end to the delightful little sporting bodies at the Show, and the Watsonian R34 in polished aluminium is no whit behind any in gracefulness of design. A detachable aluminium dash and neat little windscreen give finish to one of the most pleasing of sidecars; the price of this model is £24. In addition to a big range of standard models an exceptionally light racing body and a tradesman's carrier, of well-thought-out design and stout construction, are shown. The latter is listed at £19 10s.

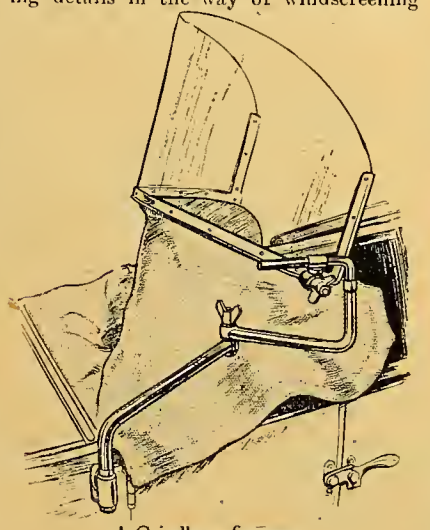


Millford sporting sidecar with mudguard on body.

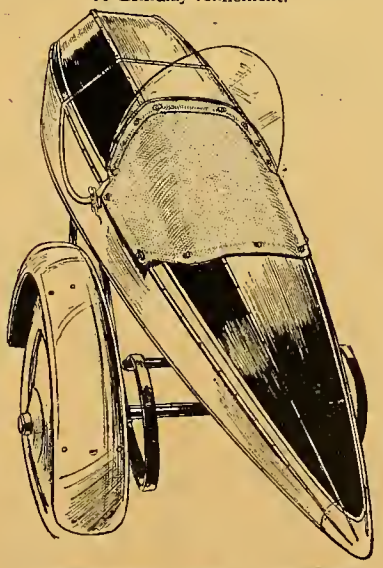
SANDUM. (170.)

Double-Seater Models.

SANDHAM ENG. CO., LTD., 336, Gray's Inn Road, London, W.C.1.—One of the most enterprising of sidecar manufacturing firms, the Sandham Eng. Co., offers for the forthcoming year a range embracing every conceivable type. Interesting details in the way of windscreening



A Grindlay refinement.



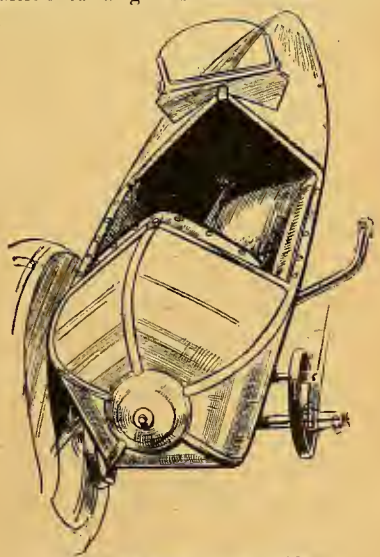
A striking design of sidecar by Montgomery, finished in aluminium.

are numerous, showing that this important item has been studied from actual use of the sidecar, and not from the drawing office. The Sandum Sociable, for instance, was evolved after numerous experiments in body building which cost the firm £250, but the results pay for the trouble entailed, for this model is unquestionably one of the best ever produced of its kind. There is ample room for an adult and child in the rear seat, whilst another child can be accommodated easily in front, tandem fashion. This has been accomplished without sacrificing the compact design of the body or widening the chassis. The price is £30. For dual purposes the tandem-seater is shown with various detail improvements. This model, the rear portion of which falls back and forms an additional seat, permits both passengers to enter by the door; the back rest of the forward seat being easily removable for this purpose. The special feature of the design is that the rear portion folds forward, converting the body into a single-seater. There is a streamline Junior at £14.

MILLFORD. (65.)

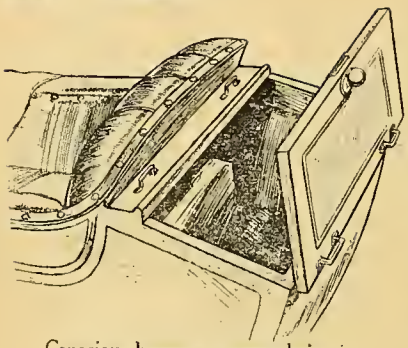
Family and Other Patterns.

MILLS-FULFORD, LTD., Crown Works, Coventry.—Several improvements have been effected in the Millford range of sidecars, the outstanding alterations being chiefly in the big family model. Last year this double-seater was roomy, but the addition of a good-sized bulbous back



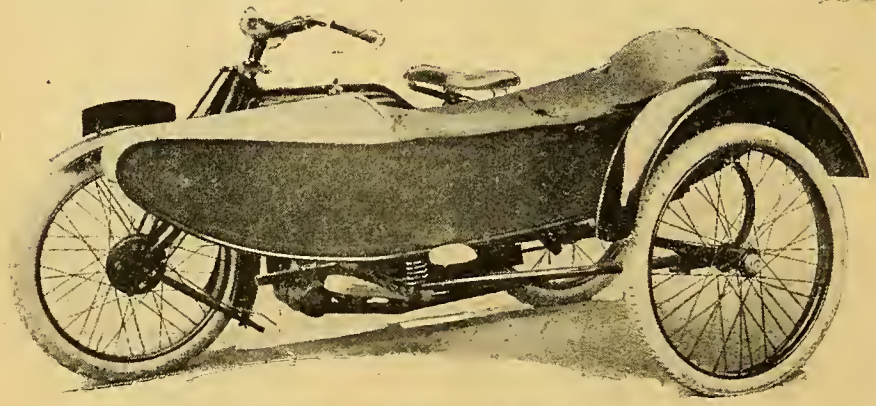
The sporting model Swallow sidecar.

Sidecar Attachments.—



Capacious luggage accommodation is provided on the Sandum.

adds considerably to its effectiveness as a touring sidecar. The greater height, too, of the front back-rest is a decided improvement, and the well for the feet of the rear passenger is a minor alteration that will be acceptable to tall passengers. The important question of price has been studied closely by the makers, and reductions of from £3 to £9 5s. have been effected. In the "Favourite" pattern, for instance, the original £30 has been reduced to £25, and, in addition, all models are sent carriage paid in free crates. Amongst the innovations for 1923 is a little sporting sidecar of taking design marketed at £18 18s. in standard three-ply wood, and at £21 in polished aluminium. The most important and far-reaching alteration is the attaching of the mudguards to the body instead of to the stays. Elimination of rattle is thus effected. The Millford Rock chassisless sidecar is shown at £25; it is one of the most comfortable on the market to-day.



A Whitley sporting sidecar on a 349 c.c. A.J.S.

MONTGOMERY. (42.)

Sports and Touring Types.

W. Montgomery and Co., Coventry.—The Montgomery range is unquestionably one of the most complete in the show. Models of every conceivable type are shown, and the most fastidious buyer will find designs to meet his requirements. If one model can be chosen which attracts more than another it is the racing model with an all aluminium body and scoop-shaped wind-shield, fitted to a dash which gives complete protection and yet offers the minimum of wind resistance. The price is £22 10s.

Superlative finish, the maximum comfort for the passenger, and grace in design are found in model No. 1. It is of low build, yet the back is not too low for comfort; there is ample leg room, and a good locker. This model, fitted on the new underslung chassis, is priced at £26 10s.

A little sporting model which the Montgomery people say "set the fashion in sporting bodies" is offered at £21 10s., and a clean, graceful design it is, weighing only 100 lb. complete.

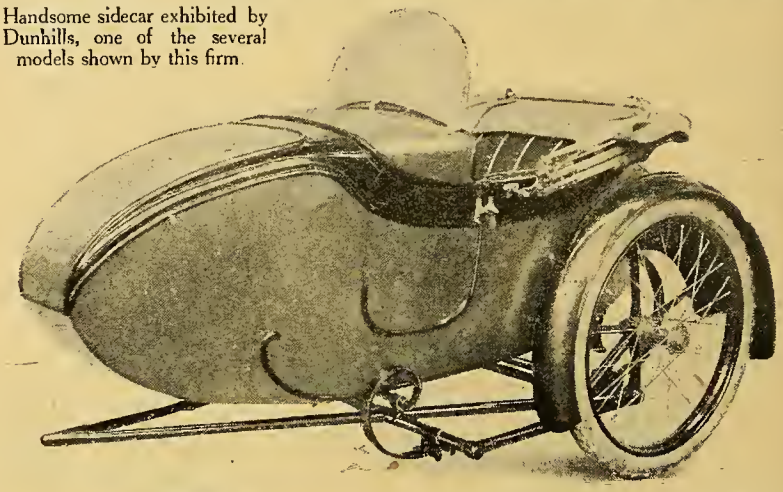
A tradesman's carrier is, of course, provided, differing little from the old and well-proved model. It is light and clearly designed, and listed at £21 10s.—a cheap production considering its fine finish. The lowest priced model is the No. 3, a little sidecar suitable for light-weight machines, and listed at £19 10s. Although low in price it has all the best characteristics of Montgomery products.

RIDEEZI. (163.)

For the Family.

Coleford Motors, Ltd., Rideezi Works, Western Road, Merton.—Every pattern from the lightest and most streamline of racing bodies to the commodious family pattern is provided on this stand. One model that will catch the eye of the family man is the "Champion" two-seater. This sidecar is provided with a dickey which forms a seat big enough for an adult, while there is ample room for a child in the front part of the body. It is sold at £31. A similar pattern to the Champion is listed for £23 2s., but the dickey in this instance is suitable only for a child. Amongst the lightweight models is a smart pattern weighing only 75 lb.; it is listed at £13 13s., and must be good value at that price. It is interesting to observe that all Rideezi sidecars are covered in aluminium at the nose and at the rear to prevent disfigurement by the cracking of the three-ply wood or of the enamel. Also exhibited is an aluminium hood which folds over the rear portion of the body when not in use. This device is neat and instantly put into operation.

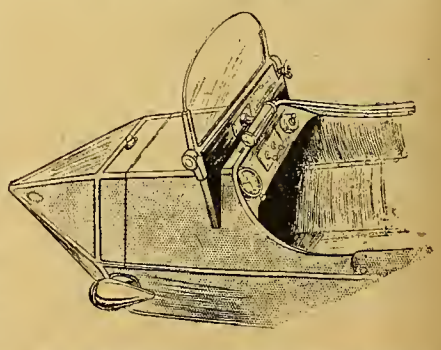
Handsome sidecar exhibited by Dunhills, one of the several models shown by this firm.



KERRY. (304.)

Many Sidecars.

East London Rubber Co., Ltd., 29, Great Eastern Street, London, E.C.2.—Quite apart from the rest of the sidecars (up among the accessories in the Gallery) are shown two of a very complete range offered by the East London Rubber Co., Ltd. The "Kerry" No. 7 pattern is distinguished by its superior finish, both of coachwork and upholstery. A good-sized locker, broad enough at the top to accommodate a fairly large suitcase, is provided. An enclosed wheel underslung type of chassis accommodates



The effective dashboard and screen of the Hawk hexagon sidecar.

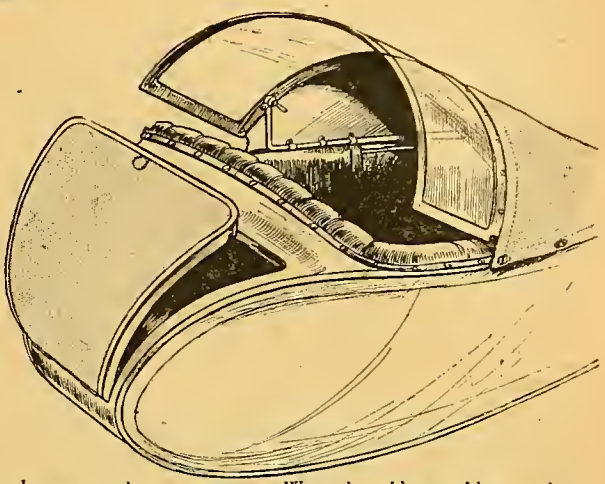
Convertible touring or racing Sheffield-Henderson



Large two-abreast two- eater Watsonian sidecar with capacious luggage receptacle in rear.

this body, the price complete being £23 10s. The other sidecar shown is known as the Tourist No. 9, and is a roomy, well-upholstered model with an extremely well padded hack cushion. Another very desirable feature, none too common on any of the sidecars exhibited at Olympia, is an unusually high back to the seat. This model is listed at £22 15s.

WHITLEY. (120.)

Sports, Trade, and Touring Sidecars.

WHITLEY MFG. CO., LTD., Charterhouse Mills, London Road, Coventry.—Like the majority of sidecar manufacturers, the Whitley Mfg. Co. has this year specialised in a light sporting design, and offer for £15 10s. a model that is extremely good value. At this price four-point attachment and a sensible storm apron are provided. Alternatively, a touring body of the same pattern is offered at the same price. Another introduction is the tradesman's model, a sensibly-sized carrier, stoutly constructed, and not so unwieldy as are many. Judging by the numbers of trade carriers shown, it would seem that an increasing interest is being taken by tradesmen in this form of delivery vehicle. The interest will increase providing manufacturers do not build the bodies too large, thus tempting users to carry more weight than is justified on a sidecar chassis.

A Whitley production of clean and straightforward design is known as Model 12. This sidecar is marked by its fine finished and roominess, and is priced at £24 10s.

A detail of interest on Model 20 is the registered design of the wheel bracket, which permits the spindle to be withdrawn and at the same time provides for the main and under tubes, mudguard stay, and wheel stand all in one casting.

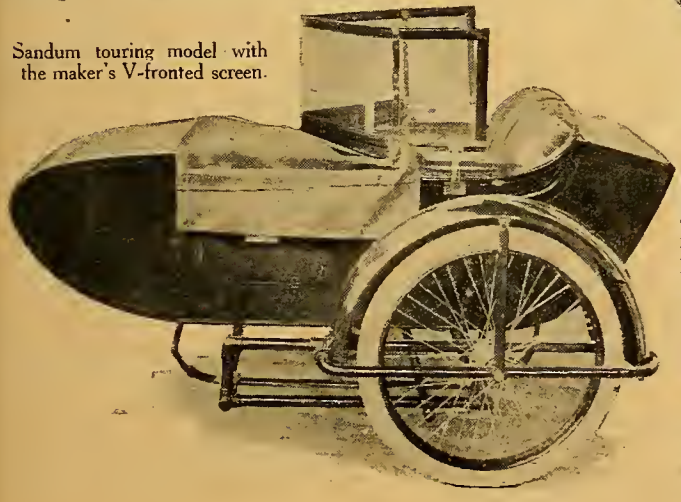
HAWK. (29a.)

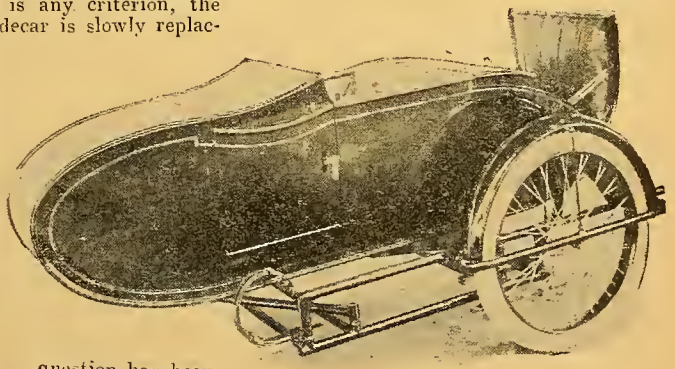
Streamline Bodywork.

HAWK ENG. AND SIDECAR MFG. CO., Hampton Street, Brighton.—If the evidence of the road is any criterion, the sporting type of sidecar is slowly replacing the old high back and broad nose models. In the Hawk range there are to be found streamline patterns which offer the minimum of wind resistance. This question has been closely studied by the designer, and he has found from practical experience that the models he has placed on the market are ideal for the man who wishes to carry the minimum dead-weight and at the same time provide comfort for the passenger and give reasonable luggage space. The most attractive model on the stand is probably the Standard Racing De Luxe, finished in cream, and equipped with a well-fitted dash and a small hood which folds neatly and quickly away when not needed. This model with a body weighing 40 lb. is offered at £25.

In addition to the range of sporting sidecars a tradesman's carrier is offered, and this, too, has been designed with the object of giving as little wind resistance as possible, although providing good accommodation. The price of this model is £25 10s. A standard touring model is also marketed, following similar but more commodious lines to the racing Hawk. This sells at £30.

Sandum touring model with the maker's V-fronted screen.





One of the several Rideezi models—a touring type with dickey seat.

DUNHILLS. (66.)

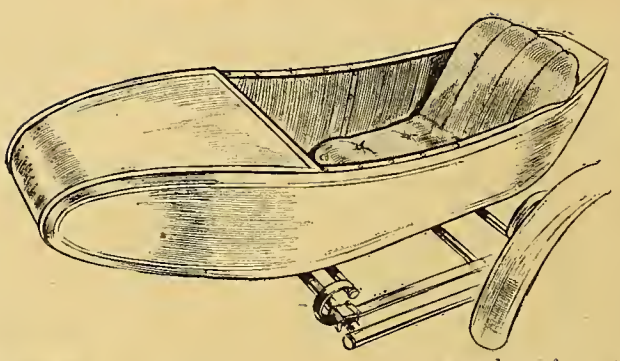
Sidecar Springing with Shock Absorbers.

DUNHILLS, LTD., 359, Eus on Road, London, N.W.—On this stand is one of the most interesting sidecar exhibits in the Show. Apart from the range of models shown, there is one innovation that deserves to become more widely known. This is the B. & D. stabiliser, which eliminates recoil and permits the introduction of more flexible coil springs than could otherwise be used. This device can be fitted on the majority of models, and unquestionably

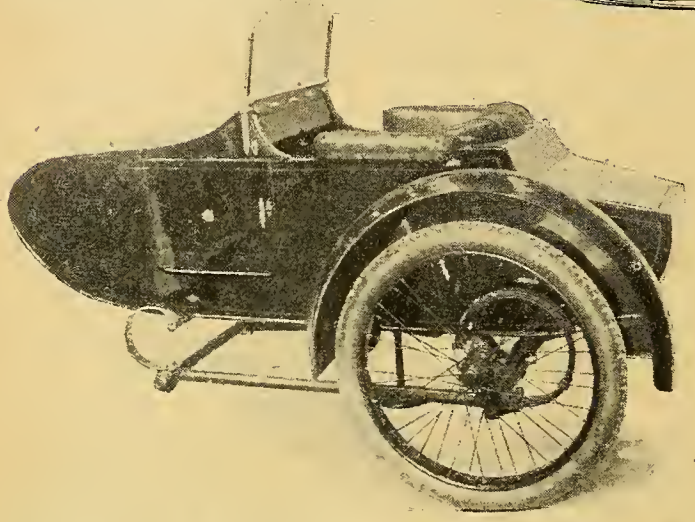
Sidecar Attachments.—

adds to the comfort of the passenger on bad roads.

Among the models which have proved their worth this year is the double-seater, a design ingeniously incorporating hammock seating for the front passenger. Although an extraordinary amount of leg room is provided the passenger the body might be mistaken for a single-seater. The price for this finely



New sports model Rideezi sidecar with hammock seat cushion and aluminium top panel.



Locker capacity has not been overlooked in the Hughes touring sidecar.

finished model is £35. The B39 is another graceful and commodious model, and should suit the tastes of the most fastidious. The sidecar shown is finished in Harley-Davidson green, and is equipped with a neat semi-circular screen and efficient hood. Its price is £32 10s. An entirely new sporting model is offered on the well-known Dunhill triangulated chassis at £20.

GRINDLAY. (39.)

Spring Wheel and Sports Sidecars.

GRINDLAY, LTD., Spon End, Coventry.—The Grindlay range of sidecars is complete and workmanlike. An introduction is a chassis which encircles the hub suitable for interchangeable wheel outfits, while the rear spring-slides on the cantilever chassis have been abandoned, the springs now being pivoted. Probably the most striking exhibit on the stand is the Club model, a well-designed sidecar with a polished aluminium dash suitable for any powered machine. A slight alteration to the locker on this model provides greater luggage accommodation. The Club model with spring wheel sells at £30, but with the new enclosed wheel chassis the price is £26. Another likeable body is attached to a light chassis and finished in primrose. Its rakish lines are suitable for a sports mount and should attract the speedman who wants a sidecar light in weight and offering small wind resistance. For £16 15s. a lightweight touring model is offered which is suitable for hard work with any type of machine up to 500 c.c.

CANOELET. (160.)

From Taxis to Lightweights.

MEAD AND DEAKIN, Tyseley, Birmingham.—The selection of Canoelet sidecars offered by Mead and Deakin is exceptionally complete and is very wide in its appeal, no fewer than eight being staged. All the models are distinguished, too, by their graceful lines and beautiful finish. Another point which marks the care in production is the variety in chassis design, which seems to have been considered in conjunction with the type of body used.

One of the most attractive of all is the M.M. 4 touring model, finished in mauve and equipped with deck and windscreen and a hood of light design, the latter being a new pattern. The A4, a semi-sports model in the Indian red, elaborately lined with gold and fitted with torpedo apron and screen, should satisfy the owners of Indian Scouts and similar fast machines, for the body can be finished in any colour.

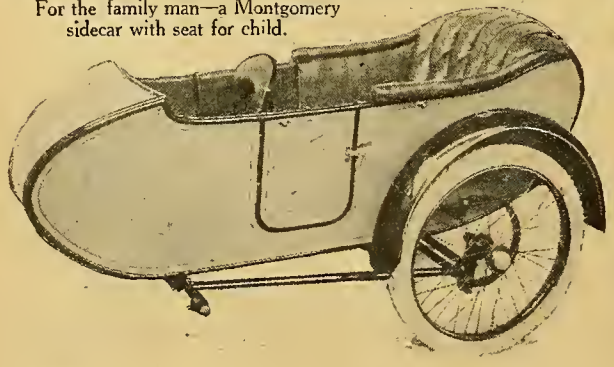
In great contrast to these models is the Taxi sidecar, a huge affair, but no doubt comfortable, selling at £85. For the owner who requires the minimum of body weight there is a little black and gold sidecar, clean cut in design—as indeed all the Canoelets are offered—for £16 5s.

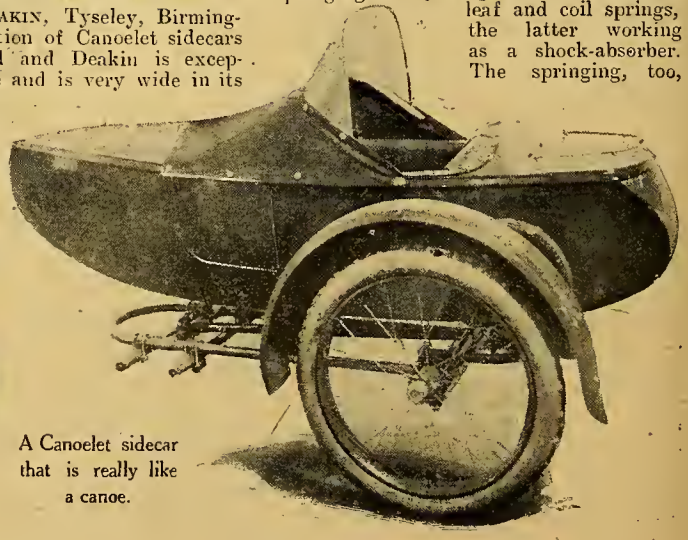
HENDERSON. (165.)

Leaf and Coil Springing.

HENDERSON MOTORS, LTD., 73, Fitzwilliam Street, Sheffield.—Models ranging from £17 10s. to £35 are shown on the Henderson stand, and though each model is interesting as bearing its own particular characteristics, the "Elite" chassis is one of the most striking things among the sidecars exhibits. The rear springing is by a pair of combination leaf and coil springs, the latter working as a shock-absorber. The springing, too,

For the family man—a Montgomery sidecar with seat for child.





A Canoelet sidecar that is really like a canoe.

The best tyre in 1923

will be the NEW DUNLOP CORD

Because—

1.—it gives the *motor-cyclist* all the advantages of Dunlop multiple-ply cord construction so pronounced in Dunlop Cord *motor* tyres.

2.—this cord construction adds miles to the life of the cover, making it cheaper, on a cost-per-mile basis, than any previous type.

3.—it carries the finest tread yet devised, providing a sure fore and aft grip of the road under all conditions.

4.—it adds comfort to riding, possessing much greater cushioning capacity than tyres of the canvas type.

Sidecar Attachments.—

is adjustable for any weight and clearance. Among the sidecar exhibits which impresses itself as being particularly well thought out is the "Sports" model at £20. The makers maintain that perfect steering at any speeds is obtainable with this design. The lowest-priced sidecar on the stand is the "Featherweight," listed at £17 10s.

DORWAY. (113.)

Folding Chassis.

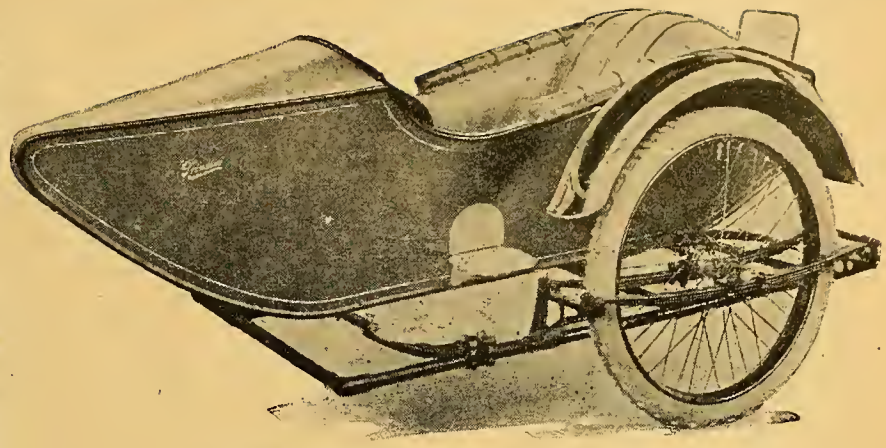
THE DORWAY SIDECAR CO., 345, Bell Barn Road, Birmingham.—The advantages of the folding chassis are so obvious that the wonder is, not that many firms are now specialising in this form of sidecar, but that more are not in general use. The Dorway chassis, which was very fully dealt with in the issue of *The Motor Cycle* for October 19, is robust in design and carefully thought out in every detail. The chassis, complete with a roomy body, sells for £28.

SWALLOW. (180.)

Graceful Sports Model.

SWALLOW SIDECAR CO., Bloomfield Road, Blackpool.—Amongst the most distinctive sidecars in the Show are the sporting Swallows in polished aluminium.

Although light and "racy" in appearance, the construction is strong and suitable for machines of any power. Many sporting bodies are fitted to chassis obviously unsuited for machines of larger capacity than 500 c.c., but in this instance the designers have rightly met the demand for strength from owners of powerful twins, as well as merely providing grace of outline with minimum wind resistance.



Grindlay sporting Club model, light but strongly made.

All the models are provided with a windscreen of the aeroplane type, consisting of a small semi-circular Triplex panel mounted in aluminium. Included in the equipment is a small quickly detachable hood, which may be erected in a very few seconds. It is carried in the locker at the rear.

HUGHES. (144.)

Four Models to Suit All.

THOS. HUGHES AND SON, LTD., Baker Street, Sparkhill, Birmingham.—The policy of Hughes & Son., Ltd., for the coming year is to provide a short range of models, each one suitable for various-powered machines.

For powerful motor cycles the "Cruiser" is offered for £30, a model of striking design and fine finish, equipped with dash and screen. Of a more commodious pattern is the "Standard" touring model, at £24. This, too, is fitted on a chassis strong enough for any-powered machine yet not unduly heavy. A really fascinating little model is the "Torpedo," which combines grace of outline with a fairly commodious body, and at the same time is light. This sidecar is listed at £23. For £17 10s. the "Lightweight" is good value.

WHAT NOT TO MISS.

The Swallow sidecar with concealed hood—actually it is removable and stowed away in a locker.

The several Bradshaw engined solo mounts.

The 976 c.c. Coventry Eagle—one of the cleanest big twins in the Show.

The £28 10s. 6d. Excelsior lightweight, fresh from Bwlch y Groes.

The O.E.C. limousine coupé sidecar attached to a wheel-steered bicycle.

The sprung wheel Gnome-Rhone sidecar.

The new skew gear Rudge four-speed box.

The dual spring fork of the latest Harley-Davidson.

The 733 c.c. Douglas sidecar, with sliding screen and pillion carrier seat as standard.

The post office red Campion sidecar.

The Millford tandem-seated sidecar.

The Harper, Ner-a-Car, Morgan, T.B., and New Hudson chassis.

The new B and B twist grip controls for existing machines.

The Coventry Victor louvre type adjustable leg shields.

The dove-grey Francis-Barnett T.T. machine.

The Sandum all-weather hood with V screen.

The 976 c.c. Zenith sports sidecar outfit.

The 38 lb. "T.T." lightweight on the Clement stand.

The 25-guinea Sirrah.

The £67 10s. 499 c.c. Abingdon.

The "Oversize" Watsonian sidecar, which seats an adult and child side by side, and has a commodious dickey.

The little overhead valve Weaver.

The "all-enclosed" model of the P. & P.—the hoseable mount.

The shaft-driven G.S.D.

The new Triumph lightweights.

The tower of fins on the small Martinsyde.

The Metro-Tyler polished aluminium saloon sidecar finished in Bedford cord and having wireless equipment.

The single-cylinder Matchless, which suggests a revival of Matchless competition in the Tourist Trophy Races.

The Coupette—a folding fixed type hood among the Lea-Francis exhibits.

The handsome sporting Canociet sidecar with scuttle screen and rear deck rail.

The grey 349 c.c. B.S.A. at 55 guineas.

The novel method of indicating the features of the Excelsior by streamers suspended from the archway of the stand.

The new 349 c.c. three-speed Sunbeam.

The sporting P. & M. Panther sidecar outfit.

The 348 c.c. Raleigh at £55.

The Motor Cycle photographic transparencies. (Stand No. 70.)

SIDELIGHTS OF THE SHOW.

Jottings of Interest at the Annual Olympia Exhibition.

CIGAR-SHAPED sidecar bodies of polished aluminium would appear to be the accepted standard in sporting sidecars.

Introducing another Saturday into the Show "week" is a popular innovation, judging by the crowd of visitors on the opening day.

The palm for finning we award to George Brough and his "S.S.80 Superior" model. Besides liberally finning the exhaust port, there is quite a goodly collection of fins on the pipe itself—"getting quite fishy," a wag remarked.

Records and rumours of records were in the air at Olympia on Friday whilst stand attendants were busily staging their wares.

The enterprising French firms who have come over for the Show demonstrate Continental advance in design and construction of motor cycles.

Dope is a favourite topic of conversation among the speed men who foregather at the Show. Promises of another 10 m.p.h. are made by those now experimenting with fuel mixtures.

One may pay as little as £28 and as much as £45 for a lightweight of similar outward design.

Sidecar or runabout—which shall it be? This problem still keeps buyers (and their spouses !) busy.

One hears less of mass production of a single model these days. Rather is it the case that makers provide a range of patterns to satisfy all tastes.

Many manufacturers would prefer the Show earlier in the year—September is the month favoured in some quarters.

Show visitors have an opportunity of noting the progress made with the Extension to the Olympia building on the Hammersmith Road side. Next year it will enable the Car Show to be arranged in one building, instead of splitting the Show between Olympia and the White City as in the last three years.

The Cedos will be to the fore in 1923. A new private company to handle it is being formed next week.

Circulation of the Show issues of *The Motor Cycle* :—

Nov. 9th	... ...	129,001
Nov. 16th	... ...	132,411
Nov. 23rd	... ...	140,322

All-weather finish is becoming the vogue.

Quite a large number of visitors to the Show on Saturday were tempted to journey up by road, the weather being fine and the roads dry.

Rudge machines have either four or twenty speeds in 1923.

Real improvements are observable in sidecars for 1923. Passengers will appreciate the conveniences arranged for map and goggle accommodation, and also the weather-protecting devices.

Even on Friday morning the staging of the exhibits at Olympia was well advanced.

The descriptions of 1923 models in this issue, as well as the review of accessories, were prepared by "THE MOTOR CYCLE" staff subsequent to a personal examination of the Olympia exhibits. It is the most complete review of the annual Olympia Exhibition, embracing in one issue every motor cycle, sidecar, and three-wheeled runabout.

A Press-day, as at the Car Show, would be a much-appreciated innovation at the Motor Cycle Show next year.

At the manufacturers' banquet on the eve of the Show, Sir Harold Bowden, referring to reduced prices for 1923, recalling a famous remark, said that he did "not know what the public would think of prices, but, my God, they frighten me."

This year's exhibition is a real value-for-money show.

The daily press photographers were, as usual, eagerly sorting out the freakish designs on the opening day.

Step quietly on to the Indian stand, make a noise like an order, and you may receive a handsome little cigarette holder.

There are more foreign visitors to the Show than usual; representatives from many countries have arrived for the most important motor cycle exhibition in the world.

The smallest engine in the Show is the 43 c.c. Clement.

THE MOTOR CYCLE EXHIBITION
at
OLYMPIA
will remain open to the public until Saturday next (December 2nd).
300 manufacturers are represented and over 1,000 vehicles on view, together with 10,000 components.
It is open each day from 10 a.m. to 9 p.m., and the admission charge is 2s.

Many considered the motor cycle manufacturers' banquet more interesting in the quality and interest of the speeches than the car manufacturers' banquet a month ago.

Brooklands fairly buzzed with excitement up till closing time on Saturday, and many records went by the board. The track is now closed for necessary repairs.

Still too many stand attendants know little of the machines they represent. Even bore and stroke floors many of them.

Next year, many motor cyclists would like to see the banishment of guineas for prices and initials for names.

With the arrival of the G.S.D., the J.D., the P. and P., and the H.T., all newcomers to Olympia, there is a perfect medley of initial names of motor cycles.

Sidecars should enjoy great popularity in 1923, thanks to the attention of designers to the all-important question of weather protection. Many really commendable examples of all-weather sidecars are displayed at Olympia this week.

A T.T. for 150 c.c. motor cycles is not so distant as one might suppose. There is quite a range of such machines at the Show.

Further cuts in prices were being mooted on Monday afternoon.

Working models are to be found on many stands demonstrating the action of engines and gears.

Young and old, male and female, jostled together to obtain a glimpse of the latest motor cycles on Saturday afternoon and evening.

Somebody has been complaining that he stepped into the Show and lost £40. It turned out that the cut figure at which he was advertising his 1922 second-hand machine was considerably more than the manufacturers were charging for the same model electrically equipped.

As mentioned in our report, the Duzmo was an absentee on Saturday. One model turned up on Monday morning.

Before the war it was possible to obtain a single-geared lightweight for £23 10s. This year a machine of similar quality, but with much better equipment, is shown at £26 5s.

How the Show appeals to boys of fourteen—the finest that ever was or ever will be.

Quite a number of people are walking about with cigarette cases bearing the well-known Rudge-Whitworth symbol.

RUNABOUTS AT OLYMPIA.

Six Machines which may be regarded as Substitutes for the Sidecar Outfits and Two Solo Machines on Similar Lines.

HARPER RUNABOUT. (122.)

Solo Three-Wheelers.

2½ H.P. MODEL.—70×70 mm. (269 c.c.); single cyl. two-stroke; petroil lubrication; Zenith carburetter; flywheel mag.; 3-sp. gear; clutch and lever-starter; chain drive; 2¼in. tyres. Price £100.

R. H. CARLISLE AND CO., LTD., 188, Deansgate, Manchester.—The Harper runabout stands in a class by itself. Its designers, recognising the demand for an exceptionally light, handy vehicle giving complete weather protection, have succeeded in producing a most attractive little three-wheeler. Low upkeep and running costs are claimed for it, and, considering the power unit is only of 269 c.c. capacity and the entire weight only 280 lb., the claim may well be justified. A three-speed gear, chain transmission giving direct drive on all speeds, Zenith carburetter, independent foot and hand brakes, starting from the seat by lever, and foot acceleration are details which go to the making of a workmanlike little runabout. The matter of luggage-carrying has been well considered, the space under the emergency extra seat being ample for light parcels, while provision has been made for the carrying of such things as golf clubs, fishing rods, and tennis rackets. The whole of the mechanism and body is supported on the quarter-elliptic springs, a desirable feature for so small a machine. On the question of actual road performance the little Harper can boast of a good record in the Scottish Six Days Trials. For the makers to have entered such an arduous event with a three-wheeler fitted with so small an engine exemplified fully their faith in the machine, and their temerity was justified.

Tradesman's box-carrier models are available.

MORGAN. (139.)

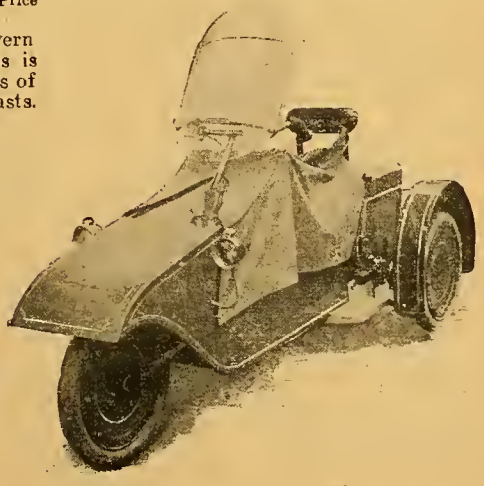
Simple Three-wheelers.

8 H.P. MODEL.—85.5×85 mm. (976 c.c.); V twin cyl. four-stroke; side valves; drip feed lubrication; Amac carb.; gear-driven mag.; 2-sp. gear; clutch and handle-starter; shaft and chain drive; 700×80 mm. tyres. Price £128.

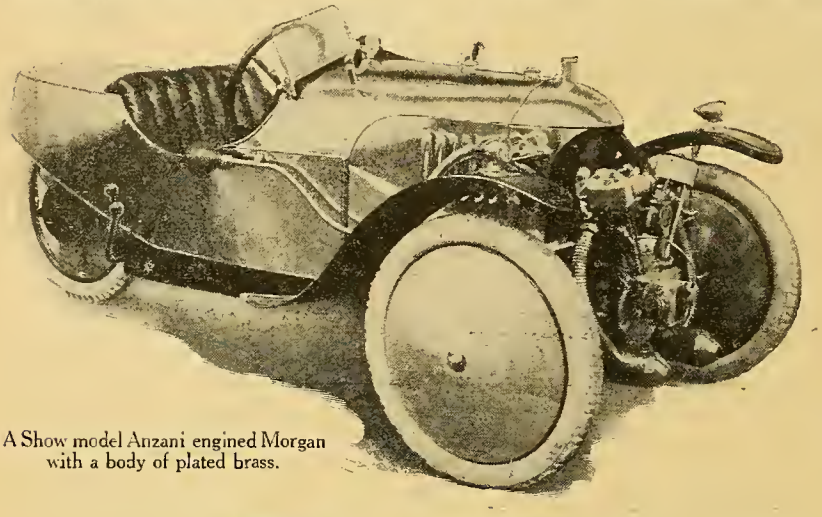
THE MORGAN MOTOR CO., Malvern Link.—The range of Morgan models is wide enough to meet the requirements of all classes of three-wheeler enthusiasts. For £128 there is offered the standard model fitted with either an air-cooled J.A.P. or Blackburne engine, whilst for £30 more the family Morgan can be had, which will accommodate two extra passengers in the rear seats. This model specially attracts the family man, for the accommodation provided is far more commodious than might be imagined on so small a chassis. Speed men can be accommodated with the Grand Prix model at the reduced price of £160, and at these figures a full equipment is, of course, included. One of the most interesting exhibits on the stand is the chassis so familiar to many and still fascinating in its admirable simplicity. No change of design is made this year, and, indeed, judging by the continued success of the Morgan, alike in the hands of private owners and in trials, little change is needed.

A model known as the Aero is another attractive exhibit, the body being polished aluminium. It draws universal attention by its various little fitments. The radiator and tank are nickel-plated, and

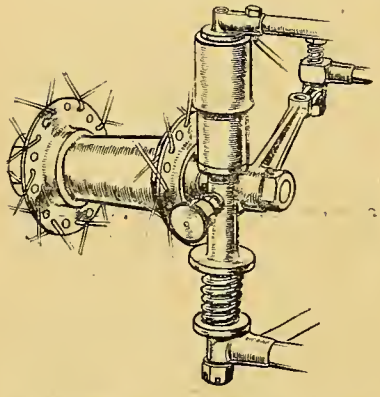
Completely equipped Harper runabout, improved in detail for next year.



Runabouts at Olympia—the general design and colour scheme are sufficiently noticeable to lure the least impressionable passer-by. The price of this model is £200.



A Show model Anzani engined Morgan with a body of plated brass.



The Morgan has no front axle in the accepted sense of the term. Steering is accomplished by pivoted stub axles.

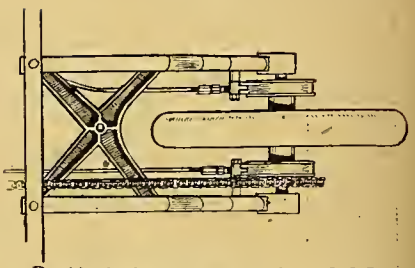
L.S.D. (169.)

Sturdy Runabouts.

8 H.P. MODEL.—85.5×85 mm. (976 c.c.); V twin cyl. four-stroke; side valves; drip feed lubrication; Amac carb.; bevel-driven mag.; 2-sp. gear and reverse; clutch and kick-starter; shaft and chain drive; 26×3in. tyres. Price £145 19s.

SYKES AND SUGDEN, LTD., Linthwaite, Huddersfield.—Sturdy construction is immediately noticeable in this three-wheeler. Its designers have succeeded in producing a machine that will stand hard wear over rough country. The main frame of the vehicle is composed of angle steel welded together and stiffened by deep oak side pieces. Detachable and interchangeable artillery wheels are used, the rear one being instantly removed by simply slackening the spring nuts. Enclosed coil springs are used for the front suspension. All the models exhibited are exceptionally attractive, but the Popular model, offered at £145 19s. (including hood, screen, horn, and complete acetylene lighting equipment), is obviously excellent value. The family man is catered for in a model which is fitted with dickey seat capable of accommodating two children, and, moreover, the makers claim 60 m.p.g. for this particular machine.

Air-cooled J.A.P. engines are fitted to all the models, the transmission being through a clutch and propeller-shaft to a gear box, and finally by chain. The L.S.D.'s records on the road prove it to be well past the experimental stage.



Double brakes on the 8 h.p. L.S.D. runabout.

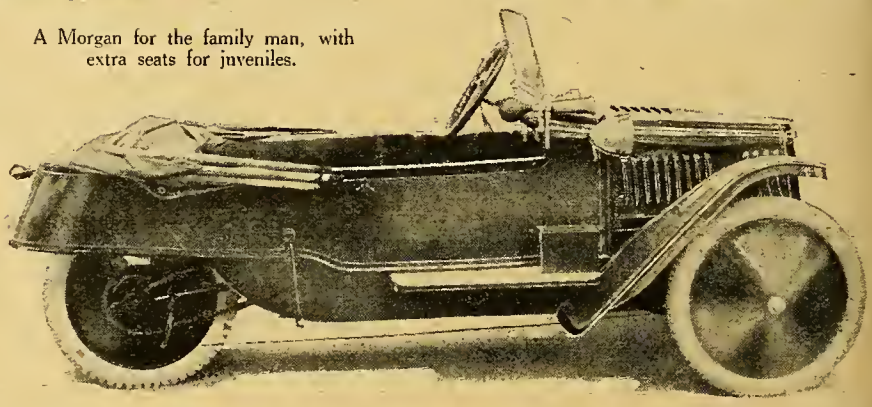
T.B. (57.)

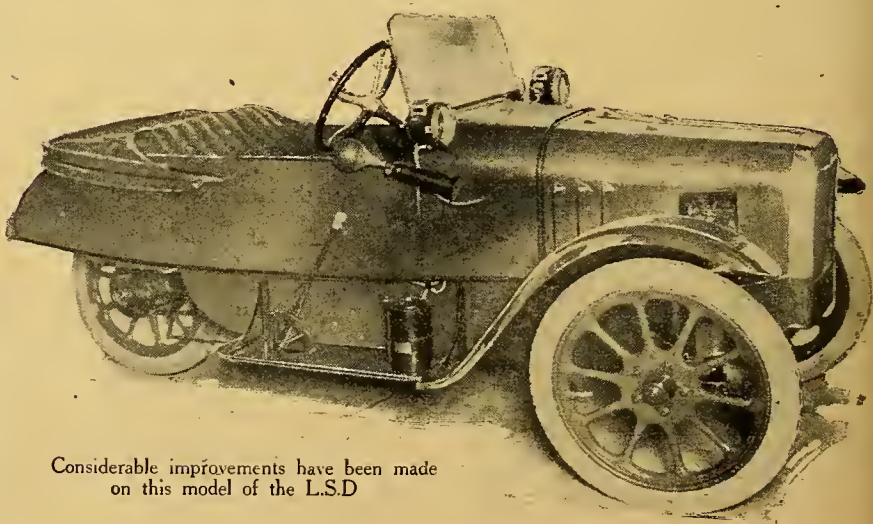
60 m.p.h. Three-Wheeler.

8 H.P. MODEL.—85.5×85 mm. (976 c.c.); V twin cyl. four-stroke; side-by-side valves; drip feed lubrication; Binks carburetter; chain-driven magneto; 3-sp. gear; clutch and hand-starter; shaft drive; 700×80 mm. tyres. Price £155.

THOMPSON BROS. (BILSTON), LTD., Bradley Eng. Works, Bilston.—The essential feature of any three-wheeler is its chassis design, this point having more bearing on the success of the vehicle than any other. In the T.B. chassis every possible weakness has been closely studied, and the result is a sound and satisfactory design. Rear springing is by semi-elliptical springs mounted on the cantilever principle, the front being of the quarter-elliptic type. All three

A Morgan for the family man, with extra seats for juveniles.





Considerable improvements have been made on this model of the L.S.D

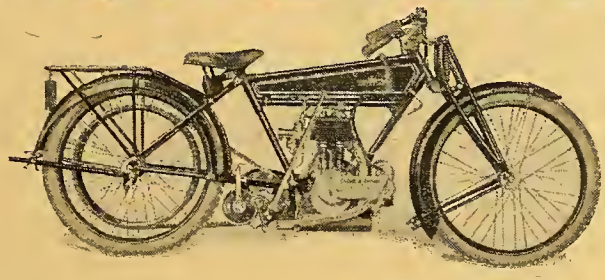
Something quite NEW-

The GNOME and RHONE

4 H.P. **4 H.P.**



At Stand 26 £69-0

PRICE COMPLETE

On view for the first time, the new 4 h.p. "G. & R."

Motor Cyclists will appreciate to the full this latest production machine of the world-famed engineers, Messrs. Gnome and Rhone.

The chief features of the "G. & R." are its **Great Strength, Perfect Simplicity,** and **Complete Reliability.**

You are cordially invited to call at Stand 26 and inspect at your leisure.

Trade and Colonial Agents are now being appointed. Buyers interested are invited to call as early during the Show as possible.

SPECIFICATION

ENGINE.—Singlecylinder4stroke,85m/m bore, 88 m/m stroke=499c.c.
GEAR BOX.—The new Gnome and Rhone 3 speed.
CARBURETTOR.—Gnome and Rhone.
IGNITION.—High Tension Magneto.
BRAKES.—(1) Main brake working on bell-rim of back wheel.
(2) Auxillary brake working on fly wheel.
TYRES.—26×2½.
FINAL DRIVE.—Chain cum belt.
FRAME.—All lugs are of drop steel forgings.

The QUADRANT

THE MARVEL OF VALUE IN THE SHOW IS THE NEW 3½ H.P. SPORTS MODEL. NOTE PARTICULARLY THE SPECIFICATION WHICH INCLUDES STURMEY 3-Speed, Kick Starter, Binks Carburetter, Dunlop Tyres, Front Hub Band Brake and powerful Foot Rear Brake, Front and Rear Stands, Aluminium Chain Covers.

60 GNS. At Works.

The 4½ H.P. Touring Combination at **£95** At Works. is also unsurpassable, and gives every comfort to passenger with Power efficiency and reliability to the driver. It is absolutely impossible to beat this specification at the price. Sturmey 3-Speed, Kick Starter, Dunlop Tyres 700×80, Oval design Tank, Binks Carburetter, Aluminium Chain Covers, Coach Built Side Car with 4 point attachment.

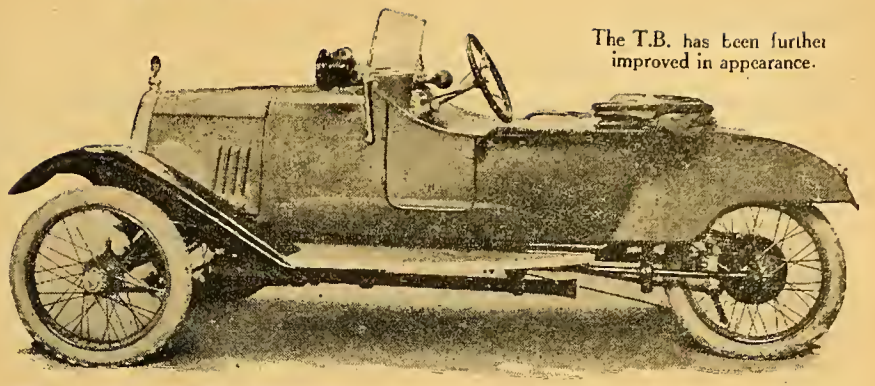
Catalogues from—

MARCH, NEWARK & CO., Ltd., QUADRANT WORKS, BIRMINGHAM.

Southern Distributors: **CLIFFORD WILSON MFG. CO., 177, Westminster Bridge Road, S.E.1**

Runabouts at Olympia.—

wheels are interchangeable, the spare wheel being carried on the off side of the body. A big improvement, too, has been effected by the introduction of a ratchet brake acting on an external contracting band instead of the internal expanding type. In general appearance the T.B. is good, and there is a cleanness and finish about all the models which, adds distinction to a pleasing range. At £155 the standard air-cooled T.B. is an attractive proposition, while for an additional £10 a water-cooled engine can be fitted, as well as several refinements in detail. T.B. three-wheelers have done remarkably well in competitions, and those who favour a sports model can obtain one with the guarantee of 60 m.p.h. Its price is £175. Family men are also catered for with a model having a type of body known in the car world as the "clover leaf"; on the T.B. this arrangement gives accommodation for a child between and slightly behind the two normal occupants.



The T.B. has been further improved in appearance.

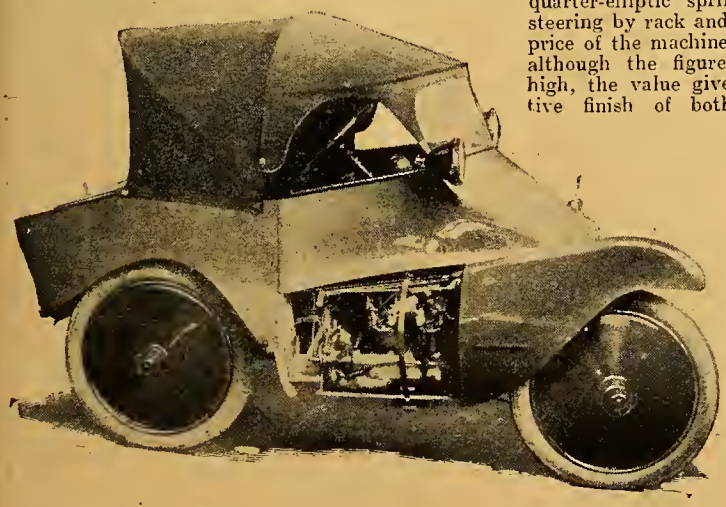
SCOTT SOCIABLE. (168.)

Unconventional but Comfortable.

5/6 H.P. MODEL.—76.2×63.5 mm. (578 c.c.); twin cyl. two-stroke; rotary inlet valve; petroil lubrication; Zenith-Scott carb.; gear-driven mag.; 3-sp. gear; clutch and hand-starter; shaft and spiral bevel drive; 700×80 mm. tyres. Price £176 8s.

SCOTT AUTOCAR CO., Lidgett Green, Bradford.—Although only placed on the market a few years ago, the Scott Sociable has already found many ardent admirers. Its unorthodox design has now become familiar amongst motor cyclists, and its price of £176 8s., including full equipment, places it in direct competition with the more luxurious sidecars. That it possesses certain advantages over the latter is indisputable, complete protection for the driver and excellent springing being two of its outstanding features. In essentials the little runabout differs but slightly from last year's models, but various detail refinements have been effected, the most important being greater ease of starting. The salient feature of the little vehicle—the triangulated chassis—has been described many times.

Years of testing have thoroughly proved the 578 c.c. water-cooled two-stroke engine to be of ample power, even on the steep hills amongst which the machine was conceived. As may be imagined, this type of engine in conjunction with the spiral bevel drive goes to the making of a machine particularly quiet and smooth in action. No doubt many newcomers to the pastime will be fascinated by the unquestioned ingenuity of this unconventional design.



One of the several Scott Sociables exhibited. The "engine room" covers are opened to show the power unit.

NEW HUDSON (142.)

A Car on Three Wheels.

10 H.P. MODEL.—82×94 mm. (996 c.c.); V twin cyl. four-stroke; overhead inlet valves; drip feed lubrication; Cox Atmos carb.; Lucas gear-driven Magdyno; 3-sp. gear and reverse; clutch shaft and final chain drive; 700×80 mm. tyres. Price £195.

NEW HUDSON, LTD., Icknield Street, Birmingham.—This finely-finished three-wheeler remains practically the same in specification as last year, with the exception of the body, which has been increased in width by 2½in., and in length by 3in. With this alteration there is now ample room for two adults and a child. A glance at the stripped chassis shows how thoroughly every point has been studied, and, incidentally, how finely finished is every detail of plant, transmission, and springing.

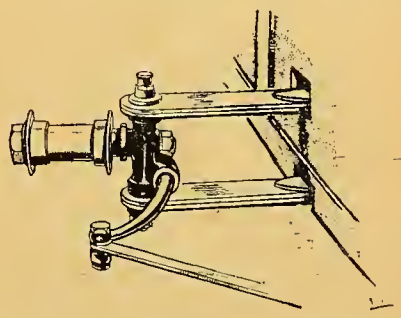
Shaft drive is employed from the water-cooled engine through a car type gear box, and then by chain to the rear wheel. All three wheels are quickly detachable and interchangeable, a jack being incorporated in the rear of the frame. The front springing is by quarter-elliptic springs, and the steering by rack and pinion. The price of the machine is £195, and although the figure may appear high, the value given in superlative finish of both mechanical parts and body work is as good as any thing in the Show.

XTRA CAR. (47.)

Single- and Double-Seater Runabouts.

3½ H.P. MODEL.—79×70 mm. (343 c.c.); single cyl. two-stroke; petroil lubrication; Binks carburetter; flywheel mag.; 2-sp. gear; clutch and lever-starter; chain and friction drive; 26×2½in. tyres. Price, £105.

XTRA CARS, LTD., 45, London Street, Chertsey, Surrey.—The Xtra Car aims at similar running costs and upkeep to the motor bicycle, and at the same time provides complete weather protection. This year the passenger as well as the solo market has been catered for, the former by the production of a two-seater model



fitted with a 976 c.c. J.A.P. engine at a price of £122 17s. A two-seater "runabout," essentially the same, uses the 343 c.c. Villiers engine. The drive is by single chain over from the engine to two friction rollers on a rocking frame. Either roller can be brought into engagement with a drum on the rear wheel. As the rollers have different-sized sprockets and themselves vary in diameter, two speeds are obtained. The rear portion of the frame is suspended on two quarter-elliptic springs, the front suspension being two pairs of transverse flat springs carrying car type steering heads. Rack and pinion steering is adopted.

The two-seater model marks the Xtra Car's entry into serious competition with the sidecar, and at the same time widens the appeal of a most interesting little vehicle. Undoubtedly the design is marked by individuality. The designer no doubt weighed the pros and cons of engine position and saw advantages in placing the engine at the rear—for it does possess advantages.

AMONG THE ACCESSORIES.

Equipment for the Motor Cyclist and Fittings for his Machine. Gallery and Annexe Exhibits Reviewed.

SO great is the number of exhibits in the accessory section of the Show that it is naturally impossible to review every stand, consequently the most practical method of dealing with the vast number of articles gathered together in the gallery and annexe is to notice chiefly those articles which appeal primarily to the private user, unavoidably omitting those which chiefly concern the manufacturer. In each case the stand number of the exhibit is shown in parenthesis.

ELECTRICAL EQUIPMENT.

A review of modern electrical equipment appeared in *The Motor Cycle* of November 16th, but naturally the announcement of many innovations was reserved for the Show.

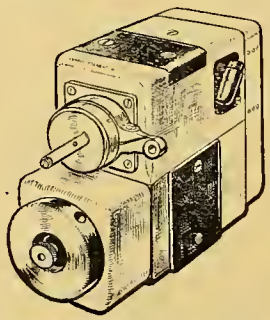
For example, The Sphinx Manufacturing Co. (202) has produced a new touring model plug which has a mica insulator protected by a porcelain cap. Perhaps its most interesting feature is the fact that the central electrode is, except for the nickel tip, of pure copper, a material which has been chosen on account of its heat conducting properties.

Progress and improvement in design are features of the C.A.V. electrical equipment (C. A. Vandervell and Co., Ltd.—233), and we were impressed by the new aluminium accumulator case which is designed to take the C.A.V.-Willard battery. There is also a neat little sidecar lamp which has a detachable front, allowing the interior to be withdrawn and used as an inspection lamp.

Neat Switches.

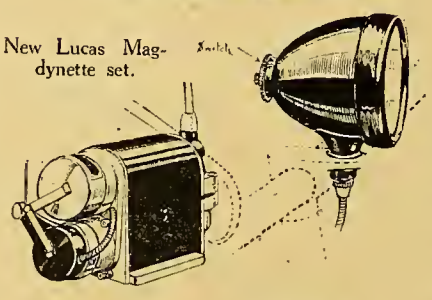
The degree of ingenuity which had to be displayed in designing the P. and H. handle-bar switch (Powell and Hanmer, Ltd.—254) for this firm's lighting installation is remarkable, for, although not more than 3in. across, this fitment comprises not only a lighting and dimming switch, but also an ammeter.

For a long time compact dynamo electrical installations for lightweights has been a crying need, and the Lucas Electrical Co., Ltd. (257), has stepped into the breach by producing the Magdynette, the generator of which is of the same shape and size as an ordinary magneto, but its special armature possesses two windings, one giving a continuous current for lighting and charging the dynamo, and the other a current for the ignition. Needless to say, the finish of the installation and its components is unsurpassed in excellence. The Magdynette is at present only suitable for lightweight single-cylinder machines, and must be driven at engine speed.

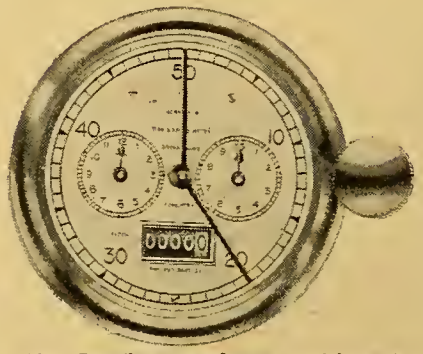


Compactness and a clean external appearance are features of the B.T.H. Mag-generator.

New Lucas Magdynette set.



Forward spring clip terminal.



New Bonniksen speedometer which totals running time and mileage.

A totally new pattern magneto has been introduced by S. North and Sons (249), which is rectangular in shape. The magnets are of cobalt steel and laminated pole shoes are employed. Naturally, it is beautifully made and is light in weight.

Among handy terminals and smaller electrical oddments must be mentioned the Saxgripp terminal (Saxessories, Ltd.—220), which springs over the screw end of the plug and remains securely fixed.

New Terminals.

The Forward snap-on terminal is also worthy of mention. It is a product of the Forward Sparking Plug Co. (293), whose weatherproof model is certainly a boon to the all-weatner rider.

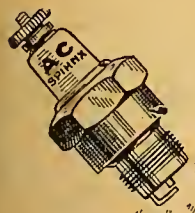
Clifford Pressland (54) also looks after the interests of the motor cyclist who does not fear the elements. His Sparxekas dome terminal not only protects the plug, but incorporates a spark gap and is an exceedingly useful accessory.

For intermittent work on comparatively short journeys, the dry battery, if a good one, gives excellent light and long service. This system of illumination has long been made a study of by A. H. Hunt, Ltd. (301). Not the least useful of this concern's accessories is the H.H. hand lamp, which is of great value as an adjunct to the motor cycle house; its battery lasts for very long periods.

Quite an excellent feature of Brown Bros., Ltd.'s (229) exhibit is a sidecar lamp attached to a bayonet jointed bracket which allows of the lamp being detached and refitted in a different position.

SADDLES AND PILLION SEATS.

It is especially refreshing to note the effort made by various manufacturers to improve the comfort for the rider. The X.L.All saddle (John Leckie and Co.—203), constructed on correct anatomical lines in one form, is provided with ball-bearing joints so that ease of movement is ensured. The same firm's combined saddle and pillion seat is a most ingenious device, as it is equally effective whether a full load is carried or not.



AC SPHINX

THE STANDARD SPARKING PLUG OF THE WORLD.

BRITISH MANUFACTURE.

Why YOU should change your Sparking Plugs to-day!

Do you know that constant use affects the good qualities of your plugs? All the zest of Sport lies in the ability to extract from your engine its last ounce of power.

That first kick-start, slow tick, and whirling race,—like the first brilliance of a new electric lamp,—gets dull and sluggish with time.

Take out your old plug, notice how the gaps have become widened and pitted, while hard brown hydrocarbon scale is coating your insulator and robbing it of its efficiency. That plug *cannot* give 100 per cent. results.

Now fit a new AC-SPHINX Plug—first making sure you have the right model for your engine—and on the instant you will notice the improved running. Lost power means greater expense of running, The cost of a new plug now and then is quickly saved on petrol bills alone.

Don't waste time and money upon experiments. AC-SPHINX Plugs are designed and produced by the largest sparking plug organisation in the World.

Get them from your local man—he holds a stock.

CEDOS MOTORS (J. McCONNELL & Co.), NORTHAMPTON

Among the Accessories.—

Particularly worthy of mention is the Tan-Sad side saddle pillion seat with handles at the side, and another model with back and foot rests on which the rider sits astride. Another very attractive production of this firm is a folding stool, which is sold at 4s. 6d., and can be carried in the sidecar and used as an extra seat or for picnic purposes. (Tan-Sad, Ltd.—242.)

Mention has already been made in these pages of the Terry spring saddle (Herbert Terry and Sons, Ltd.—252), the surface of which consists of numerous coiled springs and a top cover of leather. It gives particularly easy riding.

The Lycett Saddle and Motor Accessories Co., Ltd. (250), has adopted a similar design to the foregoing in a slightly different manner, namely, by utilising elastic rubber cords as used on aeroplane axles, and covering these with a detachable leather top. The principle of hinged coil springs and springing the saddle peak, so that the saddle has an even movement, has also been adopted. The elastic saddle should prove to be exceedingly comfortable.

Saddles Sprung at the Front.

There is a distinct tendency to spring the front of the saddle, and this method is adopted by Middlemores (Coventry), Ltd. (157), who connect the coil springs to the framework by means of three laminated springs.

Few firms have given greater study to the question of the rider's comfort than J. B. Brooks, Ltd. (310). Detail improvement has been made to the popular B.170 pattern, larger coil springs being fitted, while the action of the spring is assisted by pivoting the spring plunger rod instead of leaving it rigid. Back rests which can be fitted to any pattern Brooks' saddles are also shown. The same firm has also brought out a new pillion seat mounted on wide inverted leaf springs and with a clever system of attachment. A similar model is supplied with a back rest.

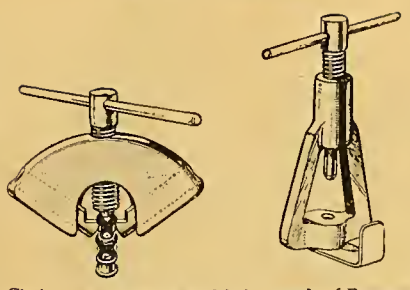
New System of Springing.

Comfortable upholstered pillion seats have been produced in numerous designs by Saxessories, Ltd. (220). In these seats springs are connected to a flexible top frame and to its under portion by flexible links. Chief among these may be mentioned the Sax-add pillion, the Sax-Orber luggage pillion, several varieties of other pillion seats, and child's seats for sidecars.

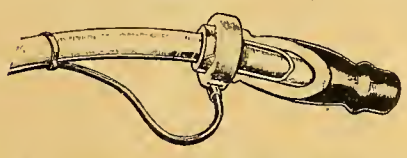
No reference to saddles would be complete without a mention of the Leatheries product (Leatheries, Ltd.—302), which should prove most comfortable, and is fitted with a back rest; while Gough and Co., Ltd.'s (279), saddle is provided with an ingenious link motion and efficient coil springing.

A new system of springing for pillion seats has been taken up by the Bowden Brake Co. (271), in which flat spring steel strips are used in lieu of cushions, a design which should give the maximum amount of comfort.

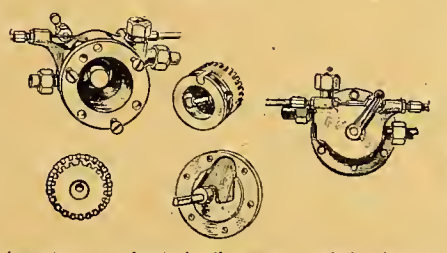
Pillion seats and saddles which are a distinct departure from the conventional are the products of A. T. Austin (118).



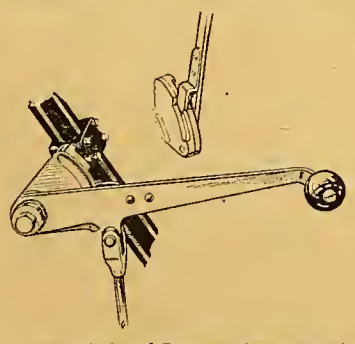
Chain rivet extractor and belt punch of Pennant manufacture.



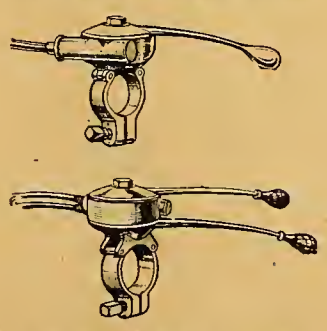
An improved form of the Pidko twist handle-bar control shown by S. Smith & Sons, Ltd.



Ingenious mechanical oil pump, called "The Pilgrim," and shown by Brown Bros., Ltd.



Neatly designed Burman change speed lever working on the gate principle.



Amac control levers can be used on the right or left-hand side opening either inwards or outwards.

The framework is of aluminium, and the seat of sheet steel anchored to the frame at one end and attached to the other by a series of coil springs. The Austin saddle weighs but 4½ lb. and the pillion seat 5 lb.

WIND SCREENS AND SHIELDS.

Protection for the passenger in the sidecar has long been the care of Easting Windscreens, Ltd. (104). The Easting screen has now reached a high state of protection, and one form has been arranged to protect both passengers in a two-seated sidecar. Nor has the driver been neglected. Easting windscreens for the solo enthusiast are now available after two appearances in the Tourist Trophy Races, but the touring model is naturally of larger dimensions than the I.O.M. type, and gives further protection owing to the addition of an apron.

The question of protection for the sidecar passenger has recently been the careful study of Auster, Ltd. (274). The screens for motor cars have long been world-famed. One of the most ingenious sidecar screens we have yet seen is the Auster, which can also be used as a sidecar cover. When out of use, the screen portion lies flat with the rest of the cover and is attached thereto by means of the effective lightning fastener.

Weather protection for the driver of either a motor bicycle or a sidecar outfit has also been the care of the T.O.M. Syndicate (51). Complete protection is given by the T.O.M. shield, and also incorporated is a wind deflector which directs a forced draught on to the engine. The tiny face screen and ample-sized apron can be folded back when the machine is at rest, thus completely covering the saddle and the top of the machine.

ANTI-THEFT DEVICES.

There are several ingenious devices for the purpose of defying the motor cycle thief. Among these may be mentioned the Lee lock (Lee Locks, Ltd.—52), of which there are two models, one for existing machines, and the other built up in the head tube of the frame. It is absolutely safe, and the key, of which each series is different, cannot be withdrawn unless the lock is secure in either the free or lock position.

Quite a different principle is employed in the Firmus carburetter control lever and lock, which, as its name implies, is a carburetter control lever set which incorporates a letter lock. This is shown by the Firmus Co., Ltd. (49).

GENERAL ACCESSORIES.

Under this heading come such things as horns, clocks, watches, and other unclassified items. These accessories are handled by many of the previously-mentioned firms. In addition to these may be named several good examples of horns by Dckla, Ltd. (117), and Clayton-Wright, Ltd (222).

Acetylene lighting installations were pretty thoroughly dealt with in the issue of November 16th, but it should be recorded that Allen Liversidge (240) has introduced a new and neat push-on gauge for the latest pattern D.A. lighting set, while Dunhills (253) supply a nicely-made and inexpensive cast aluminium generator.

Among the Accessories.—

and Timson Bros. (201) show a complete range of F.R.S. lamps. Obviating the necessity to clean the carbide container of the generator, the Elephant Chemical Co.'s carbide carrier is a very useful invention, which allows the carbide to be inserted in any standard lamp in cartridge form.

For converting a hand- into a foot-pump, the Ellcam Cycle and Motor Co. (208) supply a very neat fitting adaptable to any cycle pump.

An excellent example of a collapsible sidecar hood is to be seen on the stand of the Apex Inflator Co. (149).

Silencers were not greatly in evidence in our tour of the gallery, but, on the ground floor, the Sirrah silencer (Alfred Wiseman—164) is an excellent fitting. It is of cast aluminium, has a perforated end, and contains an aluminium plate, on each side of which are staggered diagonal baffles. A $\frac{1}{16}$in. clearance is left between the edges of this and the outer casing to allow of enough leakage to prevent back pressure.

Best known for valve attachments, which not only enclose the valve springs, but eliminate air leaks, the F.E.W. Patents Co. (151) has introduced an aluminium radiator, which can be fitted to any hollow valve cap in a very short space of time.

OILS AND ENAMELS.

Lubricating oil firms at the Show are The British Oil and Turpentine Co., Ltd. (248), The Challenge Oil Co., Ltd. (245), The County Chemical Co., Ltd. (286), Prices Co., Ltd. (191), Sterns, Ltd. (118), The Vacuum Oil Co., Ltd. (232), and C. C. Wakefield and Co., Ltd. (223).

Enamels are shown by Jenson and Nicholson, Ltd. (Robbialac), and the Judge Brand Co., Ltd.

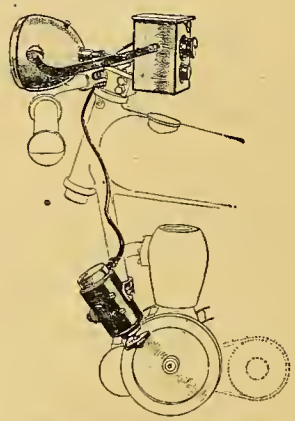
SPEEDOMETERS.

A study of the various types of speedometers in the Show is a particularly interesting one. Shown for the first time, the Bonniksen time and speed meter is an exceedingly attractive instrument. In the centre of the dial are two smaller dials. One for showing the time has a clock movement starting from the moment the machine is put in motion, while the other dial records the distance. By dividing the figures shown on one dial into the other, the average speed is obtained, or a calculator is supplied which allows the record to be ascertained at once. This is to be seen on Rotherham and Sons' stand (251).

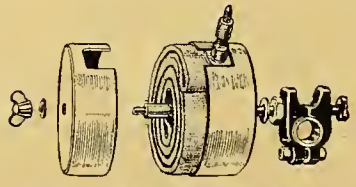
Two of the speedometers in Olympia work on the fan principle, in which the flexible shaft drives a fan which generates a current of air conducted on to a second fan attached to the indicating needle. Two excellent examples of this are the J.W.T., shown by Hobday Bros. (239), and the Imspecs, shown by G. Davenport and Co., Ltd. (276).

Among the centrifugally-actuated instruments is the Watford (S. North and Sons, Ltd.—249), which is one of the best-known English makes, and has a world-wide reputation for steady reading and reliability.

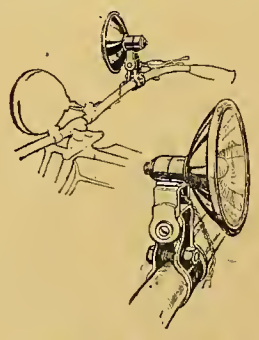
Small D.A. lighting set, with 4-5 cubic feet cylinder.



Flywheel driven Britalite dynamo lighting set with handle-bar mounted accumulator



Neat, safe and effective inner tube carrier made by Clayton-Wright Ltd.



Invaluable for use in fog or for reading signposts, the Stewart handle-bar spot light.

Also working on the same principle, but not of British manufacture, are the Stewart (The Cooper-Stewart Eng. Co., Ltd.—283) and the Johns-Manville (Markt and Co., Ltd.—300). The latter firm is also demonstrating a gear-driven Veeder cyclometer, an inexpensive fitment which records distance only, and not speed.

Though no alteration has been made in the ingenious Cowey speedometer movement (Cowey Eng. Co., Ltd.—298), it must be mentioned that one of the firm's latest models can be supplied without the trip arrangement at a considerably reduced figure, while the more elaborate model with trip record has been improved in design and can be fitted with an efficient lamp to illuminate the dial.

SMALL TOOLS AND EQUIPMENTS.

Articles which strongly appeal to the practical motor cyclist are small tools, including not only those which can be carried on the machine, but which also can be used for purposes of repairs and adjustments in the motor cycle house.

Special mention must be made of the spanners, adjustable and fixed, which are the production of the Pennant Manufacturing Co., Ltd. (190). The 6in. screwdriver, provided with an aluminium handle and machined $\frac{5}{16}$in. square steel hardened blade, is a particularly fine tool which will stand any amount of abuse. There is also an excellent chain rivet extractor which will take several sizes of chains, an equally good belt punch, and an all-steel adjustable spanner.

It is often a difficult matter to replace a valve spring in position. The orthodox method with a very powerful spring is to tie up each side of the spring with string, but the compression thereof is usually a difficulty. The special tool provided for this purpose by Ernest H. Hill, Ltd. (194) allows this operation to be carried out without difficulty.

For the Garage.

Though more or less a garage tool, the utility of the ball-bearing extractor which is the product of J. A. Ryley (234) cannot be denied. By means of this tool a ball bearing may be extracted from a crank case or gear box in a few seconds without the slightest risk of damage.

A beautifully-made spanner, known as the Boss, which can be made to grip a nut like a vice, is sold by Saxessories, Ltd. (220). The jaws are moved by means of a knurled screw forming part of the handle, which moves on a very slow thread. Special mention must also be made of several patterns of chain rivet extractors which are products of the same firm.

Excellent examples of small tools are to be found on the stand of Brown Bros., Ltd. (229), and of Dunhills, Ltd. (253).

Practical sets of motor cycle spanners are specialities of F. Line and Co. (198), and note should be made of the useful box spanners made by Accles and Pollock, Ltd. (196).

Proprietary Engines are illustrated and described on pages 811 to 813, and a Tyre Buyers' Guide will be found on pages 804 and 805.

MOGARD THIEF PROOF PETROL TAP

Effectively Fools the Motor Cycle Thief

He can't turn on the petrol. Only the correct combination of the three tap screws—known only to the owner—gives a free supply of petrol. The slightest turn of any one screw effectively closes the tap. Get a Mogard Thief Proof Petrol Tap to-day and save yourself the worry, the anxiety and financial loss of a stolen motor cycle.

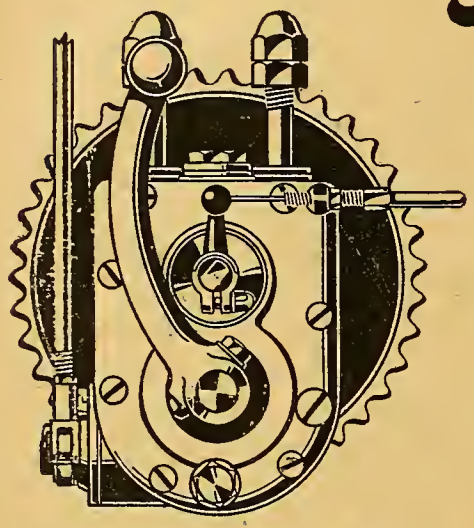
MOSS

The Secret of Silence



The new 1923 Moss Three-speed Gear for Motor Cycles up to 500 c.c. *is the most silent box on the market*, and the *secret* of this noiseless running *lies entirely in the design.*

In the first place, THE GEARS NEVER MOVE ENDWAYS—they are FIXED in position on their respective shafts and EVERY CHANGE IS CARRIED OUT ENTIRELY BY DOGS. This feature definitely eliminates worn splines and consequent running out of pitch.

That is the whole secret, and the sound engineering lines upon which the design proceeds, guarantees silence not for the first 500 miles only, *but through out the life of the motor cycle to which this gear may be fitted.*

COME TO OUR STAND and study the models on view. Let us tell you more about this unique gear box so that you may better realise that once again MOSS GEARS are far ahead of competition.

Illustration with part of the felt and Rexine cover cut away to show construction of saddle.

You will see the wonderful floating

"TERRY"

spring seat saddle.

We invite you to come and see it, sit on it, test it, and discover its real good qualities—so you may have it on your 1923 model.

If you cannot visit the Show, write now for literature describing the saddle and its successes —post free.

Herbert Terry & Sons, Ltd.,
Manufacturers,
Redditch, Eng
Est. 1855

228 miles one day!

Capetown.

I must write and tell you how I have appreciated your spring saddle; after six months riding I have never had to adjust it once.

Last month I was third in the Cape Motor Marathon Race of 202 miles in the sidecar class on an 8 H.P. 'Enfield" and sidecar fitted with a Terry's Saddle. Also did the fastest time, 5 hours 27 minutes 10 seconds, although having to stop four times to replenish my oil and petrol and tighten the handlebars. The road in parts was very bad indeed, miles of potholes, at times the combination left the ground entirely. Stretches of sand, two streams and one river to cross. I rode thirteen miles to the start and thirteen at the finish, making my total mileage 228 for the day. The saddle was as comfortable at the finish as it was at the start, and made all the difference.

You can make any use you like of this letter from a satisfied owner.

N. F.

Stop!!! We've got the machine you want

and not only have we this—the first essential—but we have something just as important to all careful motor cyclists.

And that is—**SERVICE AFTER SALE.**

In the old days, when you bought a machine, the Service you obtained was pretty much a matter of luck.

That was before Allen-Bennett had discovered the real meaning of the word Service. Now you need only get in touch with an Allen Bennett man and you get real Service right from the start—year in and year out.

Our name is your unfailing assurance of a perfect machine of proved merit, the easiest of easy terms extending over a period of eighteen months if you so desire, and every attention to your personal wishes.

Remember, also, that owing to our very favourable position as contracting agents we can give PROMPT DELIVERY.

When you visit the Show, look for the Allen-Bennett representatives on these stands:

MORGAN	**BROUGH SUPERIOR**
MATCHLESS	**SHEFFIELD-HENDERSON**
DUNELT	**P. & P. SILENT THREE**

or any other stand by appointment.

If you are unable to visit the Show, write us for full particulars of our new and second-hand and shop-soiled machines—it will also serve as an introduction to Allen-Bennett Service

We are contracting agents for all leading makes of machines. Sole district agents for London and 30 miles radius for

BROUGH SUPERIOR
SHEFFIELD-HENDERSON
P. & P. SILENT THREE

Over 100 shop-soiled and second-hand machines in stock. Why not call and see whether any of these meet your requirements.

Once again we reiterate:

"Stop! We've got the machine YOU want!"

Commercial Publicity.

In answering this advertisement it is desirable to mention "The Motor Cycle."

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words 3/–, and 3d. for every additional word. Paragraphs of under 8 words are charged double rate. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable to ILIFFE & SONS Ltd., and crossed & Co. Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance and be addressed to the offices of "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle." by the first post on Friday morning previous to the day of issue. Advertisements that arrive too late for a particular issue or that are crowded out will automatically be inserted in the following issue unless accompanied by instructions to the contrary.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "The Motor Cycle," Dorset House Tudor Street, London, E.C.4. *Readers who reply to Box No advertisements are warned against sending remittance through the post except in registered envelopes; in all such cases the use of the Deposit System is recommended, and the envelope should be clearly marked "Deposit Department."*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisement some mention of the district in which the machine offered may be seen and tried.

☞ DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor. Carriage is to be paid by the buyer, but in the event of no sale each party pays carriage one way. The seller takes the risk of damage in transit. For all transactions up to £10 a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, 1%. All deposit matters are dealt with at Dorset House, Tudor Street London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one [illegible]

THE CREAM OF THE SHOW AT LOVETT'S

All the best Motor-cycles exhibited at Olympia are obtainable at Lovett's, as we have secured Agencies for the 1923 season embracing the machines that are most sought after.

As has been the case for so many years past, Lovett's have again placed themselves in a position to meet the requirements of every customer and ensure his satisfaction.

In the showrooms at both our Depots there is an unrivalled display of new motor-cycles and a selection of second-hand machines that includes all types.

Lovett's aim at suiting the convenience of all their clients.

If you have a machine you must dispose of before purchasing your new motor-cycle or light car, Lovett's will allow you a fair price for it in part exchange.

If you wish to extend settlement over a period, Lovett's offer you the assistance of their "Divided Payment Scheme," which confines the transaction to you and them and so ensures privacy.

Finally, Lovett's "After Service" in connection with both new and second-hand machines is an advantage you would be unwise to miss.

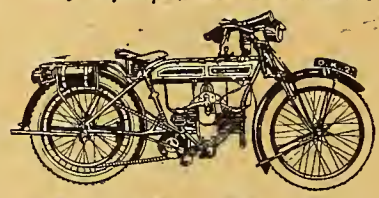
BURLINGTON DOUGLAS

Fully Equipped and Guaranteed.



FREE

Great New 'Burlington' Competition.

TO further popularise our well-known Sidecars, we have instituted the following interesting competition, in order to obtain a really good slogan for these Sidecars.

NOTE.—The type of slogan required is something similar to "Luxury Products at Economy Prices," or "Best on the Long Run."

All that is necessary is to send in your suggestion for a slogan, accompanied by an order for goods to the value of not less than 2/6.

Every 2/6 entitles you to send a suggestion.

THE CLOSING DATE DRAWS NEAR.

SEND YOUR SUGGESTIONS NOW.

An abbreviated List of spares and useful accessories will be found under our advertisement in the Miscellaneous columns

AT THE SHOW—

Don't hesitate—ask for the Burlington representative. Our representatives will be pleased to meet you on any stand by appointment and to advise you on any point relating to motor cycles.
We can supply any machine for cash or deferred payments.

MOTOR CYCLE SUIT

With Plaited Leather Belt.

GUARANTEED WATERPROOF

SPECIFICATION

MADE from hard-wearing double texture fawn material with an interlining of Rubber. Double Breasted Jacket, with all-round Belt and Leather Buckle, large Patch Pockets, and converted collar to button right up to neck, to fasten with Throat Tab. Wind Cuffs in sleeves. All seams of the Suit are rubber cemented and taped with extra material, making the garment absolutely waterproof.

Overall Trousers with spat-shaped leg; wind gussets to keep the wind from the leg and boots; fastened with patent clasp fasteners, enabling the trousers to be pulled off in a moment. The suits are newly manufactured, and every care is taken with details so that the garment will meet the severest test. We give full guarantee that this suit is thoroughly waterproof and impervious to the most drenching & continuous downpour.

THESE SUITS ARE NEWLY MADE FROM FRESHLY PROOFED MATERIAL BY EXPERIENCED WORKMEN, AND NOT HALF PERISHED CLEARANCE LINES OR W.D. SURPLUS.

PRICE **35/-**

NO EXTRA CHARGE FOR CARRIAGE.

State chest measurement and height when ordering.

50 BRAND new lightweight and heavyweight sidecars, complete with tyre; £7/7.—Headley Manufacturing Co., Cumbernauld, Glasgow. [2736

MIDDLETON'S Spring Wheel Sidecar again wins Championship at Brooklands, making third successive year. Le Vack (Zenith-Jap) first, O. de Lissa (Motosacoche) second.

MIDDLETON'S Spring Wheel Sidecar again used for records, 50 miles, 100 miles, one hour, by Messrs. Temple and Allchin, on the famous Harley-Davidson

MIDDLETON'S Spring Wheel Sidecar was used by the winners in the 200-mile race, Messrs. Davidson (Indian) and Le Vack (Zenith).

MIDDLETONS Supply on extended payments if so desired.

MIDDLETONS cater for New Poor and New Rich alike. Our sympathies are, however, with the former. We know how it feels, never having been anything else, for, as you are probably aware, we make nothing out of sidecars, just doing it, like the artists' model, for a bare living.

MIDDLETONS, London's Oldest-established Sidecar Makers. Business hours, 9 to 6; Saturdays, close 12. Sundays, like the Scotsmen, we stop in bed for economy. Saves wearing out boots, you don't need a fire, and it keeps the appetite down.—27, Stroud Green Rd., Finsbury Park. 'Phone: Hornsey 1584. [0522

SIDECAR ATTACHMENTS.

COUPETTE Sidecar, listed at £32, must sell; £20, —4, Berkeley Mews, Connaught St., Marble Arch, London. 'Phone: Paddington 1177. [3173

RELIANCE Magneto Repairing Co.

RELIANCE for Repairs, new magnetos, and spare parts of every description.

RELIANCE have the largest and most up-to-date repair factory in London or Provinces.

RELIANCE carry out all repairs on the premises, including armature winding. Trade inquiries solicited.

RELIANCE have one of the most modern armature-winding plants and test rooms in the country, and can therefore offer you the following advantages:—

TIME.—All work within 6 to 48 hours, and a solid 12 months' guarantee in writing to back it up.

CHARGES.—No flat rates. You are charged according to the work that is required; therefore you are not in some cases helping to pay for other people's repairs.

OUR Offer.—We shall be pleased to allow you to see your magneto on test after repair at our works. How many others can make the same offer?

RELIANCE have the following magnetos in stock, all fully guaranteed and on approval.

THOMSON-BENNETT.—Singles and twins, new, any degree, waterproof, variable, suit any engine; price 55/-.

C.A.V. Singles and Twins, new, ideal for any lightweight, 2¼h.p. and 4h.p. Douglas; 55/-.

BOSCH, Type Z.A.2, second-hand, enclosed, waterproof, variable, latest pattern, for Douglas 2¾h.p. and 4 h.p.; £4/10.

ACCUMULATORS, best makes only, for all purposes, any voltage, charged and uncharged, always in stock; send for prices.

BOSCH Enclosed, waterproof, type D.A.L. magnetos, Government surplus, any degree, ready to fit on Indian, Harley, J.A.P., or any big single or twin. We guarantee these to give you slow running and easy starting, and they are in every way ideal for the big machine; price, carriage paid, £4/10.

GUARANTEE.—Every magneto, no matter what the price or make, is guaranteed by us. Not merely that same is in good order at time of sale, but a plainly written statement that we guarantee each machine against all defects for a period of 12 months. This, we maintain, justifies us in charging a few shillings more than certain of our competitors. List sent post free upon application.

RELIANCE were established in 1914, since when we have enjoyed a reputation which is second to none for straight and fair dealing.

AMAZING Offer.

COUNTY of London Engineering Works, Ltd.

WE hold the largest and most varied stocks of magnetos and spare parts in England, our stocks comprise of over 30,000 magnetos, and an inside estimate of our spares is £250,000.

WE would bring to your notice that these magnetos are not old disused magnetos painted on the outside to look like new, like many being offered to the public by so-called magneto specialists and experts, but are new unused Government surplus, and every magneto previous to being sold is thoroughly overhauled, and subjected to the same test as by the makers.

GUARANTEE.—These magnetos are all fully guaranteed for 12 months against all defects, and should any magneto at any time within this period prove in any way defective, we will willingly exchange or repair same free of all charge.

APPROVAL.—Notice all goods sent on approval for 14 days, per return of post on receipt of cash, and in the unlikely event of these goods not meeting with your entire approval, we will willingly refund cash in full, making no deductions for packing or carriage. Magnetos despatched through this paper's deposit system if required.

B.O All letters relating to advertisements should quote the number at the end of each advertisement, and the date of the issue

IGNITION, LIGHTING, ETC.

MAGDYNAMO Engineering Co., Ltd., for magnetos, spares and repairs.

MOTOR Cyclists fit reliable high quality magnetos now and avoid certain failure of inferior magnetos.

BOSCH Enclosed Waterproof Type D.A.L. Magnetos, Government surplus, ready to fit on Indian, Harley, J.A.P., or any big single or twin, gives powerful spark at all engine speeds, makes your engine a real live engine, give you easy starting, smooth and rapid acceleration, high speed, and low fuel and oil consumption with increased power; price only £5 each, postage 1/6 extra; a 12 months' written guarantee sent out with each magneto. We give you satisfaction or refund cash.

PLEASE note the above type magnetos were originally manufactured for 200h.p. aircraft engines; therefore we have every confidence in claiming them to be the magneto you require for your big machine. Fit one to-day, and see life with a live machine.

HARLEY-DAVIDSON Owner writes: "Magneto to hand; many thanks for prompt despatch, satisfactory in every way; will recommend to my friends."

ZENITH Owner writes: "Since fitting magneto have completed a run of 250 miles; highly satisfied; will certainly recommend these magnetos."

INDIAN Machine Owners.—Your high-class machine deserves a high-class magneto. We want 1,000 Dixie 42° magnetos; send your magneto and £4 now, and we will immediately despatch you a Bosch D.A.L.

READY to fit on your machine; there are no alterations to make.

WHY is it that the leading Motor Cyclists—the men who know—are almost all sending to us for their Magnetos?

THERE must be a reason; there is; it is because the Magnetos of quality and guaranteed service, supplied by Magdynamo, beat all other Magnetos.

MAGDYNAMO will take your old Magneto in part payment.

REMEMBER your magneto is sent on 14 days' approval against cash per return on receipt of your order; there is no obligation to keep it until you have used it for 14 days on your machine and are satisfied; let us send you one now.

ARE You a Discerning Douglas Owner? Do you want a reliable magneto with 12 months' guaranteed service that will give you starting without worry, a smoother running, and more powerful engine and better results from your Douglas? Then send for a latest enclosed waterproof type Bosch XA2 magneto now; price only £5, carriage 1/6.

C.A.V. Magnetos (not converted starters), ready to fit on Triumphs, B.S.A.'s, Nortons, and P. and M.'s, with 12 months' guaranteed service, price £3/10, carriage 1/6.

THOMSON-BENNETT Magnetos latest enclosed waterproof type (not converted starters), ready to fit on 55° Clynos and 180° Douglas machines, with 12 months' guaranteed service, price £3/10, carriage 1/6.

MOTOR Cycle and Car Owners, are you testing all your sparking plugs properly? Are you wasting pounds yearly by throwing away good plugs? Fit a Bosch aeroplane hand starter magneto on your garage bench to-day and always have your sparking plug tester at hand, price £2, carriage 1/6.

TRADE discounts and export quotations.—Write, call, or 'phone for terms.

A YEAR'S guarantee on repairs. Before you scrap that magneto, whatever its condition, let us see it; we will rebuild your magneto to look and work like new, no matter what make, within 3 days or 24 hours if urgent, and return it with a written 12 months' guarantee. While your magneto is being repaired we can lend you another free of charge. We could not make these offers if we were not certain of the quality of our work.

YOUR old magneto will be equivalent to new at a low cost. Send us your defective magneto now.

EXPRESS Dixie Repair Service. Your Dixie magneto, no matter what size, rebuilt equal to new and returned in 12 hours, at 30/-; a small extra charge for necessary replacements.

C.A.V. Express Repair Department.—Your C.A.V. magneto, no matter what type, rebuilt equal to new and guaranteed for one year, returned in 12 hours, at 30/-; a small extra charge for necessary replacements.

THE PLUG WHICH NEVER OVERHEATS

Incandescent plug electrodes are a common cause of pre-ignition. This fault is completely overcome in the **new Forward type "B" Plug** which has a centre electrode of pure nickel no less than 3/16" diameter running **right through the plug.**

Do not fail to inspect this new plug together with the other Forward Accessories at OLYMPIA, 5TAND No. 293, Gallery.

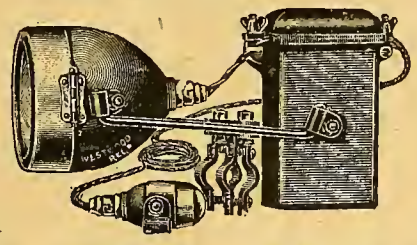
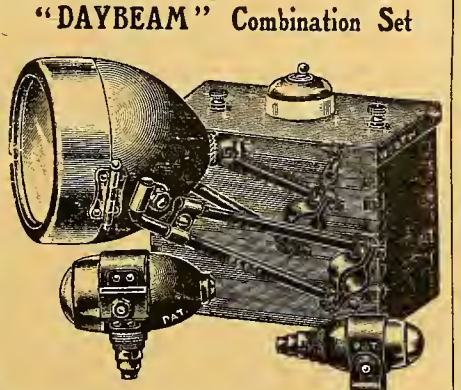
"DAYBEAM" Electric Solo Set



The Headlamp supplied with this set is our 5in. Daybeam, a very powerful light-giver. The brackets are of exceptionally strong and handsome design. They carry the headlamp and also the (die cast) aluminium case. The accumulator is specially made for motor cycle lighting, and will brilliantly illuminate the head and the rear lamp for 20 hours if used intermittently. The tail lamp (our torpedo S.B.C.) is exceptionally strong and well made, and has a very attractive appearance. Each lamp is fitted with a switch, and one lamp may be used independently of the other. The outfit is despatched completely assembled, and 4 volt bulbs are fitted. The finish is ebony black and nickel plate.

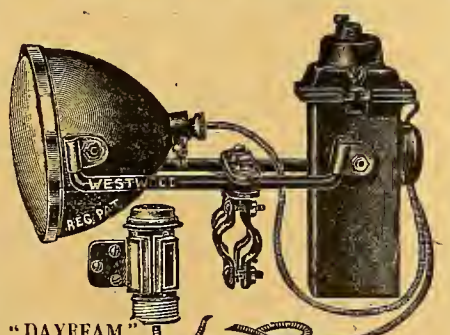
Complete Outfit, List No. 30/1, Price £5 5 0

"DAYBEAM" Combination Set



The set comprises Daybeam 7in. Headlamp, Ideal Sidecar Lamp, and Torpedo S.B.C. Tail Lamp. Each lamp is fitted with an independent switch, and is finished in ebony black with nickel-plated relief. The accumulator (capacity, 6 volt, 40 amp.) is specially made for motor cycle lighting, and will give very satisfactory service in use.

Complete Outfits, List No. 30/2, Price £7 7 0



"DAYBEAM" Complete Electric Set for Lightweights

EXCHANGE Countershaft Triumph Combination for lightweight.—239, Goldhawk Rd., Shepherd's Bush. [2886

3½h.p. Triumph, modernised, fast, reliable, all on; £20; exchange.—132, Silvermere Rd., S.E.6. [2868

EXCHANGE your present machine for a new car or motor cycle at Keys, 8 and 10, Bond St., Ealing. [9448

EXCHANGE Rudge-Multi, late model, and £10 for higher power twin.—Kennard, 78, Yerbury Rd., Holloway. [2796

CALTHORPE 2¼h.p., 2-speed, for higher power 2-speed, or sell £25.—46, Gladstone St., Longton, Staffs. [2698

1921 Triumph, 4h.p.; exchange lightweight, cash according date.—"Doriwyn," Cambridge Rd., Eastbourne. [2988

GRAMOPHONE, massive Louvre cabinet grand, 40 guinea model, for motor cycle.—Tovey, 76, Cromwell Rd., Luton. [2757

A.J.S. Combination, luxurious outfit, dynamo, hood, screen, spare wheel, £105, for 3-wheeler.—89, East Hill, Wandsworth. [2970

1922 Coventry Premier 4-wheeler, as new, for something cheaper and cash.—151, Amyand Park Rd., Twickenham. [3395

£10 and 3½h.p. B.S.A. with Watsonian sporting sidecar, good condition, for big twin; sell £25.—Peters, Itchenor, Chichester. [2683

WANTED, 3-wheeler in exchange 1921 Bleriot-Whippet, dynamo; sell £85.—10, St. Brides Rd., Egremont, Wallasey. [3047

EXCHANGE 10h.p. 2-seater car, electric lights, for motor cycle or combination and little cash.—The Fire, Kearsney, Dover. [2752

F.O.C.H., the exchange specialists; best prices allowed; easy payments arranged.—5, Heath St., Hampstead (near Tube). [3863

SCOTT Standard Sidecar Wanted; exchange gent's Raleigh 3-speed cycle, practically new.—42, Marine Terrace, Margate. [2964

1-TON Lorry, pneumatics, running, for P. and M. or Douglas combination; cash adjustment.—4, Auckland Rd., Doncaster. [3034

NEARLY new Henderson dynamo solo, exceptionally fast, consider cheaper machine and cash.—9, Red Hill, Bassett, Southampton. [2958

SOUTHPORT.—See A.J.S., A.B.C., B.S.A., Norton, Rudge, and Scott columns.—Kents, 417, Lord St., Southport. 'Phone: 1273. [3064

2¾h.p. Douglas Gear Box, perfect condition, for 1917 Harley-Davidson tanks.—3, Prospect Place, Combe Down, Bath. [3101

EXCHANGE.

EXCHANGE Posh 1920-21 Clyno Lightweight and cash for higher power or combination.—27, Cornnne Rd., Tufnell Park. [3393

EXCHANGE Ivy 2-stroke, 2½h.p., and cash for higher power solo or combination.—239, Winchester Rd., Highams Park. [3097

HALIFAX.—50 second-hand combinations; keen exchanges; deferred payments taken.—Halifax Motor Exchange, Horton St., Halifax. [2845

BLACKBURNE 4h.p., 1920, fully equipped, as new; exchange lightweight and cash; sell cheap.—143, Ravensbury Rd., Earlsfield, S.W. [3313

1922 Ivy Three, all-chain, Moss 3-speed, clutch, kick-start, and little cash, for late combination.—172, Rushby Mead, Letchworth, Herts. [2804

EXCHANGE 11h.p. 2-seater car, in perfect condition, for combination, or sell £75.—85, St. Stephen's Rd., Sneiton, Nottingham. [2995

SINGER 1920 2-seater, lighting and starting; £165; part exchange Morgan or combination.—J.S., 8, Conrthope Rd., Hampstead, N.W.3. [3037

15h.p. Humber Touring Car, 4-cyl., gate change, running order; £30, or exchange.—Ward, South Western Garage, New Malden. [3363

ITALA Ton Van, 24h.p., 4-cyl., 4 speeds, detachable rims, any trial; exchange; sell £40.—Ward, South Western Garage, New Malden, Surrey. [2555

COVENTRY PREMIER 1921, dynamo lighting, spare wheel, as new, exchange solo or combination and cash.—51, Upper Richmond Rd., Putney. [3385

DAIMLER Landaulet, splendid order, would accept motor cycle and cash.—Lieut. S., 12, Greville Place, Kilburn. 'Phone: Maida Vale 1819. [2673

SPRING Frame Ruby 3h.p., 1921, A1 condition, for a modern machine suitable for sidecar, or sell; £44.—8, Cornwall Mews South, S.W.7. [3022

EXCHANGE 1920-21 Triumph Combination, practically new, for lightweight and cash.—37, Arlington Rd., Surbiton. 'Phone: Kingston 1274. [3029

EXCHANGE 1917 6h.p. Campion-Jap Outfit, beautiful condition, equipped, tax paid, for something smaller and cash.—103, Moore Pk. Rd., Fulham. [3017

EXCHANGE Morgan, Grand Prix, registered as 1918, J.A.P., dynamo, speedometer, for 1921 Triumph combination.—Dennis, 5, Hitchin Rd., Shefford, Beds. [2835

MORGAN 1920, M.A.G., electrics, hood, screen, good tyres; exchange high-powered combination and cash; evenings.—53, Patshull Rd., Kentish Town. [3393

MORGAN, Grand Prix, 1921-2, M.A.G., dynamo lighting, aluminium dash, unscratched; exchange offers and cash.—7, Cowdrey Rd., Wimbledon. [3207

1922½ 8-10h.p. Royal Ruby Combination, as new, Lucas Magdyno, every gadget; exchanges; see Royal Ruby coluumn.—Ewers, Newton Rd., Burton-on-Trent. [3032

CHATER-J.A.P. Combination 8h.p., all chain, electric, Baks, Dunlops, Magnuma, sprung sidecar wheel, exchange Henderson solo; sale £60.—46, Cranbury Rd., Eastleigh. [2782

EXCHANGE Alldays-Allon 2½h.p., good condition, with cash, for countershaft Triumph or similar, or one needing repairs.—R. Davies, King Coed, nr. Usk, Mon. [2826

A.C. 1921 2-seater, dickey, perfect, as new, all on, exchange A.J.S. combinations, Morgans, cash adjustments, sell cheap.—Carter, Jeweller, 15, Fishergate Hill, Preston. [2678

HUMBER 3½h.p., 2-speed, lamps, horn, not taxed, good running order; £18; exchange with cash for modern motor cycle, combination, or car.—Kearsney Garage, Dover. [2751

TRIUMPH, brand new, all-chain combination, for Norton or similar and cash.—4, Berkeley Mews, Connaught St., Marble Arch, London. 'Phone; Paddington 1177. [3169

EXCHANGE brand new 1923 Rover 8h.p. for second-hand motor cycle or car and cash.—Wilkins Simpson, opposite Olympia, London. Tel.: Hammersmith 238. [2793

10h.p. Darracq 2-seater, dickey, 4-cyl., gate change, low, fast, smart, good puller; exchange combination or Morgan, cash either way.—Ewers, Newton Rd., Burton-on-Trent. [3033

MOTOR Cycle Show, Olympia.—We shall be there prepared to conclude exchange deals for anything. Happy to see you.—Buntings, Wealdstone. 'Phone: Harrow 193. [3205

ROVER 8h.p., late 1922, in new condition, original tyres, etc., paintwerk unscratched, exchange for combination and cash.—James, c/o Bradmores, 482, Harrow Rd., Paddington. [3340

EXCHANGE Ford 1919 Touring, overhauled, excellent condition, tax paid, for solo, combination, cycle car; cash adjustment.—Write, Heath, 4, St. Stephen's Rd., Hounslow. [3091

B.S.A. Combination 4½h.p., 1916, electric lighting, Easting, hood, B.S.A. sidecar, enamel and plating as new; exchange solo and cash.—17, Sussex Rd., New Malden. 'Phone: 138. [2983

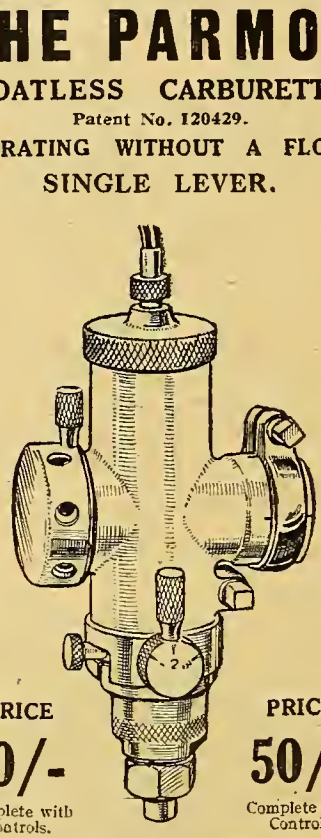
THE PARMOR

FLOATLESS CARBURETTER

Patent No. 120429.

OPERATING WITHOUT A FLOAT.

SINGLE LEVER.



PRICE 50/- Complete with Controls.

PRICE 50/- Complete with Controls.

All the advantages of the Float without the disadvantages.

WILL NOT FUNCTION ON TWO-STROKE ENGINES.

READ THIS!

GUARANTEED TO GIVE

BETTER RESULTS

ON ALL SINGLE CYLINDER ENGINES, 3 h.p. UPWARDS, AND TWINS.

NO FLOODING NECESSARY FOR STARTING UP.

NO PERIOD. EASY STARTING.

NO LOSS OF PETROL AT ANY SPEED.

GREATER POWER AT LOW SPEEDS.

GREAT FLEXIBILITY.

LOW PETROL CONSUMPTION.

SLOW RUNNING.

VIOLENT ACCELERATION AT ALL SPEEDS.

NO KONKING.

PERFECT ATOMIZATION.

THE PARMOR CARBURETTERS, Ltd.,

CARLTON HOUSE EXTENSION.

BIRMINGHAM.

EXCHANGE.

EXCHANGE Late 1919 6h.p. A.J.S. Combinatio spare wheel, speedometer, etc., for good s Triumph or combination.—Hillier (side bell), 127, Mark's Rd., North Kensington. [31

1921 2-seater Bleriot-Whippet, hood, screen, sp wheel, dynamo and acetylene lighting, privat owned; seen Berkshire; exchange for combinatio —Box 4833, c/o *The Motor Cycle*. [27

EXCHANGE brand new 1923 Coventry Prem 4-seater 10h.p. 4-cyl. for any motor cycle car and cash.—Wilkins Simpson, opposite Olymp London. Tel.: Hammersmith 238. [27

EXCHANGES a Speciality.—Good second-hand 2- a 4-seaters at bargain prices. I also supply n Matchless solos and combinations.—Seabridge, Hans Rd., East Dulwich. Sydenham 2452. [69

1918 A.V. Monocar, 6h.p. J.A.P., thoroughly ov hauled and repainted, as new, discs, electr lighting, etc., exchange for real good solo, late mod —Wigley, Walgrave, Northamptonshire. [30

1922 Dunelt Combination, 4 28×3in. interchang able wheels, legshields, lamps, horn, Cow speedometer, mileage under 2,000 for 8h.p. twin co bination.—Offers to Lucas, Builder, Usk, Mon. [30

B.S.A. 3½h.p. T.T., complete, less gear box, n handles, forks, tank, mudguard, tool bags, fra re-stoved, exchange Hobart 2¾h.p. J.A.P., gears simila Douglas, or sell.—Cooper, Charlotte Place, Margate. [28

EXCHANGE Rover 3½h.p. 1914 Combination, Luca lamps, 3-speed, speedometer, new tyres, hor and £1 per week for 15 months for good two-seat combination; Surrey.—Box 4874, c/o *The Moto Cycle*. [319

GOOD Landaulet in Exchange for good combinatio Matchless preferred, cash adjustment, value £12 dynamo lighting, speedometer, splendid condition; dri away.—Avenue Motors, 373, London Rd., Thornto Heath, Surrey. [331

EXCHANGE 10-15h.p. Seabrook R.M.C. Tourin Car, dynamo lighting, starter, hood, side cu tains, spare rim and cover, speedometer, all in pe fect condition, for landaulet.—188, High St., Win ford, Cheshire. [318

1917 Horstman 2-seater Car, 9h.p., monobloc, w.c 4 cyls., ready for the road, tax paid, spar wheel, etc., for good combination and cash either way; or sell £85.—Advertiser, 39, Essex Rd., Isling ton, London, N.1. [318

EXCHANGE 1915 W.D. 7-9h.p. Indian, spring fram kick-start, 2-speed, hand-foot clutch, all in firs class condition, for 3½h.p. Twin Indian or any chain driven lightweight.—John Turner, 84, Kirkman-Hulm Lane, Longsight, Manchester. [282

EXCHANGE 1921 G.N. 2-seater and dickey, dynam lighting, excellent condition; £100, or exchang for motor cycle or combination and cash to value.— Waldron Motor Mart, 645, Garratt Lane, Earlsfield S.W.17. 'Phone: Wimbledon 607. [305

MORGAN 1920 G.P., M.A.G. engine, disc wheels new tyres, speedometer, blue finish, as new, £89 also Rover Eight 1921, speedometer, in beautifu condition, £110; exchanges entertained.—30, Thornset Rd., Earlsfield, London. 'Phone: Latchmere 4388 [316

EXCHANGE 1922 6h.p. Combination, Coventry Victor engine, Sturmey-Archer 3-speed gear box kick-starter and clutch; accept £60 cash, or exchang for a lighter machine and cash.—Waldron Motor Mart 645, Garratt Lane, Earlsfield, S.W.17. 'Phone: Wim bledon 607. [305

EXCHANGE your motor cycle for a light car Rover 8, Coventry, Premier, etc., always in stock trial run with pleasure. Deferred payments i required.—Newnham Motor Co., 223 and 245, Hammer smith Rd., London, W.6. 'Phone: Hammersmith 1325 and 80. [322

COWEY 1915 10h.p., 4-cyl., w.o., 2-seater, dickey C.A.V. dynamo lighting, hood, screen, 8 detach able wheels, a thoroughly sound and well-made car, an trial; for a posh combination or Morgan and cash or sell £120; appointment only.—20, Treen Av., Hop ger's Corner, Barnes. [307

EXCHANGE.—If you wish to exchange your presen machine for a new or other second-hand moto cycle, combination, or car you cannot do better tha get in touch with us. Best allowances, best deliveries best everything. Full list of new and second-han machines free on request. 100 to choose from. De ferred payments if required.—Newnham Motor Co., 22 and 245, Hammersmith Rd., London, W.6. 'Phone Hammersmith 1325 and 80. [322

EXCHANGES.—Any motor cycle or car taken i part exchange for a new car; very best price allowed; immediate attention upon full particulars distance no object; arrangements made anywhere call, write or 'phone; any make supplied; authorise agents for Coventry Premier, Rover, B.S.A., Calcot Singer, Swift, Bean, Chevrolet, Lea-Francis, Humber etc.; easiest of easy payments arranged; let u quote you for any make of car; established 30 years —Wilkins Simpson, opposite Olympia, London Tel.: Hammersmith 238. [279

REPAIRERS

REPAIRS and alterations to any make machine estimates free.—Bright and Hayles, 78, Church St Camberwell. [274

The Show in Retrospect.

LIVING up to promise, the Olympia Show which closed last Saturday may be proclaimed unhesitatingly as one of the most interesting motor-cycle exhibitions ever held. Apart from the undoubted advance in design revealed, the Show was a standing monument to the British motor-cycle industry, which has grown from such small beginnings to a magnitude enabling it annually to hold an exhibition capable of attracting such large numbers of visitors.

Interest in motor cycles continues to increase, as evidenced by the fact that last week over 145,000 riders and potential motorcyclists bought *The Motor Cycle* Show report.

By drastic reductions in prices, the manufacturers have brought all types of motor cycles within the range of greatly increased numbers. In spite of more elaborate and costly specifications, prices are almost at pre-war levels, which, considering the present-day purchasing power of the pound sterling, means that 1923 motor cycles represent greater value than has ever before been offered. Furthermore, prices appear to be stable and likely to remain so, since it was apparent at Olympia that the majority were unable further to reduce their figures in order to compete with the, to them, alarming cuts made by one or two of the leading firms.

In addition there was an entirely new class of buyer at the Show. We refer to the hundreds who were drawn there by the new ultra lightweights and motorised bicycles. Undoubtedly there will be a great influx to the ranks of motorcyclists next year.

For the first time since the war there was also practical interest on the part of wholesale buyers from overseas, who were booking contracts for lightweights, a type of machine which Britain produces better than any other country.

Altogether, we think the exhibitor at Olympia has every reason to be as satisfied with the results of the Show as were the thousands of motorcyclists who expressed their approval of the efforts made to satisfy their demands.

An Amateur Road Race at Last.

AS recorded elsewhere in this issue, it is practically certain that a race for amateurs will be run in the Isle of Man next September. The Manx Motor Cycle Club has been promised an open permit, and this will be used for an amateur race over the Tourist Trophy course, the organising club being satisfied that the definition of an amateur suggested by *The Motor Cycle* in February this year, in every way covers requirements.

Now that the Manx Club and the Auto Cycle Union are in agreement over the race, *The Motor Cycle* has been invited (and agreed) to provide the trophy which shall be the premier award.

Without doubt the event will be an extremely popular one among amateur speedmen all over the British Isles, and as the term amateur has long needed a definition in the motor cycle world, the proposed amateur race may be regarded as a test of honour as well as of sheer riding ability. It will, therefore, behove every competitor to adhere strictly to the spirit and letter of the rules in order that motor cycling may take its place among those other sports in which the terms amateur and professional have a definite meaning.

The nature of the Manx course is such that super-tuning is not so important as skilful riding; therefore, no amateur in possession of a reasonably fast and controllable machine should hesitate to compete on this score.

The Manx Club is to be congratulated upon its perseverance and enterprise, which a very large section of riders will appreciate to the full.

An index to the advertisements in this issue will be found on the page facing the back cover.

OCCASIONAL COMMENTS

BY IXION

How is it Done?

A GOOD many British makers wish it were possible to construct motor cycles over here as cheaply as it is done in America. I heard two or three costing experts analysing the price of a certain imported twin-cylinder—and no dud at that. They decided that the actual cost f.o.r. at its trans-Atlantic town of origin, inclusive of overhead charges, but without allowing for manufacturers' profit, could not exceed £40. What would our roads be like next June if home conditions allowed the big Zeniths and Brough-Superiors and Matchlesses to be produced for retail sale at, say, £60?

What Did They Sell?

I WONDER what the exact volume of sales at the Show amounts to, apart from contracts with distributers and agents. I asked three friends on the Monday morning how they were doing. Their answers are appended (they were all small men):

A.—I've had over 1,000 inquiries.

B.—I sold one this morning.

C.—I sold 400 before I came up, and I've placed 160 more since the Show opened. As I'm only laying down 1,000 this year, I shall have a smile that won't come off by about Thursday.

Permutation and Combination.

THAT was the heading of the chapter in the algebra book which decided my schoolmaster that manual labour might prove to be my *forte*. But how I wished I'd mastered that chapter when I had to report how many models a certain firm turn out. They list eight different engines, and give you anything from three to six transmission options with each engine. Another concern's idea of a sound production policy is to stick rigidly to one size and type of engine and ring their changes on the fittings.

Transferable Dynamos.

AN electric lighting firm counter my demand for dynamos which shall be readily transferable from our 1922 to our 1923 machines by the remark that "Ours *is!*" I devoured their catalogue as a schoolboy tackles his second ice-cream—*l'appetit vient en mangeant*. Its brackets were ingeniously designed in all conscience; they would locate the dynamo adequately on almost any 'bus. The drive? Well, the type of drive which they push is a small friction wheel rubbing on the flywheel. As my flywheels are encased, I should have to cut a hole in the cheek of my crank case, and then make a cover to prevent the oil coming out; after which the aforesaid oil would undoubtedly destroy all grip between friction wheel and flywheel. A postscript added that pulleys were supplied for belt drive on inside flywheel machines. Quite apart from the trouble which a naked belt can give when it runs over small pulleys at short belt centres, there is absolutely no place on my machine for fitting a pulley. As the same is approximately true of very many machines on the market, I am driven to conclude that some of these electrical firms turn out dynamos without studying the motor cycles for which their dynamos are intended. Incidentally, the catalogue in question rather throws cold water on the so-called "dymags.," which are neat, efficient, and very easily fitted, though, unfortunately, too expensive for many of us.

"Ixion's" "MOTOR CYCLE REMINISCENCES" are available in book form, price 2s. 9d. post free, from "The Motor Cycle" Offices, Dorset House, Tudor Street, E.C.4.

A Fact.

I SPOTTED a cheap machine labelled as possessing "automatic lubrication." Failing to discern any mechanism but a sump with a filler cap, I tackled the demonstrator. "You just fill it up through that hole, and it does the rest!" Unwilling to believe that he used nothing but flywheel splash on a constantly sinking oil level, I persisted, "Yes, but *how?*"

DEMONSTRATOR: "*The engine churns it into a kind of foam!*"

And there wasn't even a level peephole in the side of the crank case.

How to Draw a Crowd.

ACCORDING to an Olympia expert, there are three ways of causing a crowd to cluster around your exhibit. The first and simplest is to stage something that moves. (Gear boxes driven by concealed electric motors have been rather overdone. So have magnetos and speedometers. But an oil pump or a propeller mascot are a sure draw.) The next best is something that makes a noise. (Not a mere hooter. You can do the needful with a gear box if you are careful to look worried as you joggle the lever.) The best of all is to have an argument with a spectator. The man who criticises your exhibit foolishly is a god-send in disguise. You begin, loudly, "Hey, you, sir!" And then fall upon him. But you grow a little weary of it by the Wednesday.

Occasional Comments.—

Tantalising.

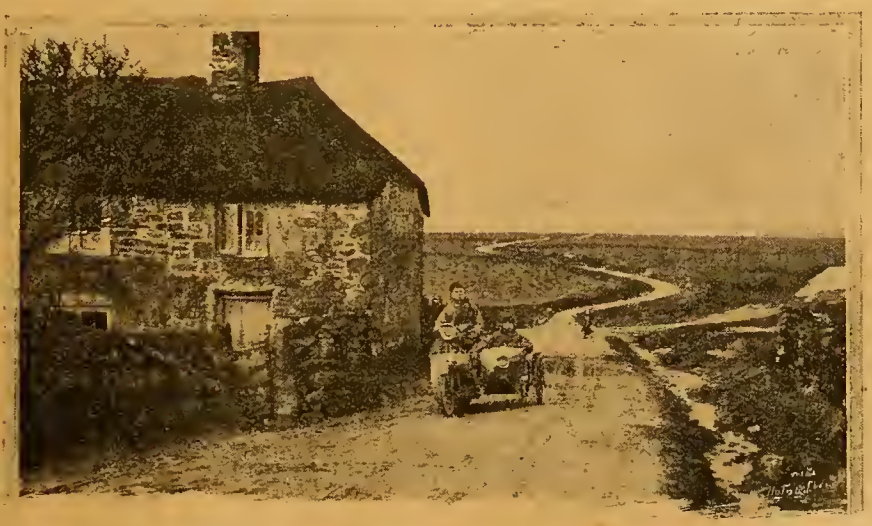
I HEAR rumours of a completely new lighting equipment, which eliminates oil, gas, and acetylene at one sheer swoop. What can it be? Is it a new radium paint to be applied to the rider's visage, or what? My lips are sealed for the moment, as the sergeant-major gurgled when a shell deposited a lump of fresh tarmac in his gullet.

Tempora Mŭtantur . . . .

I ALWAYS garnish my pages with Latin tags to camouflage the fact that I was educated partially in the gutter and partially at a Board school. What I want to say is that veterans like myself might be pardoned for going down on our hams and doing *pujah* to the modern sidecars and cycle cars, as the untutored Hindu did to the first locomotive which he beheld. My first passenger machine was a Century tandem—not at all bad. its chief merit being that the passenger was stuck right out in front to take the impact after any miscalculation on the driver's part. My second was an Excelsior forecar. You could remove the forecar, insert a spare wheel, and use the machine as a solo mount. If you did not deliberately take the forecar off in garage, it generally dropped off on the road. My third was a Dennis quad. Its best point was its mudguards—lovely rolled aluminium. The stage comedians junk car generally has four speeds—slow, slower, —— slow and ——, —— slow. My Dennis quad had only two—the two last. Then I bought a sidecar. It was a wonderful vehicle—but it went!

A Cloud on the Horizon.

THERE are those who say that the sidecar is past its zenith. Undoubtedly the modern "baby four" (otherwise a complete small car of Lilliputian dimensions) is going to hoist the red light over the passenger machine market. I am not so sure. Under equally scientific conditions of design and manufacture a 1,000 c.c. sidecar outfit *de luxe* must be appreciably cheaper than a 1,000 c.c. car. It should also be cheaper to run and have a better road performance. Second-hand small cars? Um! I do not like having to reap the harvest of another fellow's misdeeds. But, anyhow, the 500 c.c. sidecars are miles below small car prices; and whatever happens in the 1,000 c.c. sphere, the smaller outfits will remain.



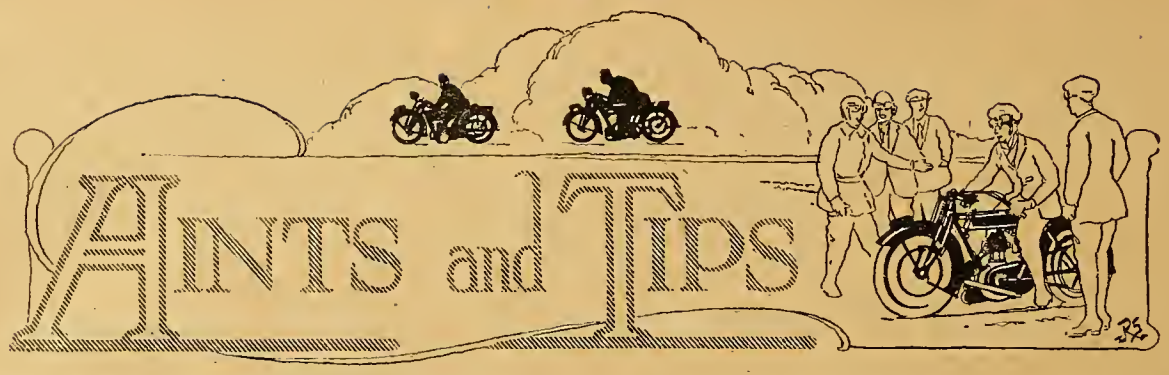
PICTURESQUE DARTMOOR. A typical moorland road near Tavistock. A district which Mr. Eden Phillpotts has freely portrayed in his epic novels set in that wild country.

Against Glare.

A READER has sent me a pair of experimental anti-dazzle goggles, which he will probably market shortly. Oddly enough I saw another pair next day designed on a trifling variation of the same principle. Both goggles had their lenses built up from two pieces of glass. In each case most of the peeping space was white, but each glass included a dark blue or green panel. In one case the subfusc insertion was a horizontal sector at the top of the glass; in the other it was a vertical sector on the right-hand side. On meeting a 30-98 h.p. Vauxhall at speed with huge lamps, the rider merely tilts his head downwards or to the left, according to which type of goggle he is wearing, and takes the glare through the coloured glass. A writer in *The Autocar* asserts that before glaring head lamps motorists behave like a small bird when fascinated by a serpent with a Svengali eye. That if we only had sufficient strength of mind not to look at head lamps, we shouldn't be dazzled. If that is so, I am a small bird, and have a weak will. I find the dark panels in both these goggles excessively comforting.

One Cause of "Bad Service."

INVESTIGATING one or two cases of riders receiving unsatisfactory "service" from factories, I have noticed that in more than one case the root cause does not lie at the door of the manufacturer. It is common knowledge that the weird oscillations of supply and demand since 1919 have at various times brought many concerns, little and big, into financial difficulties. In most cases these have ended at the introduction of fresh capital. Fresh capital has not infrequently implied a new management; and with the new management there has occasionally been a tolerably complete change of staff. It is obvious that these newcomers must flounder about a little before they can get all the ins and outs of a large and perhaps old-established business at their fingers' ends. They only discover gradually what their predecessors did, and how they did it. Card indices often get into a pretty muddle, for example, during the sequence of slack trade, dismissals, liquidator, fresh capital, new staff, and so forth. Such vicissitudes are very trying all round; and the unfortunate rider, who may suffer during the process, should remember that the harassed people at the factory end are having may be an even worse time than he is.



It has always been one of the chief aims of "The Motor Cycle" to assist the novice, and every issue since No. 1 appeared, twenty years ago, has contained authoritative and helpful articles so written that the most technical subjects are readily understood.

The following notes are intended exclusively for the beginner and are compiled in order to explain many points which at first may mystify the tyro. Even experienced motor cyclists are constantly exchanging "hints and tips," from which fact the novice must not, however, assume that the motor cycle as a vehicle is so complicated that it is necessary to acquire a technical and practical knowledge of motor mechanics before ownership may become a pleasure.

THE rawest novice, before he can understand anything about the running of his motor cycle, has to call to mind, without any prompting, the magic formula: induction, compression, explosion, exhaust. First get your gas into the cylinder, as a motorised version of Mrs. Beeton might say, then compress it—explode it—and finally push it out again. In the four-stroke engine the piston very obligingly assists in performing these operations automatically, stroke by stroke. In the two-stroke engine all four operations have to be contracted into one up and one down stroke of the piston. Thus the two-stroke engine has one power stroke every revolution of the flywheel, as against every other one of the four-stroke engine. Consequently the two-stroke engine ought to be a much smoother running power unit—equivalent, in fact, to a two-cylinder four-stroke with an even firing interval between its two cylinders.

TWO-STROKE AND FOUR-STROKE.

SUCH is actually the case when the engine is pulling under load. Then a two-stroke engine runs with an even, pleasing hum. There should be no jerkiness in the drive, even in top gear at a slow pace. Principally, however, the two-stroke engine scores by the absence of any valve gear, cam wheels, tappets, and valves themselves. The piston of a two-stroke engine is the only valve that is needed, and as it has got to go up and down the cylinder anyhow, it can quite easily open and close the inlet and exhaust ports on the way. The underside of the piston draws in the gas from the carburetter into the crank case, whilst the upper surface of the piston is compressing the next charge ahead on its way up the cylinder. When the explosion has taken place, the top of the piston uncovers the exhaust port, and the gas finds its own way out, aided by the rush of the incoming charge which the downward passage of the piston has compressed in the crank case until the piston uncovers the transfer port through which the gases pass to the cylinder from the crank case.

THE ADVANTAGES OF THE TWO-STROKE—

IF everything functioned as smoothly as it sounds in theory, one might imagine that the four-stroke engine, with its complicated valve gear, was an unnecessary elaboration. The two-stroke, however, falls short of the ideal in certain respects. In the first place, the intermingling of the incoming charge with the exhaust gas results in a proportion of new charge finding its way down the exhaust pipe without having served any useful purpose. This very naturally causes the fuel consumption of a two-stroke engine to be somewhat higher than that of an engine which usefully consumes all its fuel. Again, since the exhaust gas is left more or less to find its own way out of the cylinder, it follows that the silencing arrangements must offer absolutely no obstruction whatever to the passage of the gas, which will otherwise not quit the cylinder. Further, on small throttle openings there is insufficient inducement for the burnt charge to leave the cylinder, with the result that it dilutes the fresh gas and causes irregular firing. Hence a certain amount of spluttering with a two-stroke engine when running light.

—AND ITS DRAWBACKS.

IN weighing up the pros and cons of the two types of power unit, therefore, one may safely say that, for small machines of the kind known as "miniatures," the two-stroke engine has great advantages, in that there are no microscopical parts that should rightly be entrusted to a model-maker. For anything between 250 c.c. and 350 c.c. capacity the four-stroke possesses certain mechanical advantages which can be outweighed by the two-stroke only on the scores of economy and simplicity. Above 350 c.c. the four-stroke engine reigns supreme save for sundry unconventional types of two-stroke, of which one may instance the Dunelt, where the underside of the piston, which effects the induction of the fresh charge, and, later, its transference to the cylinder, is of greater diameter than the top, so that a larger volume of new gas is forced into the cylinder, and, correspondingly, more burnt gas is pushed out.

THE FOUR-STROKE ENGINE.

THROUGH A DESIGNER'S EYES.

A Technician Studies the Lessons of Present-day Motor Cycle Design.

Unit Construction. Vogue of Small Engines. Improved Manufacturing Methods.

AS one returns from Olympia and its maze of glittering motor cycles, two points stand out above all others in the mind of the observer. First the amazing price reductions effected on every hand, and secondly the influx of miniature motor cycles which are undoubtedly the skirmishers of a huge army of self-propelled vehicles suited to the requirements of that mysterious person "the man in the street."

Both of these features are directly attributable to technical improvements in design, manufacture, and production, and it is well that the buying public should realise that the present welcome tendencies have been brought about by hard work, competition, research, and road and track events.

When one comes down to detail, there is such a mass of minor improvement that it is impossible to do more than touch on some of the more important features, and the careful student of motor cycle design must rely to a certain extent on his own observation and on a careful perusal of the detail descriptions already published in the pages of *The Motor Cycle*.

Unit Construction.

The limits in weight reduction, compact design, cheap construction, and efficiency are not likely to be reached until the question of unit engine and gear construction has been further explored. Yet until recently the British firms which had tackled the problem seriously were almost negligible, and this in spite of the fact that almost every post-war motor cycle of note emanating from either America or the Continent included this feature. Now, however, we see a change, and there is a definite lead in this interesting direction, while there are excellent grounds for believing that even further new units will appear before the next Olympia exhibition.

By the employment of unit construction it is possible to eliminate the primary chain or alternatively to let it run under ideal conditions, immersed in oil. It is possible also to eliminate at least part of the normal magneto drive and to provide a constant flow of oil to all engine and gear parts without employing a single external pipe. In addition the inclusion of an oil well of reasonable magnitude and a considerable increase in the crank case area should help to cool the engine. All these features, either in detail or in bulk, are included in the various designs now before the public, though it is doubtful if, as yet, any material saving in weight has been effected. The tendency to adopt unit construction runs throughout the range of sizes from the largest to machines of under 200 c.c.

Six or seven makers dispense entirely with the front chain, while others still use a primary chain; an intermediate course of building up separate engine and gear box into a unit is followed by another school of design.

Pistons and Piston Rings.

On standard touring machines cast iron is retained almost universally as a piston material, and there has been very little alteration to the normal piston design. There

Through a Designer's Eyes.—

are usually two or three rings above the gudgeon pin. There is a tendency to increase the employment of narrow rings, however, and not a few designers have realised the importance of plenty of metal behind the rings.

Nevertheless, it is useless to provide an easy path for the heat flow from the piston head if the wall area below the rings is insufficient, and consequently the number of " waisted " or relieved pistons is somewhat surprising. If clearance at the gudgeon pin bosses is necessary to allow for distortion it is easy to arrange it without relieving the full circumference of the piston which spoils contact at vital points.

For sports models aluminium alloy pistons with narrow rings are common, and in some few cases a choice of cast iron or aluminium is available. Some of the best aluminium piston designs show but slight saving in weight over their cast-iron prototypes, since it has been found to be preferable to utilise to the full the heat dissipating qualities of the alloy rather than to cut reciprocating weight to the minimum. In spite of this, one or two of our best-known makers are fitting ultra-light slipper-type aluminium pistons in their speed mounts.

In the majority of cases the aluminium alloys contain a fairly heavy percentage of copper—up to 12% —but the magnesium alloys, which, on account of their very light weight and high conductivity, will undoubtedly make their presence felt in the near future, have not yet reached the public in production machines.

Piston slap, due to large clearances necessitated by the high coefficients of expansion of most aluminium alloys, is the main factor which is retarding the general adoption of aluminium pistons, but it is more than likely that this bugbear will be eliminated in the future as a result of increased knowledge of requirements and metallurgy. Steel pistons, as far as motor cycles are concerned, are, to all intents and purposes, extinct.

Flat-top pistons are the rule, but in most of the high-efficiency overhead-valve engines with hemispherical heads and inclined valves it has been necessary to dome the heads in order to obtain sufficiently high compression ratios.

Compression ratios have been raised to some considerable extent, and the average touring engine of medium capacity has a ratio of well over four to one, while some of the small racing engines go as high as seven to one.

One-Piece Cylinders Popular.

Composite cylinders show no signs of multiplying, and in at least one of the few examples staged at Olympia the high-conductivity metal, in conjunction with a liner of comparatively low conductivity, was applied to the cylinder barrel only and not to the head, which latter is by far the most important point as regards heat dissipation. Cast iron, therefore, remains supreme for the construction of cylinder heads and barrels, yet great improvements have been made as regards cooling arrangements.

Not only have cylinder heads been thickened up to quite a considerable degree, but cooling ribs are more often disposed with some definite relationship to the direction of air flow. Both these points will help to reduce the number of engines given to pinking and to delay the necessity for decarbonisation.

Apart from an increase in the number of overhead-valve engines—by far the easiest type to cool—those who have decided to retain the side-by-side valve arrangement have obviously spent some thought on the problem of providing air passages to those important spots behind the exhaust port and at the junction of

the valve chest and cylinder walls. There were indeed some very fine pieces of cylinder design in the Show. One important point is the striking tendency to arrange almost the whole of the compression space above the valves in an endeavour to obtain greater turbulence and consequently a higher rate of flame propagation.

Between the overhead and side-valve types come the few examples of superimposed valves, usually with inlet over exhaust. This well-tried system has its advantages, but the type with exhaust over inlet would appear to be worthy of a greater following, since it should be an easier matter to provide ample cooling for the highly-heated exhaust port and valve stem.

Detachable cylinder heads are not on the increase, and it is particularly noticeable that one of the best-known proprietary engine manufacturers has instituted new models of small capacity with unit cylinder and head, though the earlier productions of the same make were of the detachable head type.

Whether the change is due to manufacturing reasons or to the fact that with unit construction a larger effective radiating area for the head is possible only the manufacturers can tell, but in these days of high-efficiency engines the latter point is not without importance. It is true that many of our high-efficiency engines have detachable heads on account of the difficulty of fitting inclined overhead valves with unit cylinder construction, but in these cases one is apt to make a virtue of necessity and to emphasise the improved accessibility of the type instead of treating it as an unavoidable and possibly even an undesirable feature

Valves and Valve Gear Mechanism.

With the improvement in modern alloy steel has come a corresponding improvement in valves. It is possible nowadays to produce a perfectly reliable valve which is no more than $\frac{1}{16}$in. thick in any part. Thus it has been possible to reduce reciprocating weights, valve spring pressures, and consequently the wear on operating gear.

An example of such extreme practice would have been hard to

Through a Designer's Eyes.—

find, but only a casual scrutiny was needed to reveal not only considerable improvements in this respect, but also attempts to design scientifically correct radii under the valve head in order to ensure the passage of the maximum possible amount of gas through a port of a given size.

As regards cam gear one finds an almost uninterrupted series of tangent or concave faced cams operating plain tappets through rocker gear. In just a few instances cams of this type operate direct on round base tappets, but it is curious to note that the flat base tappet and convex cam is almost unrepresented in the motor cycle world. One would have thought that, with all the efforts towards price reduction which have taken place in the last year or so, some effort would have been made to eliminate the numerous and weighty rocker arms with their attendant pivot pins, which are almost invariably hidden within the mysterious recesses of our timing boxes. There are several methods which have proved satisfactory in car practice and which are both cheaper and lighter than the rocker system.

Rockers

On the other hand there is a definite excuse for the existence of rockers in certain systems, notably when a single cam is utilised to operate both inlet and exhaust.

In a few cases some effort has been made to enclose valve gear, a point which is worthy of more consideration, for, though these covers have no very marked effect on the silence of a *new* engine, they should, if properly constructed, exclude dust and include oil, thus prolonging the period of comparative silence and preventing air and oil leaks and numerous attendant troubles of a minor nature.

Transmission.

Since the standardisation of the countershaft gear, one has not been led to expect any very startling changes in motor cycle transmission. As usual one may sum up the situation by saying that there are a few more chains and a few less belts, but there are in addition other features to be highly commended.

First, we have a new shaft-driven motor cycle of British manufacture, possibly a forerunner of future designs. Secondly, we find a considerable increase in the number of four-speed gears, while there are even more on the stocks which are likely to put in an early appearance; and, thirdly, we find a tendency on the part of gear manufacturers to include a shock-absorbing device in the clutch. Is this a reflection on some of our engine-shaft absorbers? Probably not; it is much more likely to be a genuine attempt to produce a real improvement which will increase the life of engine, gear box, chains, and tyres, and to provide the rider with a greater measure of comfort.

For the first time a machine containing a proprietary engine and gear box makes its appearance with totally-enclosed chains, while another ingenious designer utilises the long exhaust pipe as a chain guard with the addition of sheet steel flanges where necessary.

Shock absorbers are almost uni-

Through a Designer's Eyes.—

versal and are divided into three main groups—the engine-shaft absorber (usually of the face cam type), the combined clutch and countershaft absorber, and the cush type rear-wheel drive.

Frame Construction.

When the average constructional engineer examines a motor cycle his first criticisms are usually directed against the arrangement of tubes which forms the frame. Theoretically, perhaps, he is right, but in practice it is extremely doubtful if he can evolve anything which is cheaper and lighter and which can show a reasonable reduction in weight. At any rate the epoch-making substitute has yet to be found. We have no intention of disparaging the ingenious pressed steel and tubular constructions which appear at intervals, but rather would we point out that motor cycle frames are not as bad as they are (sometimes) enamelled!

Olympia revealed a movement towards the duplex frame with tubes running direct from head lug to rear spindle, supported in some cases by a duplex loop construction forming a cradle for engine and gear box.

Spring frames remain more or less *in statu quo ante*, and not much improvement is noticeable in this direction, our old friends remaining without much fresh support. It is necessary to mention one important innovation which has taken place in front fork and sidecar suspension, which takes the form of a friction shock damping device working in conjunction with a weak spring. In the case of one fork a 7in. total movement is allowed, and the rebound is slow and smooth in action. Frame details show a genuine improvement, and there has been a general cleaning up of clips, head lugs, wheel adjustments, brake stops, etc., while grease gun lubrication of cycle parts is on the increase.

Lubrication.

Since so much wear and tear, noise, and expense is due to faulty lubrication, it is encouraging to find that a large number of firms have decided to remove the matter from the somewhat inexpert hands of their customers and to refer it to some form of mechanical contrivance.

For the first time we have with us more than one genuine dry sump lubrication system, and its simplicity and efficacy are sure to attract others, though in the meantime we continue to rely in the main on the excellent productions of certain accessory houses which have been considerably strengthened by the addition of new designs and the improvement of previous articles.

Special Engines.

Throughout the year much interest has been shown in the single-sleeve valve engine. Its performances have been so consistent that the reinforcement of the 350 c.c. single by a 500 c.c. single and 1,000 c.c. twin can hardly have been unexpected.

A 350 c.c. four-stroke with an overhung crank and a smaller four-stroke with flywheel magneto are novelties which attracted considerable notice, but in general the outline of the normal engine remains unaltered. Especially is this the case with two-strokes, where only detail modifications have taken place.

The Burning Question.

What shall it be next year?

Heard at Olympia.

"Oh, yes, that's the racing model. They fit a high-speed magneto and lubricated piston."

Lowered Prices.

To the chagrin of the few and pleasure of many, prices are down as much as £70 in the case of some sidecar outfits.

Still a Price Gap.

The big lowering of prices at Olympia silenced the prophets who forecasted the demise of the powerful sidecar because of competitive prices in the car world.

Why Not a Gramophone?

Many of the Olympia salesmen had apparently learned particulars of their exhibits by heart. When one asked a question they drew a deep breath, and repeated a long string of facts, parrot-like.

Catering for All.

In marked contrast to the several exhibitors at the Show who listed only one model was the firm whose catalogue contained details of no less than twenty-six distinct variations.

American Opinion.

American writers on motor cycle matters are keenly interested in the T.T. sidecar race. They maintain there will be less danger on the twisty Manx course than on a saucer track, because the drivers will so frequently be reminded of the perils that obviously exist and consequently take extraordinary precautions.

Double-acting Two-stroke Coming.

Wonderful efficiency is anticipated from a double-acting two-stroke engine now being built in Portsmouth; 12 i.h.p. and 7 b.h.p. are suggested; the total piston displacement is only 320 c.c. It will make an appearance on the road, and possibly on the track, in January, before which date we hope to describe it in full detail.

Why this Solemnity?

Few documents, with the exception, perhaps, of a summons, make duller reading than the average club announcement.

Possibilities in Czecho-Slovakia.

There is said to be a big opening for British machines in Czecho-Slovakia at the present time. Many well-known British machines are represented, and B.S.A. and Indians are the motor cycles used in the new Republic's army.

North-Country Enterprise.

So as to ensure booking an early date for *The Motor Cycle* film for 1923-4, Mr. W. A. Dovener, Secretary of the Bradford M.C. and L.C.C., has asked us to reserve the first three days for his club after it is released at the next Olympia Show.

Next Best.

The maker of one of the most popular runabouts used a Rolls-Royce car to get to and from the Show. On being twitted by a friend his excuse was that of Mr. Henry Ford on a similar occasion: His own works were so busy filling orders that he could not get delivery of a runabout, and so bought the next best.

A Royal Customer.

The Queen of the Belgians, an enthusiastic motor cyclist, has paid the British industry a high compliment by purchasing a lightweight model from the show for her personal use. At Olympia on Tuesday an official from the Royal Garage at Brussels purchased on her behalf a standard 169 c.c. McKenzie with nickel plated frame, wheels, and fittings, the petrol tank and mudguards being enamelled mauve with gold lining.

Lieut.-Colonel Charles Jarrott, O.B.E., the new Chairman of the A.A. and M.U. in succession to Sir William Joynson-Hicks.

Super Perfect.

We do not vouch for the truth of the rumour that a certain rider completes the cleaning of his shiny mount with a liberal application of eau-de-Cologne.

Satisfactory Route Marking.

At a recent reliability trial the course was marked by confetti, and the competitors agreed that it surpassed the more usual dye in every way; the white patches of confetti were visible at a long distance, and remained in place in spite of a fair wind.

Stymied.

An inquisitive policeman, equipped with an iron rod and the usual voluminous notebook, strolled round competitors' machines at the start of a trial, and found fault with every exhaust system. Presently he came to a competitor who, in view of possible watersplashes, had mounted an elaborate petrol can-cum-flexible piping silencer on his carrier. "Go on," said crestfallen Robert, "get orf with yer, quick."

The Amsterdam Show.

The fourteenth annual exhibition of cars, motor cycles, cycles, and accessories, organised by the Dutch Union "De Rywiel-en Automobiel-Industrie," will be held at Amsterdam from February 9th to 18th next, and the number of exhibitors has reached a total of 128, an increase of 50 on last year's figure. The growing popularity of motoring in Holland—and the cult of the motor cycle in particular—should enhance the appeal of this exhibition to British manufacturers.

"Not Technical."

In the last issue reference was made to the lack of knowledge of many of the stand attendants at Olympia. The lay press makes similar complaint, and the following dialogue was recorded in the *Evening Standard* of a few nights ago:—

"What are your gear ratios?"

"I am afraid I don't know."

"Have you a catalogue which gives them?"

"I am afraid not."

"How much does the tank hold?" (Hesitation.)

"Half a gallon?"

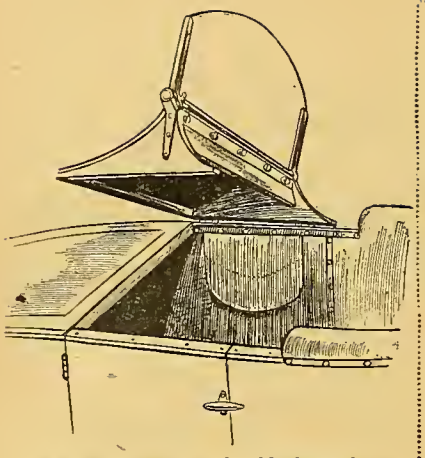
"Oh, I should think so."

"Two gallons?"

"I should think so."

"Is the machine over or under 200lb.?" (Meaning the difference between a thirty shilling and a three-pound licence.)

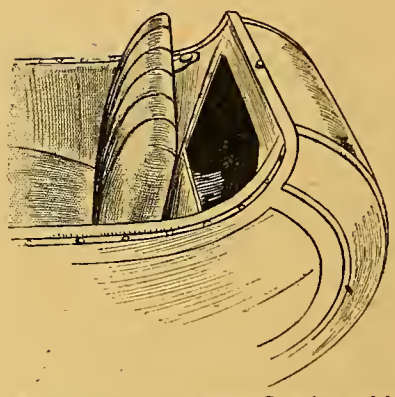
"I really don't know. You see there's nobody technical here!"



Scuttle and screen on the Hughes sidecar.

From the PASSENGER'S POINT of VIEW

Worth-while Detail Improvements on Sidecars.



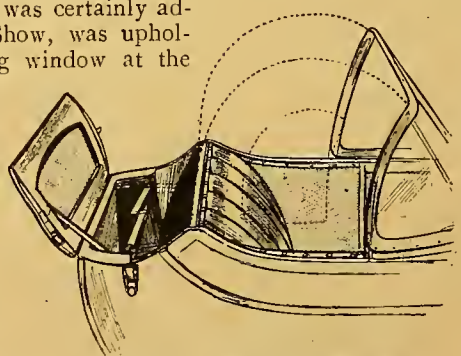
Ample locker on the touring Canoelet model.

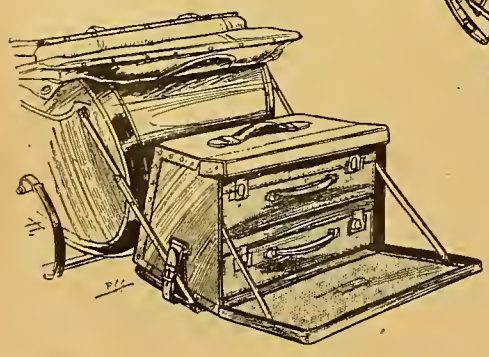
BY "FRIAR JOHN"

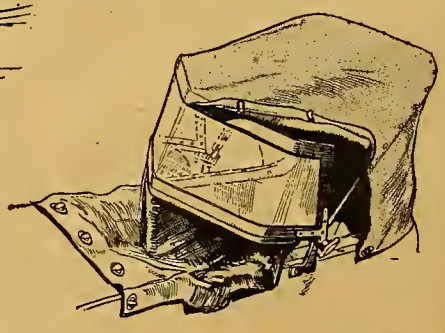
THERE were numerous gadgets and little refinements on many of the sidecars this year, but the bizarre and fantastic was absent. Though manufacturers are always willing to associate themselves with any new ideas, there was a reticence this year in adopting new designs unless there was a very good reason for so doing. And quite a wise plan too.

The resolve to improve existing patterns after finding out weaknesses is a saner policy than frequent redesigning. I say "frequent" for occasionally a thorough "scrapping" is justified and a restart the only cure for a tranquillity that may have turned to torpor. A walk among the exhibits and a talk to the manufacturers proved, however, that no apathy exists among makers. They are all anxious to please customers and to give them precisely what they want. Sidecars are there to meet all purses, from the £14 14s. sporting models, to the polished aluminium cabriolet shown attached to a Metro Tyler model at £64. This enclosed sidecar, which was certainly admired as much as anything in the Show, was upholstered in Bedford cord, had sliding window at the side, and swing "halfed" windscreen, a little locker for looking glass, gloves and powder puff; and then, to finish the effect of modernity, there were wireless receivers hanging in the corner. All metal parts were either nickel plated or highly polished aluminium. But the most admirable feature of the sidecar was its light, dainty appearance and comfortable-looking, electrically lit interior. But to speak of sidecars and sidecar details on the every-day models. Starting among the lower numbered stands there was the Coventry Victor "Ghost" materialised in a solid little sporting body—a nice little sidecar; the Massey designers, too, have evolved a little sidecar which looks small, yet provides astonishing room—a good design, too, with its cast aluminium dash.

The Clyno people have behind them years of experience in the making of sidecar outfits, and this year's sidecar model reveals the practised and practical mind. In providing a small locker that may be devoted solely for the passenger's use or for tools—on the floor of the sidecar adjoining the well of the seat, and a sidecar with a back high enough to protect the passenger, the Clyno designers are to be commended. But these are only details of a sidecar and chassis as attractive as any in the Show. Near by was the new Holt transparent hood on a Coventry Victor



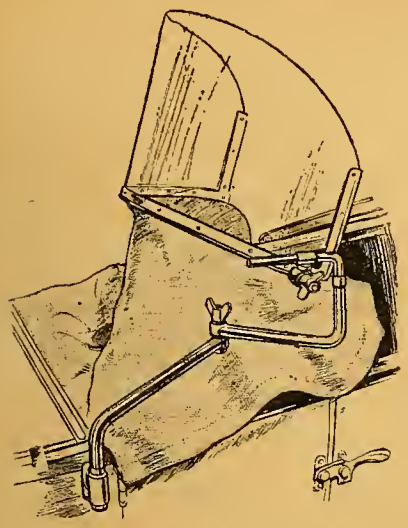


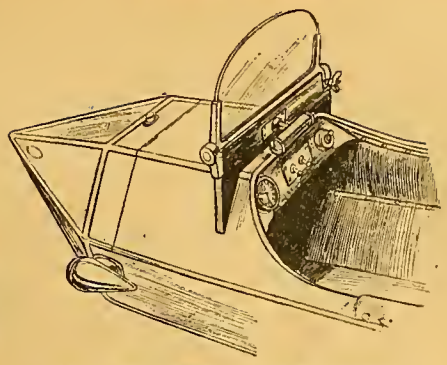


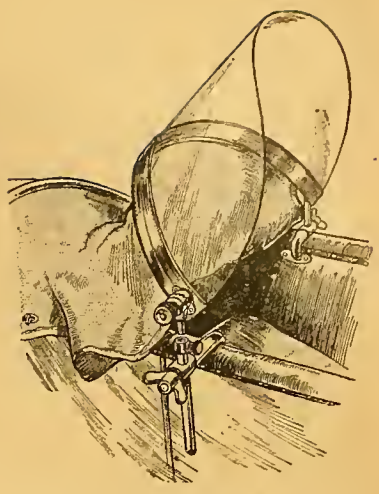
(Left) "Two in One" suit case designed specially for sidecars by Messrs. Dunhill.

(Top) Showing how completely the hood is concealed on the Coupette sidecar.

(Right) Sandum all-weather screen and hood.







(Left) Easily adjustable Grindlay screen for sporting models.
(Centre) Neat dashboard and screen of the Hawk sidecar.
(Right) Method of detaching the Montgomery adjustable windscreen.

outfit—a unique pattern that should be effective; it is light in weight and appearance, being made solely of celluloid. It is made to slip on the circular windscreen in the manner of the beaded edge of a tyre. It is simplicity itself, and rolls up when not in use into a case about as long as a six-piece fishing rod. A sidecar about which nothing but nice things can be said is the Martinsyde standard model; it was not a "frilled" specimen, so to speak, but one in which a person could tour in comfort. The body is roomy and ample luggage can be carried on the new folding grid, which is built to stand any reasonable stress. The little aluminium detachable screen and dash shown on the Watsonian stand was also attractive and showed incidentally what an amenable material sheet aluminium is, for it yields to the metal beater beautifully; this dash, complete with screen, sells for £4.

Neat Detail Work.

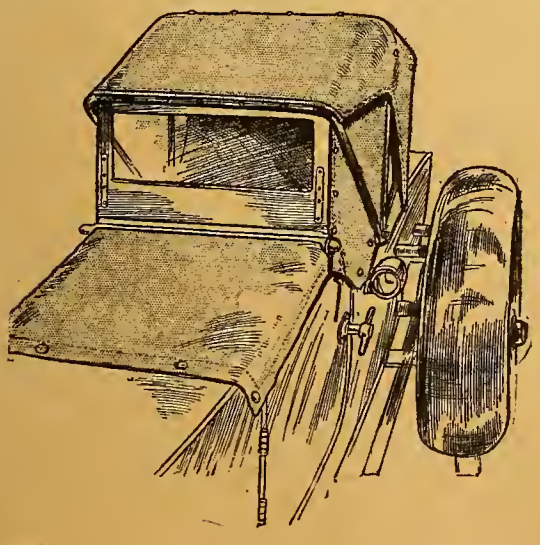
A sidecar of special appeal came from Nottingham. The black leather upholstery, and the screen which was carried in a leather-covered frame, the neatly folding hood, aluminium step, neat mounting of the electric lamp, and ample pockets for maps and gloves proclaimed the pains taken in the production of this Campion model.

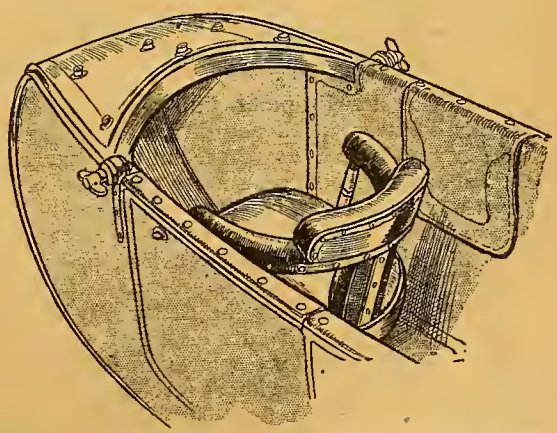
One passed the A.J.S. stand with its usual crowd, knowing from experience that the big sidecars staged were as perfect as can be. The double seater was there, too, poised up out of way of any but the most determined "triers."

If one is anxious to add distinction to the outfit when touring, Dunhill's "Two in one" case should be examined. It fits snugly on the grid, holds two suit cases, and is quite water tight. The cheap model is 45s., complete with two suit cases. A very noticeable detail on the two-seater sidecar was the fitting of mahogany arm rests instead of the usual padded variety.

Real Locker Accommodation.

Why the cream-painted *de luxe* sidecar was tucked away at the back of the O.E.C.-Blackburne stand I don't know, for I should place it as one of the most alluring in the Show. The resplendent mahogany dash complete with clock, speedometer, and, of course, mirror, triplex screen, and a felt-lined locker ample enough for a half dozen ladies' hats are details of this model. £39 18s. was the price asked.





(Left) An accurately fitting hood and screen on the Enfield touring sidecar.
(Right) The comfortable child's seat provided in the Millford family model.

From the Passenger's Point of View.—

The "star turn" on the Montgomery stand has already been mentioned—the blunt-nosed streamline sporting model, the polished aluminium mudguard of which would be worthy of a three-litre sporting car.

Turning to the familiar Douglas exhibits, one marked a slight alteration in the graceful scuttle dash and screen which pushes to and fro on runners instead of hinging in the more usual manner. The detailed alteration is in the shape of the screen.

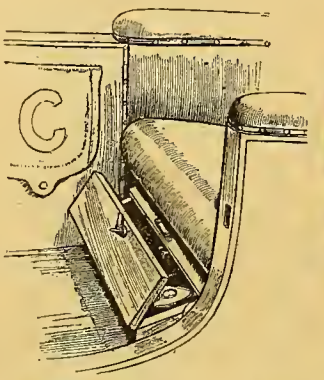
For the man who wants a thoroughly well-built sidecar in which his wife can repose in comfort and feel too that she is sitting in, instead of on, a sidecar, the Chater-Lea should attract, for the model exhibited was very roomy. On a stand near by—the P. and M.—there were several details of decided worth amongst the sidecars. The draught-proof fitting of the Bluemel screen for instance (a P. and M. device), the little locker beneath the dash for gloves, and the luggage grid on the semi-sports model were worth more than a passing glance; the designer, too, of the light sports model is to be congratulated. It has more *chic* than any in the Show, and a change from the usual streamline pattern.

On the Enfield sidecar there are two little gadgets worth mentioning. Turning the pocket of the sidecar door into a tool box is a cute idea that appealed to all who are not among those lucky individuals who motor 10,000 miles or so without touching the wrench, pliers, or tyre levers. To find the tools nicely arrayed ready for use by just opening the door is a simple but obvious advantage. Another Enfield fitment is the twill leg shield which clips on the body of the sidecar and the down tube on the near side of the machine.

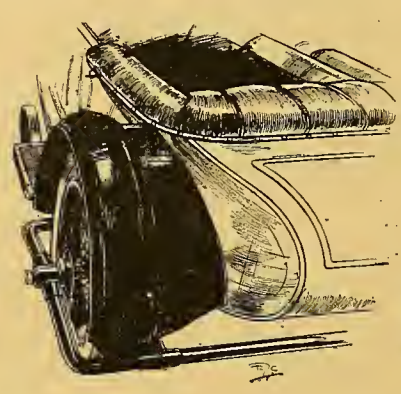
There was no end to the variety of screens this year, and amongst the neatest is the model on the Rex Acme; it is of good depth, which gives breathing space for the passenger. Another lightly and strongly made screen, attached to which is an apron, made from sheet rubber, was shown on the Velocette stand.

Of a quality thoroughly in keeping with the rest of the Triumph exhibits was the new sidecar in aluminium. It might be termed a semi-sporting type, though it has ample luggage space, and not the least of its merits is the ample mudguarding. An apron designed to embody a celluloid screen, and which extends also as a sidescreen, is a cleverly thought out job. On the big touring coach-built model a good-sized week-end bag can be accommodated.

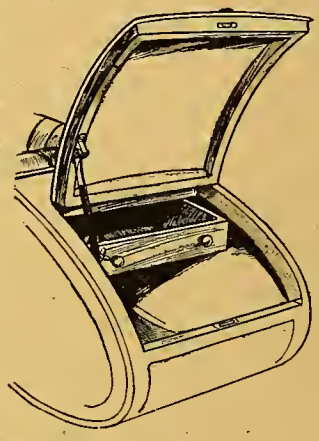
One could not pick out any striking innovation on the Sunbeam sidecar, yet it was a model that one could not pass by; inconspicuous and full of quality, the designers missed nothing in their endeavours after comfort for the rider. Several of the Sandum improvements were enumerated last week, but the folding semi-circular screen, designed for the rear passenger on the dual purpose model—or any two-seater for that matter—is a most ingenious device. When not in use it folds completely out of the way, and is locked with a special clip on the back rest of the front passenger—a thoroughly practical device that deserves as much publicity as it can get. To find a tandem seater which thoroughly screens both passengers is a rare thing. This device is one of many appertaining to sidecar comfort which exemplified the attention sidecar manufacturers are giving to devices which are likely to add to the comfort of the passenger.



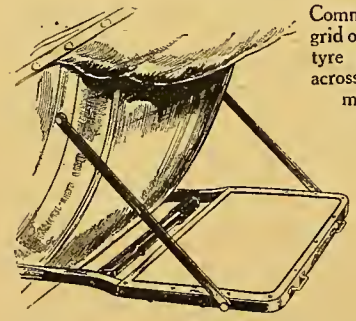
A useful locker on the Clyno sidecar.



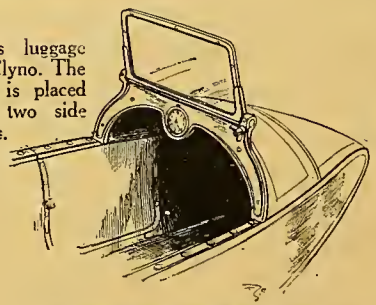
Improved wheel mudguarding on the new light touring Sunbeam sidecar.



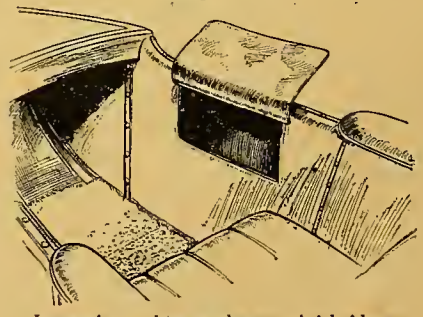
A useful little drawer for small tools is provided in the locker on the Blackburne sidecar.



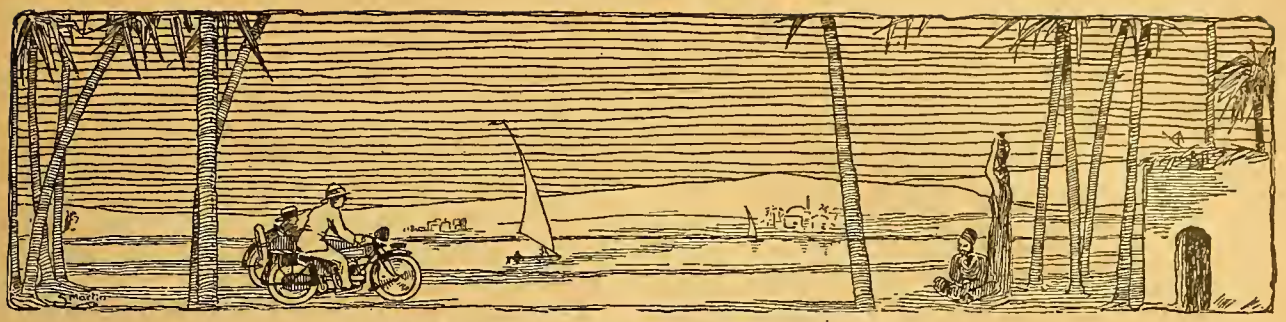
Commodious luggage grid on the Clyno. The tyre pump is placed across the two side members.



Cast aluminium instrument board on the Massey sidecar.



Large size pockets on the new Ariel sidecar.



IN THE NILE DELTA.

Exciting Road Conditions in Egypt. No troublesome Hills, but variations of Mud, Ruts and Dust

MOST people at home conjure up a vision of pyramids, palm-trees, and limitless sand when Egypt is mentioned, and, generally speaking, these are about all that the average tourist does see of Egypt.

Of course, the war largely increased the numbers at home who are now familiar with this country, but a thoughtful and romantic General Staff generally arranged matters so that all camps, etc., were amongst the sand and palm-trees (there were not enough pyramids to go round), so that even *they* received a somewhat similar impression.

Egyptian Road Making.

Egypt, modern Egypt that is, is really the Delta and nothing else. The roads in the immediate vicinity of the towns are very similar to those at home, but outside, although the main roads have a fair surface, they are made of the dried mud that is dredged out of the various canals, the "road" running along the embankment so formed. Consequently in winter they are hopeless, and it is practically an impossibility to keep upright on one's two feet. In the late summer also it is nearly as bad, for there is almost a foot of soft dust to negotiate.

Excluding Cairo and its environs, there are only four bridges—two over each arm of the Nile—in the Delta, consequently all roads diverge from these points. The bridges are all built to carry the railway, and have a small side-walk for ordinary traffic, over which a motor car can just pass with a few inches to spare. It requires careful driving for a quarter of a mile of this!

Leaving Zagazig (the writer's headquarters), the road follows the Delta Light Railway—to be exact, the railway follows the road, and the passengers jump on and off the train at their leisure (this latter very literally).

Through a Native Market.

In the villages, when the weekly market is being held, the procedure is necessarily slow, for the blast of the final trump will not disturb an Egyptian market crowd, and one has literally to cut one's way through the populace with hundreds of miserable, half-starved pariah dogs snapping at one's back tyre.

In Mit Ghamr, which is typical of the small provincial towns, the streets are very narrow and winding, and, the neighbouring buildings being comparatively high, one loses all sense of direction after a few minutes; enquiries made of the native policemen are never very exact or enlightening, and consequently half an hour may be lost in trying to find the bridge over the Nile, and it is not a bridge that would pass unnoticed in any part of the world!

From here it is only a short run to Tantah, and onwards it is an easy run to Kafr el Zayat, where the other branch of the Nile is crossed. Approaching the town, a dismount is necessary, because one crosses a small canal by a Delta Railway bridge, and there is nothing between the sleepers, whilst their distance apart is not conducive to comfort if one rides over them.

(Top) On the road to Damanhour.

(Left) The Mahmondieh canal near Alexandria.

(Right) An Egyptian fishing village.

In the Nile Delta.—

Having crossed the bridge, serious doubts arise as to whether one is really on the principal "main road" of Egypt or not, because it appears to be a sort of yard with outhouses on one side, stables on the other, and haystacks in the middle, with the usual accompaniment of cesspools, hens, dogs, donkeys, camels, and gamoos (Egyptian = buffaloes) all around.

Uninteresting but exciting.

Later the road becomes quite good but uninteresting as it follows the railway into Damanhour. The road leaves the railway at Damanhour and follows the Mahmondieh Canal. At Kafr-el-Dawar it is necessary to cross the canal by the swing bridge, which always seems to be "up" when one arrives. Soon after leaving this village the macadamised road, originally intended to reach Cairo, is met with. Thank goodness it never got any further, for now it is so covered with loose metal that it is impossible to avoid all the humps and bumps. Except for this piece of road, however, punctures are uncommon, as none of the animals are shod, and also there is very little vehicular traffic. Alexandria is easily reached from here.

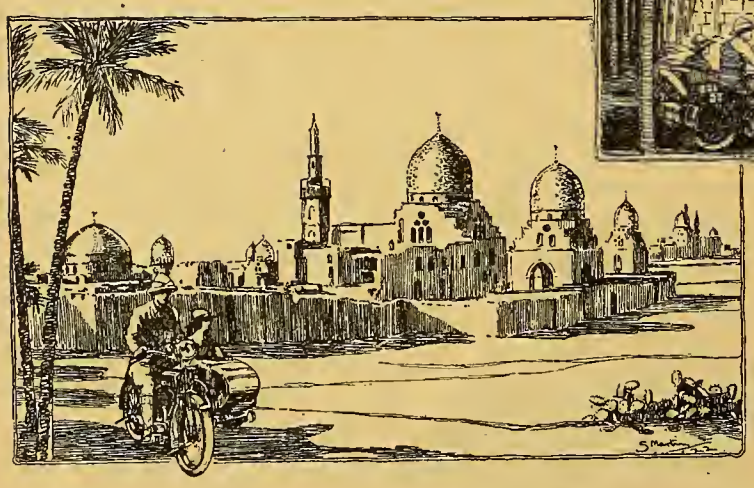
Another journey the writer has undertaken was to Sidi Salem, on the shores of Lake Borullos, mid-way between the two arms of the Nile.

The same road is covered to Damanhour, after which one turns sharp to the left for the Dessouk bridge. Under wet conditions the road surface is conducive to hair-raising skids with an inevitable tumble at the end of each.

The road from Dessouk to Kafr-el-Sheikh is worse, as there is heavy traffic on the road to the market. Without any exaggeration, there are ruts 8in. deep, not like those in English lanes, but all over the road.

Before reaching Kafr-el-Sheikh, one turns sharp to the left along the Nachart Drain bank, and from there is a straight line to Sidi Salem, where, when there is no rain, the dust is almost a foot deep, and it is very easy to fall into the canals on either side of the road.

T. W. E B.



(Left) Cairo has much of interest to the sightseer but probably the most famous place of historic interest is the Tombs of the Khalifs at the outskirts of the city. (Right) Although over two hundred miles from the Delta, the famous Pylon of Ptolemy Euergetes, cannot be out of place in any article on Egypt. This famous ruin is near the temple of Karnak, Luxor, the site of ancient Thebes, the capital of Egypt for 3,000 years. Remarkable discoveries were made there last week.

The sketches were actually made in Egypt and form an illuminating contrast with the author's description of conditions off the beaten path.

ENTRIES FOR THE LONDON-EXETER RUN.

ENTRIES for the M.C.C. London-Exeter Boxing Night run close definitely on Saturday (December 9th). Last year's entries amounted to 297, but this year the number may be less, as up to last week-end only a few more than half that number had been received. Entries will be accepted on Saturday up to the last post, addressed to the Trials Secretary, Mr. F. T. Bidlake, 84, North End Road, Golders Green, London, N.W.11. No provision whatever has been made for receiving entries after this date, nor is there any scheme for accepting entries at late fees. Of the 150 machines entered up to the present, there are 41 motor bicycles, 49 sidecar outfits, 4 three-wheeled cycle cars, and 56 cars.

The start of the run will take place, as usual, at Staines at 8 o'clock on Boxing Night, and again Peak Hill, near Sidmouth, will have to be climbed in the dark.

Better breakfast arrangements have been made at Exeter, so that no one will have to face the return journey without having had food.

Deviations from the normal return route will be made in order to include more severe hills than have formerly had to be negotiated, but the run remains essentially one which tests reliability and endurance rather than hill-climbing capacity.

Closer adherence to schedule time will be required than in previous Exeter runs.

WHAT INTERESTED ME.

Thoughts on Motor Cycle Design, Progress and Possibilities gathered on the Stands at Olympia.

By B. H. DAVIES.

The views expressed in this article are those of a technical journalist well-known in the motor cycle world from its earliest days. Comparison with the opinions of an ordinary motor cyclist as set forth on page 908 is interesting.

MONEY may be the root of all evil, but it was certainly the inspiration of a most excellent Show. The prices of sundry influential machines were jealously guarded secrets until the last minute, and their publication created a mild panic in factories which had done their 1923 budgeting with a more generous hand. The public rejoiced. The agents rejoiced. But those directors and technicians whose brains had not been concentrated on that elusive combination of quality and economy spent an extremely anxious day when the price cards began to go up. Anybody can build a low-priced machine to sell at a good profit, but only the supermen of the industry can give us good stuff at a low price and yet keep their shareholders in a good temper.

Nothing Sensational.

A few previous Shows have been rendered historic by the *début* of some epoch-making machine. Novelties were by no means scarce this year, but I did not see any exhibit which led me to hail the rise of a new genius among motor cycling engineers. I found nothing comparable to the sensations created by such machines as the Douglas, the Scott, and the A.B.C. at their first introduction. The four-speed G.S.D., however, is sensational in having an "ideal specification" as a material fact. On the other hand, it is quite clear that a new type of machine is emerging, and I would cite the 346 c.c. Triumph as the most prophetic of these pioneers. The standard "general purpose" solo machine of to-morrow will apparently have a 350 c.c. engine, unit gear box, possibly a gear primary drive, dynamo lighting, hub brakes, integral speedometer drive, and mechanical lubrication.

This specification includes many points for which all knowledgeable riders have been sighing these many years. It is already intensely attractive; and when more time has been lavished upon it, it should approach perfection. The designers were not demonstrating on any "350 c.c. unit" stand which I visited, and the attendants could not in any one instance explain why the unit principle had been adopted. They did not know whether it was cheaper than the two-item system (probably it is). They did not know whether it was quieter than the usual longish primary chain (possibly it can be made so). They did not know whether it keeps crankshaft and gearshafts more parallel (a short, stiff unit must be better on this score than two widely-spaced items in a light frame: and nobody wants a very heavy frame). Credit the single unit with lower production costs: with superior stiffness: and with the silence which such gears as the new Rudge four-speed box seems to possess:—then the unit is more than justified. Most of the units staged at Olympia were obviously a trifle immature. It is silly to employ two separate oil fillers when both engine and gear box use the same grade of oil. It is foolish to omit provision for verifying the tension of the primary chain—one primary chain actually permitted of no adjustment whatsoever. The units were seldom "clean." They offer a gorgeous chance for an absolutely symmetrical "barrel base." It would not matter if the bottom were a false bottom, a mere undershield, provided it were smooth and rounded; but several of the 1923 units will be harder to clean than many separate engines and gear boxes. Still, the principle is at last accepted *plus* the dynamo, and *plus* the mechanical oiling. With a little cleaning up of the exterior, a little stiffening of the rear frame, and a little re-designing of the drawbolts, we shall get a tidy machine with only one transmission adjustment, and that adjustment pinned down to permanent alignment. There were a great many units in the Show, and nearly all staged by big firms whose policy is deliberate and cautious—Triumph, Rover, Beardmore, and the like. I regard this innovation as the most important development of the year. It is—intentionally or accidentally—challenged by other 350 c.c. machines of at least equal eminence. To name a few, the A.J.S., B.S.A., and Matchless all fit separate gear boxes. Battle is joined: and the victor may not emerge in twelve months.

Position of the Miniatures.

The exact importance of the miniature motor cycle is remarkably difficult to gauge; I would as soon try to pick the winner of the 1924 Derby by studying the pedigree of the yearlings. To be offered a motor bicycle at less than £30 is most attractive. One remembers that in 1901 or thereabouts one paid £45 for an ostensibly similar machine with an inferior engine, an impossible transmission, and hardly any ignition or carburation to speak of; and that hardy, sporting youngsters solemnly toured all over the country on these ridiculous prototypes, pedalling, running and pushing up such hills as the machine would not climb under its own power. To-day, for 33 per cent. less money one gets an engine of, say, Villiers class, a Dunlop belt, a Burman two-speed box, dependable ignition, and a dependable carburetter. I am credibly assured that the Italian peasant dines very contentedly off spaghetti and macaroni. Would he do so if his next door neighbour were enjoying roast beef? When we oldsters rode the "1¾ h.p." Clement-Garrard or the "1½ h.p." Minerva twenty years ago, there were no Sunbeams or Nortons or Douglases. I *know* these new miniatures will do far more than their 1900-1902 forebears. I am not at all sure that most of the people who are expected to buy them won't squeeze their

What Interested Me.—

stockings or bully their bank managers and manage to run to something like the 349 c.c. B.S.A. Some of the miniatures were obviously very bad, and others as obviously very good: the two-speeded Omega Junior appealed to me as much as any of them.

For general utility runabout purposes, where speed is immaterial, there was nothing to touch the Harper. A genuine engineering job from stem to stern, embodying many brilliant details, its sheer unconventionality may hamper its progress. I fancy its first vogue will be for light delivery work with hard-headed commercial concerns who take strict account of costs. Then your genuine amateur—always a slow person to learn what is what—will come along. And, finally, all who want comfort and reliability *sans* sport—from the errand-boy to the country doctor, from Aunt Priscilla to Major Fitzhowitzer (retired—handicap 24 at Stoke Poges) will invest.

Weather Protection.

The Harper raises the big question of weather protection, at which several exhibitors are nibbling. No utility machine must land you at your destination looking as if you had rolled down Alms Hill on a wet day. No machine standardised more complete equipment than the Harper. Some had legshields. Some had muffs. Some had windscreens. My experience of weather protection is that you must have all—or none. With legshields and no windscreen, or windscreen and no muffs, I feel like a Polar explorer one of whose gloves has been mislaid in a blizzard, *i.e.*, I grow increasingly conscious of the naked part. Nothing covered the rider up *completely* except the I.O.M. outfit; but it was possible to rig up an assorted outfit from other stands, say, H.T. legshields, John Bull muffs, Easting apron and screen, etc.

A long, glad farewell to the stirrup brake; and a special putty medal to one designer, who, being compelled by other causes to re-draft his front fork, specially designed *a new stirrup brake* for it.

All motor cyclists owe much to the Triumph Co. They have put us under fresh obligations by standardising dynamo lighting. A bold lead, which will surely be widely followed, and will help electric firms to pare down their stupendous prices. In appraising Triumph prices, remember that they include an electric outfit listed at £22 odd retail.

Silencers.

I frankly dislike the new fashion of mounting the silencer on the off-side chain stay. It adds a needless and blobby excrescence to a layout which can never be too "clean" in its lines. The obvious advantages are that it is easily taken off (in localities where the police are tolerant) and is less liable to get encrusted with mud. But everybody has the wind up about noisy exhausts. The designer of a 976 c.c. twin boasted to me that his exhaust system had a capacity of 3,400 c.c., but I had just been looking at the P. and P., which boasts two chambers and a stove pipe totalling 5,000 c.c. for its 350 c.c. engine.

Mechanical lubrication is coming fast, but has not yet boomed. The neatest installations naturally occurred in units and on engines designed to embody a pump. For neat fitting of proprietary pumps commend me to the Best on the Barr and Stroud, or to the Showell on the Martinsyde (wholly enclosed inside the magneto chain case). The absence of mechanical oiling was the one and only blot on our big British twins. At last we have got America panting, both for masculine virility and feminine beauty. The shapely glitter of the Brough Superior and the rich, dark style of the big Zenith were respectively unsurpassable. The frame of the latter is worth close study. Le Vack has only used one frame on Brooklands both for solo and sidecar work: and I hear it is still true and sound.

32 h.p. from 350 c.c.

We shall wait anxiously to prove what the new model engines are like on the road. I hear on the best authority that the Douglas people have coaxed 32 b.h.p. on the bench out of a special stunt edition of their 350 c.c. That is equal to 137 b.h.p. out of a 1½-litre car racer!

Impoverishment has practically banished the "posh" sidecar, most of the exhibits being workmanlike rather than ornate. Despite alarmist rumours, the best cycle cars are doing as well as ever. The Morgan stand was only semi-approachable. The T.B. people seemed very happy, and the Scott Sociable reaped the benefit of a price cut not far short of £40.

Turning to smaller items, it was delightful to see two such leaders of fashion as Triumph and Rudge using a *designed* speedometer drive; and the latter firm's "top of the tank" toolbox is as good as their new double-helical gears are quiet. The Scott three-speed gear box will popularise this famous machine in its sidecar form. Steering head lubrication is at last catered for on at least a dozen makes; 3½in. tyres are quite common on big twins, and 3in. tyres are obtainable on most 500 c.c. singles. Spring frames are few, and the growing popularity of the 350 c.c. machine will soon lead to a demand for an increase in its comfort. Shall we see 3in. tyres extended to it in 1923-4?

Steps in the Right Direction.

Completely encased mechanism is rare. The P. and P. does the job very nicely. So does the Harper, and the H.T. has ideas in the same direction. But most "engine rooms" are neither encased nor smoothed over. In the way of small gadgets, the Lamplugh "two level" petrol tap was probably the best thing in the Show, and can easily be fitted to any standard machine.

Of course, all the interesting things at the Show were not of a mechanical nature. Crowds always intrigue me, and an Olympian crowd particularly. The old lady who asked for a suitable sidecar for the McKenzie miniature, for instance; or the breeched lady members of pedal cycling clubs who passed by the most alluring sidecars with something approaching disdain; or the two schoolboys who were more fascinated by the presence of George Dance, himself, than by all the glittering Sunbeam exhibit.

On the whole, a great Show with economical motor cycling as its keynote, but full of sound tendencies, all rather hampered by that cautiousness in design which is a mark of profound wisdom in a period of lean finance.

QUALITY UNALTERED.

Not the slightest alteration to the quality of the material has been made; a degree of sturdiness, dependability and long life has been aimed at altogether beyond the general light car standard. For refinement of design, detail work and finish the G.N. at its new price has no rival.

Send for the G.N. Catalogue.

Do you use Benzole?

When using Benzole it is advisable to drain the engine sump rather sooner than when Petrol is used.

THE grades of Wakefield Castrol recommended for use with Petrol engines are equally efficient for engines which use Benzole or a mixture of Petrol and Benzole. This has been proved in such searching tests as the successful R.A.C. Benzole Trial when a Rolls-Royce car (lubricated with Wakefield Castrol) tested the efficiency of Benzole over a distance of 10,000 miles.

CORRECTION.

It is regretted that, owing to a Printer's error, the price of the

O.H.V. 3½ h.p. NORTON

was stated in last week's issue of "*The Motor Cycle*" to be £78. This should have been

£98.

The Editor does not hold himself responsible for the opinions of his correspondents.

Correspondence should be addressed to the Editor, "The Motor Cycle," Dorset House, Tudor Street, E.C.4, and must be accompanied by the writer's name and address.

BENEFITS OF RESEARCH WORK.

Sir,—As inventor and joint patentee of the brake described in your issue of the 16th ult., I appreciate your enterprise in giving it early publicity, but as Director of Research of the British Motor Cycle and Cycle Car Research Association, I beg leave to traverse, with all the emphasis consistent with courtesy, the statement that this brake is "the first practical evidence of the activities of the Research Association."

The brake in question was devised before the research work on the subject had begun, but as the results of the experiments became available, they confirmed fully and thoroughly the advantages and properties of the design, and these have been further confirmed in road tests.

My object is to bring into prominence the view that inventions and patents, however useful, are but a very small part of the rich harvest to be reaped by the methods of scientific research. H. S. ROWELL.

[The announcement of the brake design referred to was the first notification of any device or experiment to reach us from the Research Association.—ED.]

HUMIDITY AND POWER OUTPUT.

Sir,—In the discussion regarding "Humidity and Power Output" apparently the simple fact that dry atmosphere contains a greater proportion of *air* than moist atmosphere has been disregarded. The average motor cycle carburetter is adjusted to give a reasonable performance consistent with economy, and it follows that, if for a given volume of atmosphere induced less *air* is present, the resultant slightly richer mixture must improve that performance.

F. KEYS.

Sir,—My remarks having aroused criticism, I hasten to reply thereto.

By his "nom(bre)-de-plume" I recognise "49,867" as a departmental confrère. It is gratifying to note that he partially agrees with my view.

As to super-Rudging I can assure him and Mr. Andrews that it is neither provoked by imagination nor a species of D.T.'s as "Macbnus" suggests. On a gear of 3 or 4 to 1 an increase in engine revolutions is most noticeable. The speed-burst may last for a mile or more followed by a spell of normal running—this without alteration of controls or personal lubrication!

May I recommend Mr. Andrews to peruse my previous letter again. I fail to see how I suggest therein that water-vapour increases the density of the air—this point is precisely my bone of contention with "M.B.B.H." He also states that I appear to think the density of the atmosphere varies only with pressure. Has he noted my remark that the cold air in the valley must be slightly heavier (or denser) than the warmer air on the hill-tops? Surely an effect of temperature on the density of the air, explained, for Mr. Andrew's benefit, by terrestrial radiation. His statements are mainly a reiteration of my own.

"Research the carburetter" in his letter has my partial support, and I look forward to informative and not controversial replies to his queries. P. F. JARROLD.

HARDIER NORTHERNERS?

Sir,—Whence this undeserved laudation of the "hardier Northerners"?

Do we not remember the recent A.C.U. Six Days Trials wherein three of these Northerners, riding machines made up amongst the "rough stuff" and famed for stability, were afraid to take a sporting chance on a little pimple down south that even I (a mere Southerner) have often climbed on a baby sidecar outfit? UNCONVINCED.

Oxford.

Sir,—Oh, what an amiable sort of fellow "Southerner" must be! We surly hogs of the North think he is most fortunately situated just where he is—down south. He seems to have a marvellous capacity for turning a friendly jest into a most outrageous insult. I should advise him to procure a waterproof cover for his little sailor hat, as some of the rain in which he so evidently enjoys riding seems to have penetrated to his brain. BN 4518

Lancaster.

Sir,—So the hot blood of the Southerner is again aroused by the worthy comments of the "Lancashire Lad" with regard to the respective merits of the Northern and Southern rider.

Ah, well! Was there ever a page in history when absolute agreement was reached between the denizens of the hills and plains? I think not. And now the old, old question is again reaped up, only this time with additions regarding the manners of the Northerner.

I am indeed desolated to think of the low opinion held for us by your worthy correspondent of the great metropolis who rides his single-geared two-stroke on the Bath Road and the "Street" after dark, and who, I fancy, is mistaking manners for diplomacy.

If this is the case, I am in perfect agreement with him. The people of the North are (I regret to say it) not diplomatic. They are too abrupt. They have forgotten the old adage that a soft answer turneth away wrath, and they say just what they think. If their parlour tricks are not all that they should be, it is because of the fact that they spend most of their time in the saddle. In any case, their hearts are in the right place, and I am sure that none of them bear "Southerner" the slightest grudge for expressing *his* opinion. At least, they will not take it as an "insult."

With Mr. A. E. Jessop I can deeply sympathise. Being a secretary to a motor club, his thoughts are bound to be soured to a certain extent, but in any case, his geography is quite wrong. He speaks of the North as being the centre of the motor cycle industry, yet unless Birmingham, Wolverhampton, and Coventry have shifted their moorings lately, I have an idea that they are situated in the Midlands.

True, the Scott, the P. and M., and one or two others are natives of the North, but they form a very minute proportion of the motor cycle output, and I *have* heard of machines being made in very close proximity to London.

Again, with regard to our professing to enjoy bad roads, slag heaps, and the like, be that far from his mind. We

do not like them; they are merely a portion of the burdens we are compelled to bear, and we bear them as cheerfully as possible because of the delights which lie beyond.

But only in the industrial North are the eyesores to be found. In the real country (by which I mean anything North of Bradford and Leeds, and this is the district which I conclude to be indicated by "Ixion"), one will find the motor cyclist who delights in hills, cart-tracks, river-beds and the like, who does not take them because he is forced, but in a real spirit of discovery, in an attempt to find a piece of ground over which his machine will not take him —the man who turns the bows of his 'bus still further North, and who cannot bear to see a road snaking up the side of a precipice without attempting the climb.

Skipton. PARK-RASH.

Sir,—I read with much amusement the letters from the various injured Southerners which are the result of "Ixion's" (knowing old cuss) proposal that riders in the North are hardier than Southerners.

To put it plainly, it is, to my mind, a matter of practice or custom. Your Southerner has to ride at a grandfatherly speed on billiard table roads, owing to the efforts of the misguided set of nurses in blue uniform. On the other hand, the Northerner is more often far from the madding crowd (in blue).

Further, the Northerner is able to practise over rough surfaces, and so gets much more proficient than his Southern brothers; consequently, the hill or boulder-strewn surface which would dismay the Southerner would be calmly attempted by the other.

I sympathise with Mr. A. E. Jessop regarding the super-tuned policemen, and it will perhaps be a consolation to him to know that during a late motor show a party of simple Northerners went through a well-known police trap at speed, to experience the thrill of such sport; and, being simple people from the country, they were not in full possession of the rules of the game, and so did not stop to expose their birth-marks, etc., or as otherwise thought fit.

It is not a new experience to me to hear complaints after a Northern trial from Southern riders to the effect that the course has been "real murder." G. R. SYLVESTER.

Sir,—After the "Southern offensive" against "Ixion's" remarks in a recent issue I must say a few words in his support. As a Midlander now residing in the North I have sampled roads in most parts of the country on various types of machines and under varied conditions. His remark about "floundering over pot-holed setts and petrified kidneys" comes home to me very much at this time, which is my first winter up North for many years. He also forgets those steel skid-producers which some people use for running tramcars along. Though I have slithered about the wood setts in the heart of London and of Birmingham on fixed geared "90 bores" and sampled the greasy lanes and frost-covered tarmac of most counties in England for about fifteen years, there is one type of journey I have not yet raised the slightest enthusiasm for—even on a machine very near my ideal for ease of handling and steadiness (a standard Brough Superior)—that is, setting off for a night ride in foggy November drizzle over a road which has about forty solid miles of pot-holey cobbles and tramlines, through Lancashire traffic, with a pretty fair chance of landing under an umpteen-ton steam waggon if you fall at the wrong time! No, one only has to ride for a short time up here to say that the all-weather solo rider in Lancashire is a very "stout fellow"—it's a very different thing to pottering back from the "Hut" on a little two-stroke.

Oldham. BENUROW.

COMBINED PRIMARY AND IGNITION DRIVE.

Sir,—I should like to know, through the pages of your valued paper, the opinion of other motor cyclists on the design of a certain machine at the Olympia Show, in which the power of the engine passes to the gear box *via* the armature spindle of an M.L. ignition and lighting unit. The entire load is borne on this spindle as it is placed between the engine and gear box, on the *driving* side of the chain, therefore becoming the fulcrum, the engine being the power and the gear box representing the load. "MURCLUF."

London, E.10.

RECORDS BY PRIVATE OWNERS.

Sir,—I should like to suggest that next season records might be set up at Brooklands by private owners; I am sure that it would arouse a great deal of interest, as it would show what a standard machine can do in the hands of people who are in no way connected with the trade. PRIVATE OWNER B.M.C.R.C.

London, E.C.2.

HOW TO CLIMB ALT-Y-BADY

Sir,—Judging from his letter, Mr. Wills has misunderstood my letter on Alt-y-Bady.

I certainly did not mean to imply that Mr. Wills was throwing away any chances of making a clean climb by taking the hill in second gear in last year's Reliance Cup Trial. I have seen Mr. Wills climbing Alt-y-Bady and other hills far too often to infer anything of the sort.

What I meant to imply was that the only way for the *average rider* to climb Alt-y-Bady was by taking the hill as slowly as possible on a low gear ratio. As a matter of fact I distinctly remember hearing Mr. Wills himself say that Alt-y-Bady was not really difficult *if taken slowly on a low gear*; and this was what I meant to be the main point of my letter. I. WALTER BEVERS.

SEMI-SOLID TYRES.

Sir,—I have read the leaderette on "Solid Tyres on Touring Machines," in which you say "The difference in the 'bounce' of the former (pneumatic) and the dead thud of the latter conveys its own story." There is very little more difference here than there is between the bounce of a "Sorbo" unburstable ball and a piece of solid rubber.

The former consists of a rubber casing filled with a sponge-like rubber substance, and is an extremely "lively" type of bouncing ball. A motor cycle tube filled with the same substance should provide a tyre quite as resilient as the pneumatic tyre at present in use, if not more so.

I am convinced that, with a little experiment in this direction, an efficient motor cycle tyre could be produced.

Worcester. "SORBIST."

[Sorbo pedal cycle tyres are already made.—ED.]

FIRST TO CLIMB SKIDDAW.

Sir,—Mr. Rutherford (in his "Observations from the North-West") says that not long ago he saw a report in which a rider claimed to have made the first ascent of Skiddaw. If Mr. Rutherford can produce that statement I will contradict it, but I think that if he takes the trouble to read it instead of casting it aside with contempt he will find that the report says, "We think we are right in saying that this is the first time that Skiddaw has been climbed with a sidecar and passenger."

He will note from the report that my machine was a 498 c.c. Zenith-Bradshaw with a bottom gear of 16½ to 1—not so low when you consider that some of the 750 c.c. machines used a 25 to 1 in this year's English Six Days Trials. Mr. Rutherford then says the ascent was made quite recently by T. B. Westmoreland, R. Drinkall, W. B. Little and R. Braithwaite, all on single-geared machines. I suppose he can prove his statements, but in any case I ask him to make an appointment with me at Keswick any Sunday, when he can produce the machine and rider to prove what he says. As this time of the year is ideal for proving the efficiency of fixed-geared machines, "Oh, let it be soon!"

Being a member of clubs affiliated to the Northern Centre and the North-Western Centre A.C.U., I competed in the North-Western Centre Championship Trial this year, but the Northern Centre Championship Trial was cancelled through insufficient entries. Perhaps most of the riders were on picnicing jaunts.

Wrynose, Blae Tarn, etc., are not comparable with Skiddaw for gradient or surface, which can easily be proved.

In closing I hope that Messrs. Westmoreland, Drinkall, Little and Braithwaite will accept my apologies for being brought into this matter. I am not belittling their riding capabilities; I am only challenging Mr. Rutherford's statement. A. JEPSON.

GEARS OF 1912.

Sir,—"Ixion" alludes to hub gears as imitation alarm clocks, etc.

The hub gear led up to the box gear, which is a vast improvement, of course, but in its day we were very glad of the former. I don't know if "Ixion" ever had any experience with one, and could not get on with it. Maybe. Anyway, its chief fault was that it needed a little ordinary intelligence to keep it in trim. It was not, like the present-day gear box, practically fool-proof.

I have ridden thousands of miles with both the Sturmey-Archer and Armstrong, and had no particular trouble until they wore out, and I have heard say that even the present gears sometimes do that.

I can mention a much worse terror than a hub gear. Does "Ixion" remember the old "Benz"—I almost forget how to spell it now—car with its series of belt gears like the overhead shafting of an engineers' shop? "AN OLD 'UN."

Leicester.

Sir,—I am the proud, also impecunious, possessor of a 10-year-old Triumph, and to have this spoken of and compared to the mind of a Kaffir in this manner touches me to the raw.

Comparisons are indeed odious! True, there are vast improvements in the present models, but "my imitation alarm clock fixed in the back wheel" does not need the treatment "Ixion" prescribes. I give it a spot of oil every 2,000 miles or so, and that is all. Adjustment is not necessary save when taking out the back wheel, which I admit is a nuisance, but only occurs rarely; and gear changing is as easy as falling off a log. Silent and sure at any speed. And I have obtained 54 m.p.h. ont of this 10-year-old. And all the other component parts of this machine fall into line, to make it indeed a non-trouble 'bus.

I have just completed a 1,000-mile 8-day tour of Devonshire and South Coast from the Midlands—and never once touched a spanner. (Kaffir, indeed!) This would be quite a creditable performance for a 1922 'bus; and I am extremely doubtful if some of the 1922 makes will still be going in 1932 as well as my trusty Triumph does at the present day. I quite expect mine will even then be still emulating Johnny Walker and going strong! B.C.1499.

Leicester.

ABROAD ON AN AMERICAN MACHINE.

Sir,—From time to time one sees letters in which readers describe their experiences with various machines. These usually deal with English motor cycles ridden in England, and it may be of interest to know of the behaviour of an electrically-equipped Indian Scout in one of the Colonies.

Judging from what I have read, the word "colony" conjures up visions of frightful roads, abounding in potholes and young rocks, in the mind of the average motorist in England, so before I give an account of my experiences with the Scout, let me say that this little colony of Hong Kong boasts of roads with a magnificent surface. Indeed, it is a motorists' Paradise in miniature, the only drawback lying in the constant hill-climbing, many of these climbs being two miles in length.

During the months of May, June, and July of this year I rode a second-hand 1921 Indian Scout, taken over when it had done about 2,000 miles. In this period I covered 1,900 miles, more than a thousand of which were with a pillion passenger, and particulars of this mileage are here given :—

Petrol consumed : 23 gallons (82 m.p.g.)
Oil consumed : 1½ gallons (1,260 m.p.g.).
Highest speed attained : 54 m.p.h. (with two up).

The machine had plenty of power and excellent acceleration.

Troubles enconntered were as follows :—

Kickstarter.—The method of attachment was not sufficiently sturdy, as on all Scouts of 1920 and 1921. I think I am perfectly safe in saying this, because every Scout rider in Hong Kong has experienced the same trouble, more or less.

Clutch.—Trouble with this was due to the previous owner's harsh driving and lack of attention, as he omitted to oil the gear box as often as was required. Filing the clutch plates to a perfectly even surface and regular oiling remedied the defect.

Electric Equipment.—This gave trouble twice, again due to the first owner's carelessness. A mysterious short occurred in the battery box; this was easily cured. The generator then refused to charge. The fault was thought to be due to a defect in the wiring, but as changing it produced no difference the generator itself was attended to. The trouble was then found to be pitted platinum points. When these were filed down the generator regained its former efficiency.

Points which might be improved are the angle of the footrests, the ground clearance, and the method of chain protection. A chain-case like that fitted on the 1922 Harley flat twin, with the same system of chain-oiling, would be very desirable.

I have not ridden a medium-weight to beat the Indian Scout for ease of cornering, power, and all-round efficiency, coupled with remarkable silence, though there are one or two which are more comfortable and slightly smoother-running. LEO. D'ALMADA, Jr.

Hong Kong.

SILENT MACHINES OF LONG AGO.

Sir,—Eagerly we have awaited a fitting reply to "M.D.'s" amazing display of general "knowledge" in *The Motor Cycle* of October 19th. "M.D.'s" proof that the fitting of a silencer not only does not increase but actually decreases back pressure is too funny to be allowed to pass unnoticed.

Because the uncovering of a hole drilled in his exhaust pipe, two inches from the port, made his machine run worse than it did with this hole covered, *therefore* the fitting of a silencer (he does not specify any type) will actually improve the running of any machine. "So much for loss of power through an exhaust box," he says, and settles the whole question for ever—but perhaps only to his own satisfaction.

Does he fail to comprehend that the uncovering of such a hole would disturb the whole exhaust system, minimising the "extractor" effect of a straight-through pipe and causing innumerable eddies and other frictional disturbances in *any* exhaust system? I have omitted the fact that, were the hole in front, there would be a *direct* air current tending to prevent the exit of the exhaust gases, because even "M.D." might have realised this.

I would not exchange my 490 c.c. Norton for fifty 2⅛ h.p. Clement-Garrards, however many decades the Norton may be behind the C.-G. in design.

Where would "M.D." *like* his engine? Carried in a separate vehicle?

London, S.W.9. NUISANCE (*né* KNUT).

SECONDS COUNT, even in long distance records, and the method of filling the oil-tank of J. H. Mather's record-breaking Rudge shows that this rider has realised the fact.

THREE-SPEED SCOTT SQUIRRELS.

Sir,—As an admirer of the Scott Squirrel, though not an owner, may I ask why the three-speed gear box fitted to the standard Scott for 1923 is not fitted to the Squirrel model also? It seems to me that this would even further improve this already admirable machine. ALLAN HARTLEY.

H.P. OR FUEL TAX?

Sir,—It is evident from matter appearing in your correspondence columns that there are motor cyclists who fail to realise that a fuel tax would be a *fair* method of taxation, in so far that the contribution from each vehicle would be proportional to road usage.

I do not agree with "XR 3296" when he remarks that because a man buys a motor cycle for *pleasure*, he should be taxed. The Chancellor of the Exchequer does not intend it to be a "pleasure" tax, otherwise the man who spends £100 on a billiard table, for pleasure, should be in the same category. Why not a £10 tax on all beer drinkers, irrespective of the quantity of beverage consumed by the individual? Just as logical, isn't it! A. C. GILLMAN.

INTEREST ON EASY PAYMENTS.

Sir,—We were somewhat surprised at the contentions of "Not Likely," on the easy payment question.

For many years we have conducted our own deferred payments, and all we charge is 4 per cent. on the total sum, or 5 per cent. on the balance, and we have always had a system of discounts when account has been paid in two, four and six months, and we have just increased this to nine months. In addition, we have not insisted, as a great many firms do, on the client insuring the machine, although we advise everyone that it is the proper course to adopt.

The risks of easy payment business, and the costs of running, are very considerable. We speak from experience, our contention being that if this system was not in vogue there would be far fewer motorists on the road.

The above calculations, we think you will find, work out at 5 per cent. on the balance, $8\frac{3}{4}$ per cent. per annum, or 4 per cent on the total sum, 9 per cent. per annum, the figures being calculated on the basis of one quarter down and the balance in 12 monthly instalments.

R. RICHARDSON,
Secretary for LAMBS, LTD.

Sir,—We were intensely amused at "Not Likely's" letter, always assuming (as we must assume, since, so far as we are aware, we are the only firm advertising these figures) that his remarks refer to the Tripp Lightweight.

We have always had a very high opinion of the nerve displayed by most of the motor cycling fraternity, but we can hardly appreciate it when exhibited in this new form. Surely ordinary courtesy would demand that one makes as sure as possible of the facts before rushing into print, even under the cloak of anonymity.

The fallacy in "Not Likely's" letter is that while £24 3s. buys a Tripp motor cycle only, the deferred payment terms, amounting in all to £27 10s., buy a Tripp motor cycle, *plus* a full insurance policy for twelve months, and include interest charges at the rate of 1s. 10d. per month. Your commercial readers will, no doubt, see at a glance what an enormous profit this monthly figure produces after meeting the overhead charges of receiving, recording, banking, and acknowledging receipt of a large remittance like £1 17s. 6d.

Perhaps "Not Likely" will oblige with another of his lightning calculations and tell us how we do it?

J. K. CARRUTH,
Managing Director,
THE TRIPP CYCLE CO., LTD.

PILLION RIDING IN SAFETY.

Sir,—Considerable experience of pillion riding has convinced me that the best method, from the driver's point of view anyhow, is when the passenger sits side-saddle on an ordinary strapped-on cushion, *and not on a sprung pillion seat.* Whether the majority of passengers agree is another matter. NOAH.

London, N.W.8.

Sir,—I quite agree with "A.B.C." that side saddle is the best and safest style of pillion riding. I have done scores of miles with my wife up on my Allon, and if we come to a stiff hill she can just slide off and walk on to the top without my stopping the machine. C. H. HILL.

Wiveliscombe.

Sir,—If Mr. Killingbeck will make a trial of an ordinary saddle fixed to the carrier on a motor bicycle he will soon find out why this shape is not suitable. In order to clear various obstructions, such as the carrier and driver, the passenger's knees have to be considerably wider apart than those of the driver, which fact alone makes an ordinary saddle rather uncomfortable.

We agree, of course, that the ordinary pillion seat is not suitable for astride riding, and have conducted very many experiments with a view to evolving the best seat for the

J. SHELLY,
Manager, SAXESSORIES, LTD.

Sir,—Your correspondent, "A.B.C.," expresses rather amusing views when he says that in emergencies a side-saddle passenger of a motor cycle can alight, and thus only the rider may come to grief. Has it occurred to "A.B.C." that alighting from a machine travelling at speed is much harder than it seems? Besides, it would upset the balance of the motor cycle and thus probably bring about an accident which might otherwise have been avoided.

"A.B.C." has touched 58 m.p.h. with his passenger-seated side-saddle, and, in my opinion, had an emergency then arisen, the passenger would have been just as badly hurt through jumping off as by hanging on.

In the course of the last six years I have covered about 20,000 miles with tandem passengers, who have always been seated astride, with feet resting on firmly-fixed footrests. I find I can attain higher speeds with a passenger than without, as the additional weight makes for steadiness.

In all, I have had about half-a-dozen crashes, and only in one of these was I carrying a passenger. This happened in Hong Kong, China, and may interest your readers. The doubting Thomases will, no doubt, ridicule me, but I have eye-witnesses.

Three of us were speeding along on a fine stretch of roadway skirting the sea, when the leader got speed wobble at about 45 m.p.h. He crashed just ahead of me. I had no alternative but to ride over his machine, yelling to my passenger to hang on. Unfortunately, the Tan-Sad he hung on to was not firmly fixed to the carrier (which was not tubular), and so, when we bumped, Tan-Sad and passenger went sailing into the air, to land, after a couple of somersaults, in the sea! The miracle of it is that I was not unseated, and continued for a few yards before coming to a stop. I think I rode over the back stand and rear wheel of the other machine. "KOWLOON HARLEY."

London, E.C.2.

Books & Maps for Motor Cyclists.

Issued in conjunction with *The Motor Cycle.*

"MOTOR CYCLES AND HOW TO MANAGE THEM."
The standard handbook of the motor cycle.
Price net, 2/6. By post, 2/10.

"TWO-STROKE MOTOR CYCLES."
Second Edition. Just Published.
Price net, 2/6. By post, 2/9.

"HINTS AND TIPS FOR MOTOR CYCLISTS."
Eighth Edition. Price net, 2/-. By post, 2/3.

"TRACING MOTOR CYCLE TROUBLES."
Fifth Edition. Just Published. Price net, 2/-. By post, 2/3.

"MOTOR CYCLE REMINISCENCES."
By "IXION," of *The Motor Cycle.*
Cloth Bound. Price, 5/-. By post, 5/3.
Paper Boards. Price, 2/6. By post, 2/9.

"THE MOTOR CYCLE" ROAD MAPS.
Set of Three Maps—England and Wales, Scotland, London. Set of three, complete in case. Price net, 5/6. Book post, 5/10. Set of Two Maps—England and Wales, London. Price net, 4/6. By post, 4/8.

"THE MOTOR CYCLE" ROUTE BOOK.
With 32 pages of Road Maps. Price net, 2/6. By post, 2/10.

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., Dorset House, Tudor Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls.

CURRENT CHAT (continued from p. 887)

Flying Motor Cyclists.

In France a club has been formed to encourage motor gliding.

After the Club Dinner.

Seen on the Birmingham-Warwick road: A leather-clad, be-helmetted and be-goggled speedman vainly attempting to inflate one of the security bolts of his Norton.

Organisation of Paris-Nice Trial.

Next year's Paris-Nice trial will be held in the middle of February. The whole control will be in the hands of M. Bonnet, 102, Rue de Charonne, Paris, the general secretary of the *Motocycle Club de France*.

A New Era!

Among the novelties of the Show, as discovered by a Sunday newspaper, were a "£25 cycle and sidecar for the family" and a "machine capable of pulling out to 200 m.p.h." Certainly (still quoting from the same source) "Olympia presents the vision of a new era."

Road Improvements.

In connection with the proposed British Empire Exhibition numerous road improvements are being made in the neighbourhood of Wembley Park, Kingsbury, and Neasden.

Where the Ford Shines.

That the most efficient car headlamps are not always the most dazzling is proved by the fact that motor cyclists often complain that Ford cars are the worst offenders of all.

Sleeve Valves for India.

"Push the sleeve valve engine for all you are worth," says a correspondent in India. "It is *the* engine for the East."

New Officers of the A.A.

Owing to his appointment as a member of H.M. Government, Sir William Joynson-Hicks, Bt., M.P., D.L., has had to tender his resignation as Chairman of the A.A. and M.U. Lt.-Col. Charles Jarrott, O.B.E., who for a long time occupied the post of Chairman of the Motor Cycling Club, has been elected to fill the vacant position. Lt.-Col. Sir Walter Gibbons, K.B.E., D.L., and the late Hon. Treasurer, Mr. Charles McWhirter, will be Vice-Chairmen, and Mr. W. Ballin Hinde fills the post of Hon. Treasurer.

A "Sporting" Sidecar.

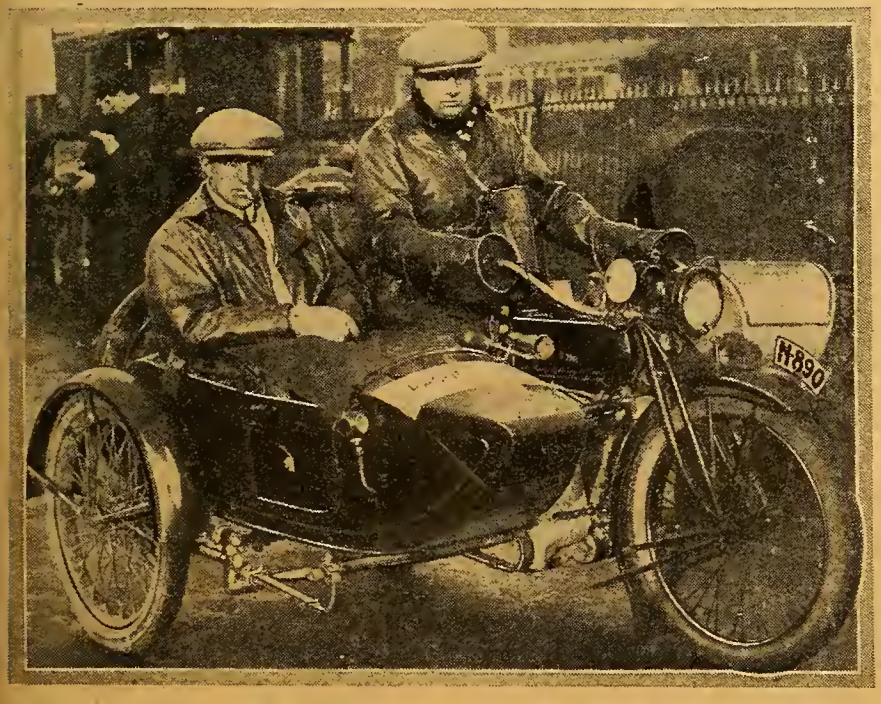
A new use for the sidecar—and its "silencer"—is described by an Australian contributor to *The Field* this week. In a reference to the shooting of bush fowl he writes:—"In this district the bush fowl usually lie up near the road in the evening, and on one occasion, when we had nothing to do, my boss suggested that he should drive up the road with me in the sidecar armed with a 12-bore, trusting that the noise of the motor would put the birds up. . . . We saw only a brace; the first got up about fifteen yards away and rather in front (we were doing about twelve miles an hour), and I missed him. Another got up in the same place, so I swung round in the sidecar and loosed off the choke, and down he came."

Exclusively Social.

The newly-formed Wigan M.C.C. caters for sidecarists only.

Essential Spares.

A correspondent in the East sends a long list of spares and equipment which he deems it wise to carry. After enumerating them all, one by one, he concludes, "and lastly, an orderly, who can help with repairs."



ESTABLISHING A NEW RECORD. This driver and passenger rode from Prague, Czecho-Slovakia, a distance of nearly 1,000 miles, in order to visit Olympia. Such enthusiasm would be hard to beat even among British riders.

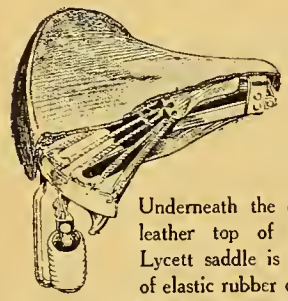
Next Year's Competition Programme.

Provisional dates for various important and open competitions during 1923 have now been arranged as follows:—

Sat., Feb. 24th—Colmore Cup Trial.
Wed., Mar. 14th—A.C.U. Stock Machine Trial.
Sat., Mar. 17th—Victory Cup Trial.
Sat., Mar. 24th—Essex M.C. Hill Climb.
Easter Monday, April 2nd—Northern Centre Hill Climb.
Sat., April 7th—Western Centre Reliability Trial.
Sat., April 14th—Wessex Centre Speed Trials.
Sat., April 21st—Eastern Centre Reliability Trial.
Sat., April 28th—North-Eastern Centre Reliability Trial.
Sat., May 5th—South Midland Centre Speed Trials or Hill Climb.
Sat., May 12th—Midland Centre Reliability Trial or Hill Climb.
Fri., May 18th-19th—M.C.C. London-Edinburgh Run.
Whit-Monday, May 21st—North London M.C.C. London Rally.
Sat., May 26th—Northern Centre Reliability Trial.
Mon., June 11th—Junior T.T. Race.
Wed., June 13th—Lightweight and Sidecar T.T. Races.
Fri., June 15th—Senior T.T. Race.
Sat., June 23rd—M.C.C. Team Trial for "The Motor Cycle" Cup.
Sat., June 23rd—South-Western Centre Reliability Trial.
Sat., June 30th—Yorkshire Centre Reliability Trial.
Sat., June 30th—East South Wales Centre Speed Trials.
Thurs., July 5th—Eastern Centre Speed Trials.
Sat., July 7th—Midland Centre Reliability Trial.
Sat., July 14th—South-Eastern Centre Reliability Trial.
Sat., July 21st—B.M.C.R.C. 500 Miles Race.
Sat., July 21st—North-Western Centre Trial.
Sat., July 21st—Yorkshire Centre Speed Trials.
Sat., July 28th—North Wales Centre Reliability Trial.
Sat., Aug. 4th—East Midland Centre Speed Trials.
Mon., Aug. 6th—West-South Wales Centre Speed Trials.
Wed., Aug. 29th, to Wed., Sept. 5th—A.C.U. Six Days Trials.
Sat., Oct. 13th—East Midland Centre Paskell Cup Trial.
Sat., 27th—Cheshire Centre Reliance Cup Trial.

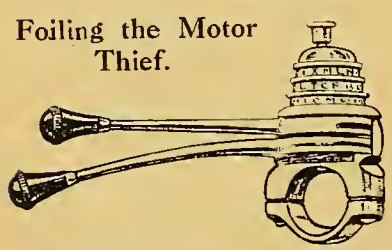
AMONG THE ACCESSORIES.

Elastic for Saddle Suspension.



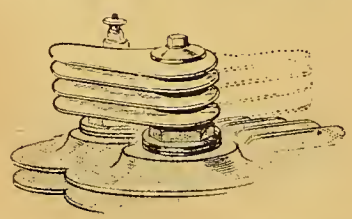
Underneath the detachable leather top of the new Lycett saddle is a network of elastic rubber cords, thus giving a very flexible and comfortable seat. (Lycett Saddle and Motor Accessories Co., Ltd., Bromley Street, Birmingham.)

Foiling the Motor Thief.



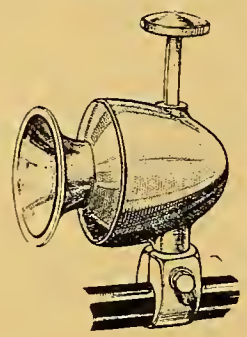
To make the ways of the motor cycle thief more difficult a combination letter lock for the carburetter levers is marketed by the Firmus Co., Ltd., 4-6, Earl Street, Westminster, London, S.W.1. The idea suggests possibilities.

Swivelling Valve Cap Radiator



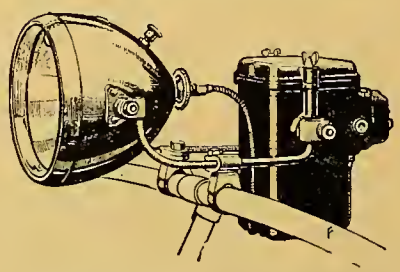
To allow an extensive radiator to be fitted in a proscribed space, the finned portion of the F.E.W. valve cap cooling tower swivels into any desired position. 7s. 6d. (F.E.W. Patents Co., 217, Gordon Road, Peckham, London, S.E.15.)

Neat Mechanical Horn.



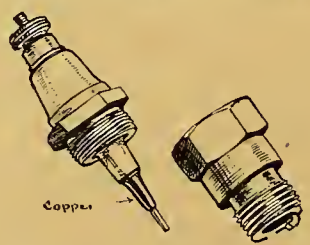
Two good features of the latest Pennant mechanical horn are its neat clip and its "clean" appearance. 27s.6d. (Pennant Manufacturing Co., Ltd., Watery Lane, Birmingham.)

Clean and Workmanlike.



Considerable neatness now characterises the head lamp and battery of the M-L Maglita combined lighting and ignition set. (M-L Magneto Syndicate, Ltd., Victoria Works, Coventry.)

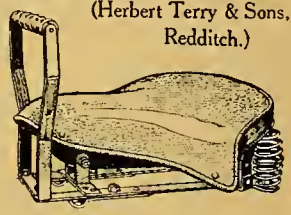
Copper Electrode Plug.



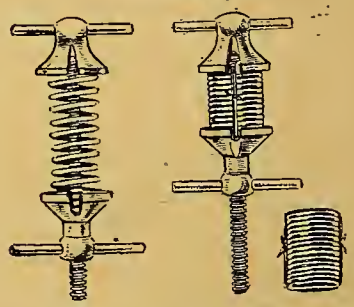
With the exception of a nickel tip, the whole central electrode of the new touring Sphinx sparking plug is of copper. (Sphinx Manufacturing Co., Ltd., Bradford Street, Birmingham.)

Saddle Type Pillion Seat.

Terrys have now produced a pillion seat on the lines of their well-known spring saddle with the addition of a handle. 63s. (Herbert Terry & Sons, Ltd., Redditch.)

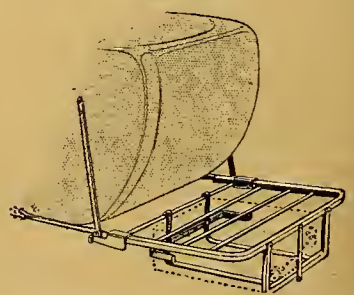


Valve Spring Replacement Facilitated.



Valve springs compressed and tied up with the Nesthill tool are easily replaced. With "needle" and twine the device costs 3s. 9d. (Ernest H. Hill, Ltd., Sheffield.)

Combined Grid and Fuel Can Carrier.



Underneath the Linco sidecar luggage grid is a rack to carry a spare tin of petrol. 12s. (F. Line and Co., 12-14, Buckingham Street, Birmingham.)

WHO'S WHO *in the* MOTOR CYCLE WORLD.

Brief Biographies of Personalities Associated with the Motor Cycle Movement.

Cyril George Pullin, Engineer, Brooklands.—C. G. Pullin was born at Wandsworth, and is 29 years old. He has accomplished many outstanding performances both before and since the war, solo and sidecar. In 1913 and 1914 he won seven cups in nine races, and in the latter year won the Senior T.T. on a Rudge-Multi. In 1913, on a similar machine, he set up new 6 hour record figures, while more later achievements include 91.68 m.p.h. mean speed on a 350 c.c. Douglas. He was the first rider to exceed 100 m.p.h. on a 500 c.c. motor cycle by official timing. His favourite type of machine is a solo mount, and his hobbies are shooting and golf.

Tom Corbett de la Hay, Engineer, Wolverhampton.—T. C. de la Hay was born at Ross, Herefordshire, and is 33 years of age. He has been a successful prize winner in motor cycle competitions over a long period. He won the Senior T.T. in 1920, was a member of the team winning the team prize in the 1914 T.T., and in 1922 won a gold medal in the T.T., a gold medal in the Colmore Cup competition, and a similar award in the English Six Days Trials. He has also won awards too numerous to mention in hill-climbs, speed events, etc. His present mount is a Sunbeam. His favourite type of machine is a 500 c.c. sports single.

John Arthur Watson-Bourne, Motor Agent, Atherstone.—Watson-Bourne is barely 27 years of age, but he has had experience with some of the earliest types of motor cycles, for two of his early machines were a 1902 Minerva and a Griffon-Zedel. During 1922 he has ridden a Brough Superior with great success. He was second in the Junior T.T., 1920, and fifth in the Senior T.T. Present mounts: 976 c.c. Brough-Superior, two Blackburne engined sporting machines and an old 499 c.c. Singer. Favourite type of machine: Big solo twin. Hobbies: Golf, fishing, shooting, motoring of any sort.

John Westwood Wills, Motor Cycle and Car Competition Driver, Wrexham.—Westwood Wills, born at Upholland 28 years ago, first came into prominence by gaining a gold medal in the Scottish Six Days Trials of 1919. He was one of two solo riders who climbed the Wrymore Pass successfully in the Cumberland Open Trial, 1921, and amongst his many successes in reliability trials is the winning of a gold medal, the North Wales Challenge Cup, the Powell Challenge Cup, and the North Wales Championship in the N. Wales Open Trial this year. Favourite type of machine: 350 c.c. solo, or sidecar. Hobby: Freak hill-climbing.

George Brough, Motor Cycle Manufacturer, Nottingham.—Few riders have so fine a record of successes in competitions of all sorts as George Brough, who possesses 89 gold medals and 34 cups. He was successful in the London to Edinburgh and back run three years in succession—1910, 1911, and 1912. He piloted a single-geared machine throughout the 1912 Scottish Six Days Trials under *The Motor Cycle* observation without opening a toolbag. Three appearances at this year's Brooklands have given him three firsts. Present mount: Brough Superior. Favourite type of machine: Big twin.

Fred W. Dixon, Motor and Motor Cycle Agent, Middlesbrough.—F. W. Dixon, who was born at Stockton-on-Tees thirty years ago, has been particularly successful with high-powered machines, both in this country and abroad. Among his major successes are the following: 1st in the Scottish Championship 1,000 c.c. Class, 1919; 1st in the Yorkshire Championship 1,000 c.c. Class, 1921 and 1922; 2nd in Senior T.T., 1921; 2nd in 500 Mile Race, 1921; 3rd in the Belgian Grand Prix, 1921; and 4th in the French Grand Prix, 1921. Present mount: 998 c.c. Harley-Davidson. Favourite type of machine: Big twin.

Howard Raymond Davies, Wolverhampton.—H. R. Davies, born in Birmingham, and 27 years of age, has scored many successes with machines of relatively small power. His greatest achievement was his win in the 1921 Senior T.T. with a Junior machine, *i.e.*, 349 c.c. A.J.S. He was second in the Junior T.T., and the first rider in the world to attain a speed of 80 m.p.h. on a 350 c.c. machine. He came in second in the 1914 Senior T.T. on a Sunbeam, and was in the winning team. Davies has won trophies for swimming. He drives a Cubitt car, but his favourite type of motor cycle is one of the 350 c.c. o.h.v. pattern. Hobbies: Riding, tennis, motoring.

Ernest Searle, Trade Rider and Fitter, Sheffield.—Searle, who was born in Sheffield 23 years ago, has been very successful in post-war reliability trials. Outstanding performances have been his winning of the Raleigh Cup for speed, hill-climbing, and reliability, a performance which gave him the coveted motor cycling championship of the North. This year he made the best individual solo performance in the Six Days Trials on a 348 c.c. Sheffield-Henderson. Present mount: 492 c.c. Sunbeam. Favourite type of machine: Single-cylinder sports. Hobby: Photography.

THE MOTOR CYCLISTS' PARLIAMENT.

A.C.U. General Committee Meeting. A Cycle Car Race Proposed for 1923. Attention to be paid to Silencing.

THE fourth meeting of the 1922 session of the Auto Cycle Union held at the Royal Automobile Club on Friday last, continued for four hours, under the able chairmanship of Col. Brereton.

Perhaps the most interesting matter brought up was the proposal, arising out of the report of one of the competition committee meetings, which dealt with a cycle car T.T. race in 1923.

The A.C.U. and the R.A.C.

In the course of the discussion which followed Mr. T. W. Loughborough pointed out, in reply to Major Axford, who considered cycle cars of the four-wheel type to be outside the A.C.U.'s scope, that it was the Union's duty to look after all vehicles used by the poorer classes. Since the war the A.C.U. had catered for three-wheelers and the R.A.C. for four-wheeled cycle cars, a simple arrangement; but on the Continent the original definition had been adhered to, which involved a capacity limit of 1,100 c.c. and a weight limit. In France this had resulted in the French Government accepting this F.I.C.M. original definition in its taxation scheme, with the result that the French four-wheel cycle car was taxed on the same basis as a motor cycle. Also, a further effect had been the losing by England of a number of cycle car records. This week the matter was under discussion at the Congress of the International Association of Recognised Automobile Clubs, and if the old F.I.C.M. regulation was upheld, the A.C.U. would have an excellent case with the R.A.C. in persuading it to recognise the old definition. The matter was eventually adjourned until such time as the control of such vehicles was again in the hands of the A.C.U.

Record Conditions to be Revised.

Under the same heading, it was announced that a special sub-committee had been appointed to deal with the regulations under which records should be run, and it was also reported that representatives of manufacturers and of the Institution of Automobile Engineers were to be invited to attend a sub-committee to deal with the all-important question of silencers.

A propos of receiving subscriptions towards a trophy to perpetuate the memory of the late Mr. Alec Ross, it was pointed out by the secretary that as the affairs of the late vice-president of the Union were in a not very happy condition, it would be more suitable, when further details were known, to collect funds towards the education of the deceased's children, which was agreed.

Much time was occupied in discussing the advisability of the A.C.U. running its own Gazette for free distribution among its own members. This idea had clearly the support of the management committee, but it was by no means certain that those present were unanimously in favour of the idea. It was finally left to the management committee to go into the matter thoroughly and report to the next meeting.

The Year's Work.

Dealing with the preparation of the report of the A.C.U.'s work during the past season, Mr. T. W. Longhborough mentioned that for the first time in the history of automobilism all organisations had worked together in harmony in their efforts to secure a more equitable form of taxation. Six thousand home and nine hundred foreign tours had been worked out by the Touring Department. One thousand members had availed themselves of the Get-you-home Scheme, and four hundred cases had been dealt with under the free legal defence arrangement.

After the accounts had been gone through, which incidentally showed that the A.C.U. competitions were run in such a manner as just to pay their way, the date of the annual general meeting was decided. This will be held on Friday, January 19th, at 2.45 p.m., at the Royal Automobile Club.

The following clubs were affiliated to the parent body:—Wessex Centre: Devizes and District M.C., Melksham and District M.C.; and Southwick M.C.C.; E. Midland Centre: Gainsborough and District M.C.C.; N.W. Centre: N. Liverpool M.C.C.; and S. Midland Centre: St. Albans and District M.C.C.

AN AMATEUR RACE IN THE I.O.M.

Manx Motor Cycle Club to Organise a Race over the T.T. Course next September.

AMATEUR speedmen will welcome the news that it is practically certain that an amateur road race over the T.T. course will materialise next year. Since the idea was first mooted the Manx M.C.C. has been convinced that it is possible satisfactorily to define the term amateur and has framed provisional regulations based upon the suggestions put forward by *The Motor Cycle* when the race was proposed last spring.

Nothing has yet been definitely settled, except that an open competition permit has been promised by the Auto Cycle Union. The purpose for which the permit was required was made quite clear to the governing body, and the difference between a promise and a grant may be accepted that in the former case the actual date had not been fixed. It is to be assumed that immediately the date is decided, the promised permit will be granted to the Manx Motor Cycle Club.

Many motor cyclists are doubtful whether a purely amateur race is a practicable proposition, and discussion on this point is bound to occur.

Now that the governing body appears to be amicably inclined towards the race and no friction is likely to occur between the Manx Club and the A.C.U., *The Motor Cycle* repeats its former offer to provide a trophy for the premier award.

MOTOR TAXATION REFORM.

Opposition by Industrial Motor Users to the Petrol Tax.

THE Memorandum in favour of motor spirit taxation signed by eleven organisations representing all classes of motor vehicle users, including, of course, the R.A.C., the A.A. & M.U., and the A.C.U., which has been previously referred to in these pages, is shortly to be considered by the Departmental Committee appointed for that purpose, but considerable opposition has been received from the users of industrial motor vehicles to a scheme of taxation based on the amount of motor spirit used, with a smaller vehicle tax.

Fair to All.

What has happened is that, although road usage as a basis of taxation is both logical and equitable, the big transport concerns cannot see any virtue in a system which means that they might have to pay more. The Motor Taxation Reform Committee feels that the Commercial Motor Users' Association would have best served the interests of the commercial vehicle community by accepting the opportunity of supporting a scheme which it must know is fair to the vast majority of commercial motor users, even though it may be that the large road users—whether motor omnibus, heavy lorry, private motor car, or motor cycle—must pay proportionately the larger taxes.

ROYAL VISIT TO THE SHOW.

H.R.H. the Duke of York Inspects Representative Motor Cycle Exhibits.

ON Friday last at 10.30 a.m. in glorious weather H.R.H. the Duke of York paid a visit to the Motor Cycle Show in company with his equerry, Flight-Commander Louis Greig.

He was received by Sir Harold Bowden, President of the Motor Cycle Manufacturers' Union, and Mr. H. R. Watling, the manager. His Royal Highness was first of all conducted to the Morgan stand, where he took a great interest in the plated Morgan runabout which is equipped with an Anzani engine, the same make as was fitted to the Duke's racing machine. He then visited the Norton, Beardmore, and B.S.A. stands.

A True Miniature.

On the Rudge stand he spent some considerable time talking to Mr. Victor Holroyd, and there closely examined the one-twelfth size model of a Rudge sidecar outfit made for the Queen's doll-house. He remarked to Mr. Holroyd that number plates were devoid of numbers, so Mr. Holroyd replied that he presumed London numbers would have to be fixed. "Not at all," smilingly replied His Royal Highness, "the King's vehicles require no numbers at all." He spent some time chatting with Mr. Duncan Watson on the Harley-Davidson stand, then proceeded to take great interest in the Argson invalid tricycles and closely examined the A.J.S. stand, where the Dorway folding side-car was demonstrated to him. He next spent a little time talking with Mr. W. H. Wells, and mentioned to him that he thought the red finish of the Indian was a considerable asset to the firm as it rendered the machine easily distinguishable on the road. The O.E.C.-Blackburne taxi also occupied his attention. He then proceeded to the stand of Douglas Motors, Ltd., and spent a few minutes in conversation with Mr. S. L. Bailey, asking to be introduced to Pullin and Emerson, who are joint holders of 57 world's records.

H.R.H. the Duke of York, who is patron of the Auto Cycle Union, showed keen interest in the exhibits at Olympia.

It was particularly gratifying to note that the Duke of York did not neglect the smaller stands, as he spent a considerable period having the interesting G.S.D. explained to him.

Nor did the accessories escape H.R. Highness's notice, for he made a complete tour of the Gallery, where he had Le Vack presented to him. It is clear that the patron of the A.C.U. takes great interest in motor cycle racing.

"THE MOTOR CYCLE" FILM.

NUMEROUS visitors to the Show went to the Broadway Cinema, Hammersmith, last week and there viewed *The Motor Cycle* film, which was exceedingly well received. Hearty applause greeted many of the incidents in the film, and the appearance of the popular winners of the T.T. races was vociferously acclaimed.

During the week an application for the film has been received from the Eton Scientific Society for an early date in December, stating that if the 1922 film was not available the 1921 edition would be just as acceptable. An application for the film has also been received from France, and it is quite possible that at the end of its British tour the film will go to certain Continental clubs. An application has been made for the 1921 film to be shown in Australia.

To-day the Southern film is being exhibited by the Aberdare and District M.C.C. at Haggers Kosy Cinema, Market Street, Aberdare; on Friday by the Blaina and District M.C.C., at the Gaiety, Blaina, and on Saturday by the same club at the Empress, Abertillery. The Northern film was shown at Southport yesterday, and will be on view by the Widnes M.C.C. at the Co-operative Hall, Widnes, this evening; on Friday, by J. M. Mottershead, 157, Palatine Road, West Didsbury, and on Saturday by the County High School Old Boys' Club, 16, Market Street, Altrincham, near Manchester.

Next week the Southern film will be exhibited by the Gloucester M.C. and L.C.C. at the Theatre de Luxe, Gloucester, and on the 14th by the Richmond and District M.C. at the Princes Hall, Richmond, while the Northern film will be shown by the Cosy Cinema Co., Co-operative Hall, Queen's Ferry, near Chester, on Monday, the 11th, and by the Shirebrook M.C. at the Shirebrook Empire on Thursday, the 14th.

CHATER-LEA TRACK SUCCESSES.

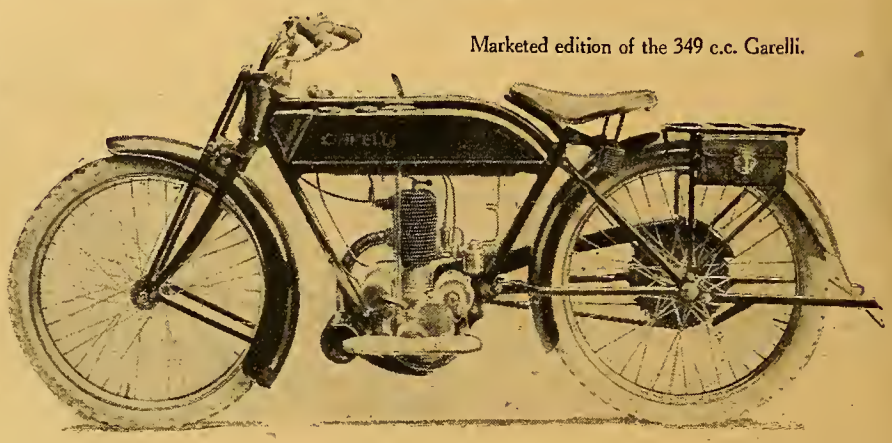
THOUGH possessing an enviable and world-wide reputation for reliability, the firm of Chater Lea, Ltd., has until the present rigidly abstained from speed events. It is now to be recorded that the first Chater-Lea record attempts have been rewarded with brilliant success. Using a 348 c.c. o.h.v. Blackburne engine (also a new departure for the firm), W. D. Marchant, on a Chater-Lea sidecar outfit, captured the 50 miles record, time 50m. 21.92s., and the one hour—57 miles 1,305 yards, averaging 59.26 m.p.h. for the 50 miles, and 57.74 m.p.h. in the hour.

AN ITALIAN TWO-STROKE.

The 349 c.c. Garelli Now Available in England.

THOUGH described in *The Motor Cycle* immediately after its success in the 350 c.c. class of the French Grand Prix, a further reference to the unconventional Garelli two-stroke cannot fail to be of interest, especially as the makers are now represented in England.

Few examples of departures from accepted practise, such as the Garelli is, have attained success at the very outset of their careers, but with this machine success was obtained not only in the small field at Strasbourg but in a much larger and more dangerous one of 39 riders on the Monza track in the Gran Premio delle Nazioni. It must be mentioned here that the engine design is not actually novel and owed its origin to an English inventor, but the Cavaliere Garelli was the first to adapt the principle to a motor cycle engine.



Marketed edition of the 349 c.c. Garelli.

Two Pistons on One Rod.

Briefly the Garelli engine (50 × 89 mm.) has two cylinders with clear air space between, two pistons and a common combustion chamber. Of the two pistons which are of chrome nickel steel the right-hand one has a flat top and the left-hand one a domed top, which acts as a deflector and prevents turbulence. These pistons, which are, of necessity, very long, are connected at their base by a single gudgeon pin in the centre of which works the small end of the single connecting rod.

On the mixture supplied by a one-lever Zenith carburetter (fitted with additional extra air inlet) being drawn into the crank case and compressed, the transfer port, which is inside the cylinder (actually in the dividing wall between the two) is uncovered by the left-hand piston, fills the left-hand cylinder and the combustion chamber and helps to expel the residue of burnt gases in the right-hand cylinder as the exhaust port is still uncovered; the pistons then rise and compress the charge which is fired by the plug in the left-hand cylinder, but as there is a common combustion chamber both pistons receive the explosion pressure.

Following the tendencies of modern Italian design unit construction is followed, but otherwise the lower part of the engine follows standard two-stroke practice in the main, but there are two inside flywheels, one of which incorporates a most ingenious transmission shock absorber.

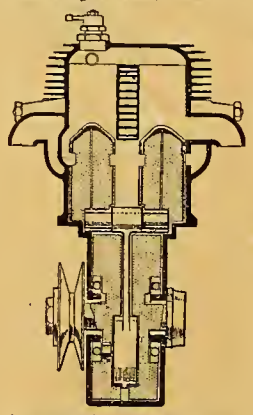


Diagram showing the double piston and cylinder. The flywheels are carried on ball-bearings mounted on fixed bosses to the crank case.

A star-shaped piece forms part of the main shaft and between the points of the stars there engage corresponding spring-loaded plungers, which work in steel bushes in the flywheel of the racing engine, while in the case of the touring engine a disc clutch pattern shock absorber is employed. Particular mention should be made of the clutch, which is of the multi-disc variety and is entirely enclosed in the unit, which, of course, contains the first reduction gear by spur wheels and the change speed gears.

Magneto Completely Enclosed.

Equally as neat as the clutch is the Mea-Garelli magneto, which is likewise entirely enclosed in the unit, but is easily detachable therefrom.

The result of this design is that the whole of the mechanism is enclosed and the only visible moving part is the final transmission chain.

Not the least interesting part of the machine is the internal expanding brake in the back hub, which possesses two sets of shoes, with the result that two independent brakes are incorporated in the one shell, each separately controlled.

Detachable wheels are fitted, and the front forks, which are of a special design, are extraordinarily flexible.

All controls are entirely enclosed, no naked wires being visible, while the change speed lever acts directly on the gear box, there being no intermediate toggles or rods.

Owing to the high-class finish and the fact that there is a heavy import duty on the machine the price is high, being £135.

Now that the Garelli has arrived in England its road performances will be as eagerly awaited as its victories in races were acclaimed in the most important Continental events during the past season. A. F. Lago, Ltd., 2, Featherstone Buildings, High Holborn, London, W.C.1, are handling the machine.

A cylindrical gear-driven magneto is housed in the crank case.

Grand Prix pattern of the Garelli with twin exhaust pipes.

DEVELOPED AT BROOKLANDS.

Trump Models with Single- and Twin-cylinder Engines.

PRODUCED at a comparatively small factory, Trump motor cycles owe their success mainly to two reasons: firstly, that the said small factory is within easy reach of Brooklands track, and secondly that their designers are practical riders whose successes on road and track date from the founding of the B.M.C.R.C. and even before that period.

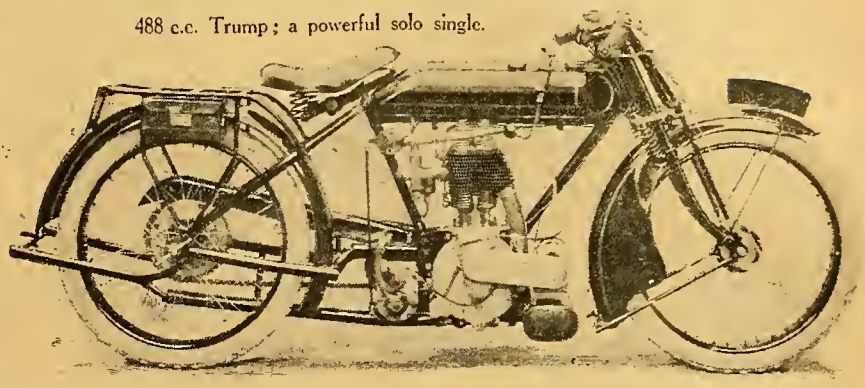
One of the most attractive of the 1923 Trump machines is the 346 c.c. model, fitted with a 70×90 mm. sports J.A.P. engine. Its lines are symmetrical, and it has a most pleasing appearance, and though it departs little from accepted principles it embodies several excellent features.

In company with many other makes, the question of silence has received very careful attention. Placed as close to the exit of the exhaust gases from the cylinder as possible is an oval expansion chamber possessing an area more than four times the capacity of the cylinder, while the tail pipe is carried rearward to a point beyond the level of the rear wheel spindle.

Pannier Tanks.

Mention should also be made of the tank design, which is unconventional. A flat sheet of steel is bent over the top tube and bolted beneath the secondary frame tube, while each half of the tank is attached by rivets and soldering to each side. The oil tank is a separate unit built into the offside tank compartment, so there is no danger of leakage. The result of this design is that the two tanks sit astride the two upper frame tubes are immensely strong, have no internal soldered joints, and are free from leaks. Each tank is connected to a common pipe with the usual taps, allowing either or both tanks to be used. Two gallons of petrol and three-quarters of a gallon of oil are carried. In this model a Webb front brake is fitted, while the rear brake is of the shoe type acting on a dummy belt rim.

488 c.c. Trump; a powerful solo single.



Closely resembling the 346 c.c. machine is the J.A.P.-engined 488 c.c. model, 85.5×85 mm. Both have the close ratio Sturmey-Archer gear boxes incorporating a transmission shock absorber, but the larger machine has not only the Webb front brake but the Chater Lea back hub, which incorporates an internal expanding brake, and both hubs possess knock-out spindles.

Both machines have Lycetts racing saddles, of which the peak as well as the rear portion is sprung.

In addition to these models, Trump Motors, Ltd., Foxlake Works, Byfleet, Surrey, produce a fast twin-cylinder, which may be had either with the 770 c.c. J.A.P. engine (76×85 mm.) or the 976 c.c. (85.5×85 mm.) super-sports J.A.P. engine; the latter has a guarantced speed of 80 m.p.h. This machine is also suitable for pulling a sidecar.

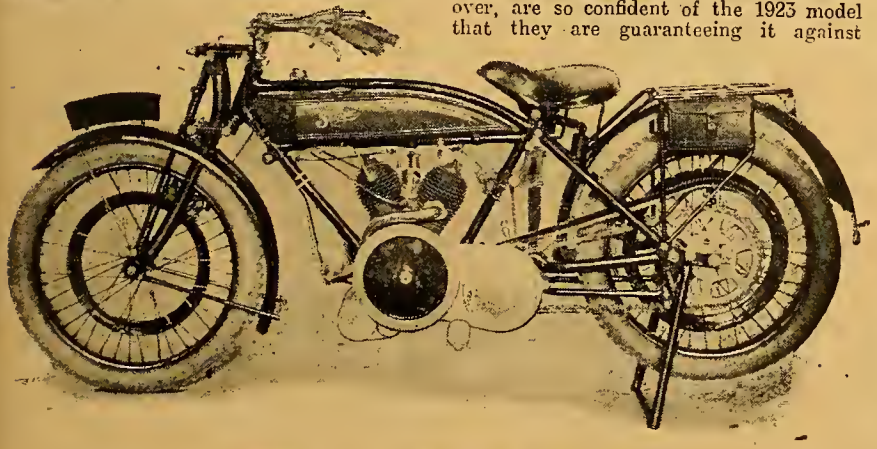
Finally, the 996 c.c. Anzani-engined racing model must be mentioned. The engine is of the most efficient design, having overhead valves (four per cylinder), and a bore and stroke of 83×92 mm. It was on one of these machines that Col. R. N. Stewart broke the Class E. two hours' record on June 14th this year.

Trump prices for next year are:—346 c.c. sports model, £70; 488 c.c. model, £95; 770 c.c. twin-cylinder model, £120; and the 996 c.c. Anzani-engined racer, £135.

THE ONLY TWO-STROKE V-TWIN.

Detail Improvements in the 1923 Stanger. Bigger Tyres and Better Brakes.

UNIQUE in being the only two-stroke machine which has a V-twin engine, giving the same torque impulse sequence as a four-cylinder four-stroke, the 538 c.c. Stanger is a thoroughly practical machine, with a very satisfactory spring frame, as we have proved from personal experience. Its makers, moreover, are so confident of the 1923 model that they are guaranteeing it against mechanical defects for twelve months. So as to avoid tyre troubles and to render the machine more comfortable, new wheels with flat base rims to take 26×3in. tyres have been incorporated in the next season's pattern, while the braking system has also been considerably improved, firstly by the fitting of a Bowden belt rim brake to the front wheel, and secondly by fixing the rear brake pedal on the right-hand side, independently of the footrests.



Stanger V-twin two-stroke, with spring frame

Adequate Ground Clearance.

Overseas users will be interested to know that one inch greater ground clearance has been provided in the new model. Both mudguards are of ample dimensions and are 5½in. across. Greater flexibility has been obtained by the fitting of a two-jet Binks carburetter, and all-chain drive is a feature, flexible transmission being obtained by the use of the Brampton spring-link chain.

Stanger motor cycles are made by The Stanger Engine Co., 13, Steele Road, Tottenham, London, N.17.

Club News

Yorkshire Centre A.C.U.

At a meeting of the Centre Board held at Leeds on November 18th, the resignation was accepted, with regret, of Mr. J. N. Longfield from the post of chairman and A.C.U. delegate.

North London M.C.C.

On December 9th the annual dinner is taking place at the Holborn Restaurant, when the president of the club, Major Sir Philip Lloyd-Greame, K.B.E., M.C., M.P., president of the Board of Trade, will present the awards won by members during the year.

Newport and County M.C.C.

The club was strongly represented at the annual dinner on the 15th ult., over one hundred being present. Several toasts were proposed and responded to, while the Mayoress presented a large number of medals and prizes.

Ashford M.C. and L.C.C.

The Motor Cycle film will be shown at the Palace, Tufton Street, Ashford, on the 22nd prox., twice during the evening. Members should arrange among themselves to attend either the first or second "house."

North Wales M.C.C.

The third annual dinner takes place on Saturday, the 9th inst., at The Castle Hotel, Ruthin, when the trophies and other prizes won during the year will be distributed. Tickets may be obtained from Mr. J. H. Davies, 1, Ruthin Road, Denbigh.

Bristol M.C. and L.C.C.

About one hundred and thirty persons were present at the club's annual dinner and presentation of prizes, held at the Full Moon Hotel, Bristol, on the 18th ult. The guests of the evening were Mr. T. W. Loughborough (secretary of the A.C.U.) and Councillor A. Taylor (president of the Bath and West of England M.C.). Toasts were responded to by the president of the Wessex Centre A.C.U., and great tribute was paid to the Bristol club's hard-working secretary, Mr. Rex Poweraker.

Epsom and District M.C.C.

A reliability trial took place on November 26th over a sporting course of 43 miles, starting from the King's Head Hotel, Epsom. The premier award was a silver cup presented by the club. The course led to Headley Heath, then over tracks and main roads to Broadmoor, where, although the going was rough, all made good climbs except Ede (490 Zenith), Masters (348 Douglas), Chamberlain (499 Triumph), and Longhurst (Morgan). Final awards were:—

Silver Cup for best performance, R. B. Furniss (678 Martynside sc.), lost no marks.

Silver Medals were gained by E. G. Tyler (499 Sunbeam sc.) lost no marks, and H. Garland (550 Triumph), P. C. Polhill (348 Zenith), J. A. Chuter (488 Zenith), all of whom lost 5 marks each.

A Bronze Medal was awarded to R. Chamberlain (499 Triumph) with a loss of 15 marks.

Ipswich and District M.C.C.

Clay, mud, sand and watersplashes played a prominent part in the club's recent one-day trial for a cup presented by the Motor Trade Association. The forty miles course had to be covered twice, and included some very stiff obstacles, including a sandy hill with a 1 in 3 gradient. On this hill the easiest path was purposely blocked, and only three competitors, E. H. Gowing (499 Sunbeam), V. Ollson (492 Sunbeam), and E. C. Claxton (550 Triumph), made clean ascents. Most of the riders checked in very late. Results:—

WINNER OF M.T.A. CHALLENGE TROPHY.—F. K. Portway (633 Norton sc.), 48 marks lost.

RUNNER UP.—R. Fenn (499 Triumph sc.), 69 marks lost.

350 c.c. SOLO.—A. V. Adams (249 Diamond), 118 marks lost.

UNLIMITED SOLO.—E. H. Gowing (499 Sunbeam), 99 marks lost; V. Ollson (492 Sunbeam), 107 marks lost.

600 c.c. SIDECARS.—V. Revett (499 Rudge sc.), 125 marks lost; C. O. Rose (598 Beardmore-Precision), 168 marks lost.

UNLIMITED SIDECARS.—H. O. Goldsmith (976 Brough Superior sc.).

Hull M.C.

The annual night trial for the Morrell trophy was run off on Saturday. Results have not yet been announced.

Cork and District M.C.C.

Although "things are very quiet," as regards motor cycling, the club is very active, and has opened a club-room at 10, Winthrop St., Cork.

Matlock and West Derbyshire M. and M.C.C.

Owing to the growing area from which members are being recruited, the club will be known in future as the "West Derbyshire M. and M.C.C."

Wigan M.C.C.

It is proposed to form a club as above, and those in the Wigan district who are interested should communicate with Mr. D. M. Kaye, 1, Thornhill, Boar's Head, Wigan. The club will cater only for sidecar enthusiasts, and will be run more on the lines of a social club than one devoted to sporting events.

Keighley M.C.C.

The chief award in the 56 miles non-stop trial on the 26th of last month was the "Sportsman Trophy" and gold medal. The course consisted of four circuits of 14 miles each, and with the exception of a short stretch of main road near Addingham, was composed of rough moorland tracks in which the well-known ascent to Keighley Gate was included. Some good sport was witnessed, and the best all-round performance was that of W. Smith (481 Scott Squirrel), who completed the course with the loss of only five marks.

Central Wolverhampton M.C.C.

The winter programme of social evenings was opened on the 11th ult., when a most enjoyable musical entertainment arranged by one of the lady members was given at the Talbot Hotel, King Street. The club members availed themselves of this opportunity of entertaining as their guests Mr. and Mrs. F. W. Giles, and congratulating Mr. Giles on the numerous honours awarded him during the past season. Mr. Giles, in respondiog, said that nothing would please him better than to be numbered amongst its members; he wished the club success in its future developments.

Imposing trophy presented by the Neath and District M.C. for the Welsh T.T.—a 100 mile race on Pendine Sands, won this year by C. P. Wood on a Scott.

Yorkshire Centre A.C.U.

At a meeting of the Centre Board held on the 18th ult., it was decided that the second annual general meeting be held at the Guildford Hotel, Leeds, on the 15th prox., at 7 p.m.

Surbiton M.C.

The club dinner will be held at the Hotel Cecil, Strand, on the 16th inst. After dinner the cups won during the season will be presented, and the function will be concluded by a dance.

Bradford M.C. and L.C.C.

On the 10th inst. the club will run off its annual winter trial for the "Richmond" trophies. The route is about ninety miles in length, and is confined entirely to main roads.

Coatbridge, Airdrie and District M.C.C.

On the 17th ult. the club held its annual supper and presentation of prizes at the Eagle Hotel, Coatbridge. After an excellent supper the prizes were handed over by the chairman to the winners.

South-East Essex M.C.C.

Formed only recently, the above club is growing steadily, and has nearly fifty members. Those wishing to join should communicate with the hon. secretary, Mr. H. T. Baldwin, The Bungalow, South Woodham, Essex.

Basingstoke M.C.C.

Forty members were present at the annual dinner held on the 7th ult. After several bright speeches had been made, cups and medals won during the season were presented, and the evening was concluded with a musical entertainment.

Worcester and District M.C.C. and Worcestershire M.C.

To-day, the 7th inst., is the date fixed for the annual dinner. In addition to the prize distribution, a comprehensive orchestral and vocal programme has been arranged. The annual general meeting, followed by a smoking concert, will be held at the Pack Horse Hotel, Worcester, on the 11th inst.

Richmond and District M.C.C.

The Motor Cycle film will be shown at Prince's Hall, Richmond Green, on the 14th inst., at 7.30 p.m. The exhibition will be followed by a dance. Tickets (price two shillings and tenpence) may be obtained from the hon. secretary, Mr. S. I. Elfick, 64, London Rd., Isleworth, from any member of the committee, or at the door.

North Liverpool M.C.C.

A whist drive will be held on the 19th inst. at the Stanley Park Assembly Rooms, Walton Lane, Kirkdale, Liverpool, commencing at 7.45 p.m. A number of very handsome prizes are offered. Tickets (price 2s. 6d., including refreshments) may be obtained from Mr. W. J. Sergent, 25, Spellow Lane, Walton, Liverpool.

Southport A.C.

The annual general meeting will be held at headquarters, the Queen's Hotel, Southport, on the 19th inst., at 8 p.m. The annual dinner and presentation of prizes will be held at the same place on the 21st inst. at 7.30 p.m. Tickets (7s. 6d. each) may be obtained from the hon. secretary, Mr. Rowland Hill, 75, Selton St., Southport.

Aberdeen and District M.C.

The annual dinner and prize presentation was held at the Douglas Hotel, Aberdeen, on the 24th ult., over sixty members and friends being present. Cups and prizes were presented at the conclusion of an enjoyable musical entertainment. Members are reminded of the whist drive and dance on the 15th inst., and the dance and exhibition of *The Motor Cycle* film on the 19th prox.

They're going down like ninepins!

MAXALDING is the Most Perfect Method of DRUGLESS HEALING.

A MAGNIFICENT EXAMPLE of all-round supple development and control secured entirely by MAXALDING methods without apparatus of any kind. N.B.—No chairs, hassocks, chests of drawers, or other furniture required in Maxalding.

EXTRACTS FROM TESTIMONIALS RECEIVED FROM CORRESPONDENCE PUPILS AND PATIENTS

NOT "TOO OLD" AT 56.

Gentleman, age 56, residing in Antwerp, Belgium. Desired eradication of Constipation and increase in general fitness. Writes:—"I feel a different man altogether since starting your course. Constipation is cured and I am 100 per cent. fitter. I am getting into good condition, all flabbiness going and muscles taking shape. For two nights running I had a game of football with the boys and felt no bad effects. About ten days ago the carpenter had a job to start the tackle on a frozen shackle of a three-ton anchor. I gave him a hand. It took us over an hour to make it workable. We took spells about, using an eight-pound hammer. When finished, the carpenter, used to manual labour and 25 years younger than myself, complained about feeling sore. I felt splendid, and did some writing afterwards. A good test. A year ago if I had done any running or used a hammer, I should have been crippled. It is getting a common thing now to be asked how I keep in such good condition. I tell them to apply to Maxalding, London, who will keep them the same."

CONVINCED MAXALDING IS A PERMANENT CURE.

Lady, aged 29, residing at Weston-super-Mare. Desired eradication of Constipation and Insomnia, and increase in vitality. Writes:—"I am glad to say that the constipation is much better. I have mastered the exercises quite well and enjoy going through them. I sleep much better and wake quite refreshed in the morning. Also I certainly look better and feel better since starting your course. I am convinced that Maxalding is a permanent cure."

VERY MARKED PROGRESS IN FOURTEEN DAYS.

Gentleman, age 45, suffering from Constipation, Indigestion, Biliousness, and Insomnia, writes after taking only two lessons:—"Having been away, I only received your two lessons on my return on September 4, on which day I started the exercises. I am very glad to be able to tell you that I have already made marked progress. I have not taken any laxative since I started the exercises, and am already getting a regular movement of the bowels. My tongue is slightly cleaner and my complexion is also clearer. Thanking you for the interest you are taking."

Free diagnosis and explanatory Booklet will be sent post free. When writing please state whether you desire (1) Eradication of Functional Disorder; (2) The Development of Nervous Energy; or (3) Great strength, speed and Heavy Muscular Development.

is ensured if you fit a

WATES
ELECTRIC LIGHTING SET

It will need no attention . . . a touch of the switch will instantly light your path with brilliant light.

Designed carefully in every detail to withstand vibration and all bad weather conditions. Up-keep cost is much less than with acetylene lighting.

Night riding becomes a pleasure with a reliable lighting set.

You can convert your existing acetylene lamps to electric or completely equip your mount with new lamps.

Solo Sets from ... **£2 5 0** Combination Sets from ... **£3 5 0**

In the Solo-Conversion Sets the accumulator fits on the existing Acetylene Lamp Brackets. The following lamp sets are all suitable for holding the accumulator case; they are not the only sets that can be converted, but give an idea of what is required. Powell & Hanmer Lamps, Nos. 127 H.B., 127 S.B., 128 H.B., 128 B., 125 H.B.; Miller's Lamps, Nos. 29 H., 31 H., 24 S., 22 H.; Lucas Lamps, Nos. 462, 341, 331.

A SENSATIONAL ACCUMULATOR OFFER.

Wates Standard Accumulators are priced as follows:—

4 Volts	40 Amps.	. . . . .	15/9

"IXION" AMONG THE ACCESSORIES.

Novelties in Items of Equipment at Olympia.

WHEN I have familiarised myself with the new motor cycles at the Show, I always rake over the accessories in the gallery, and generally discover some dozen or so of novelties which simply *have* to be bought at once. This year proved no exception to the rule, and I came downstairs again with bulging pockets. My first treasure is a new tool by Ernest H. Hill, Ltd., 56, Broomhall Street, Sheffield, for compressing stiff valve springs prior to tying them up for replacements; we all know how the spring usually leaps out of the vice and disappears. This inexpensive gadget consists of a screwed rod carrying two steel cups large enough to embrace any size of spring and slotted to allow the threading of the string.

From the Pennant Mfg. Co., Watery Lane, Birmingham, I purchased several excellent spanners and an aluminium-handled screw-driver. But I was principally charmed by the railway-carriage key for sidecar or car toolboxes: these keys are a terrible incubus in one's pocket, but the Pennant edition has hinged side arms to its T.

J. A. Ryley, of 73, Weaman Street, Birmingham, sold me a set of spring steel clips for fastening gas piping to the frame tubes.

More than one stall staged the "Atlantic" bulb box, which carries spares for a dynamo lighting outfit as flatly and securely as the facts permit. At present these are only made in car size to carry five bulbs; but they are "the best yet."

S. Smith & Sons were noted down as having standardised a solo instrument board, made of polished aluminium and fitted with universal brackets for ready attachment to any type of handlebar: the exhibition sample mounted speedometer, clock, ammeter and switches.

Alfred Smith, of George Street, Birmingham, had quite a counter full of interesting gadgets. A folding petrol funnel for the pocket, made of leather, quite flat, and very cheap. The "Stedilite," fittable to any acetylene generator, and calculated to equalise the water flow and prevent the water valve from choking. The Vici solderless union for oil and petrol pipes, a sound article of which my stock needed replenishing. The Vici solderless nipple for control wires: this I did not know, but am carrying for roadside emergencies.

The Chemico Works, Birmingham, presented quite a new version of the old "3 in 1" liquids with which all pedal cyclists are familiar. Sold as "T.P. Car Polish," this dope is equally efficient for cleaning metal; sidecar coachwork; or the human hands. On Brown Bros. stand I found a very handy tank stopper with which an oil gun is incorporated.

"DESOLATION" rather aptly describes the camera's reproduction of this scene near Glencoe

SHOW IMPRESSIONS OF AN ORDINARY RIDER.

Things that Struck a Non-technical but Enthusiastic Everyday Motor Cyclist.

This article sets forth the ideas of a typical reader of "The Motor Cycle." Not a journalist, not an engineer, in no way connected with the motor cycle trade, he has expressed the view of a practical user to whom definite advantages in design rather than theoretical talking-points would appeal.

THIS year's Show reveals to the ordinary rider a degree of advancement that must surely be without parallel in the history of the motor cycle.

Apparently, at last, manufacturers have begun to realise that it is only by the designers having actual experience with the machines they produce or, at any rate, by their drawing upon the experience gained in competition work, that they can ever hope to design a machine that for ordinary use approaches the ideal.

Two notable examples of the advantages of this procedure are afforded by the A.J.S. and New Imperial productions, both of which, in the light of knowledge gained, have, where necessary, been modified in design so that they are well-nigh perfect.

In view of the speed capabilities of the modern machines, the question of "braking" is one of the utmost importance, and it is indeed pleasing to note that much attention has recently been paid in this direction. It is now the rule rather than the exception for a machine to be fitted with brakes of the internal expanding variety on both the front and rear wheels. One or two manufacturers, however, no longer fit a front brake, but apply both brakes to the rear wheel, apparently neglectful of the fact that there are occasions, such as the descent of a greasy hill, when the front brake is of far greater avail than the back.

Work Still to be Done.

Unfortunately, there still remain three faults in the present-day machine, all of which must be eradicated before "the man in the street" becomes a convert to motor cycling, and these are mudguarding, silence, and comfort. For years *The Motor Cycle* has attempted to make manufacturers appreciate that the vast general public will not take up motor cycling as a sporting pastime, but merely as a utilitarian mode of travel, with the consequence that if a journey by motor cycle must needs mean that they arrive at their destination tired out and plastered with mud, then they will never be motor cyclists. It is difficult to name more than a couple of machines which do not embody at least one of these three faults.

Some excellent attempts to solve the problem of mudguarding are, however, to be seen, and on some machines the mudshields not only keep the rider clean, but also deflect air on to the engine, and so assist the cooling instead of detracting from it, as is usually the case. Silencing the exhaust has in most cases been carefully considered, but only in few has the elimination of mechanical noise received due attention. The valve gear is generally considered to be the noisiest mechanical feature of the modern motor cycle, and yet there are few side-valve machines on which the ingress of dirt to the valve stems and guides is prevented by enclosure. Backlash is largely the cause of the noise, and this cannot help but occur if the mechanism has to work in an abrasive mixture of oil and road grit, as is usually the case.

As regards comfort, it seems strange that, while no one in his senses would consider the purchase of a car possessing a rigid chassis, yet year after year we are, almost entirely, provided with sidecar outfits that are rigid except for the front forks. Surely it is not beyond the ingenuity of the modern designer to produce machines on which the only unsprung weight is the wheels! True, several firms have produced satisfactory systems of springing, but these are only exceptions which prove the rule. Concerning the present-day spring forks of proprietary make, it is, indeed, regrettable to note that apparently only on the Montgomery has any adequate provision for lubrication been made. The sensible arrangements made for this on the Cedos and 976 c.c. New Imperial are worthy of examination.

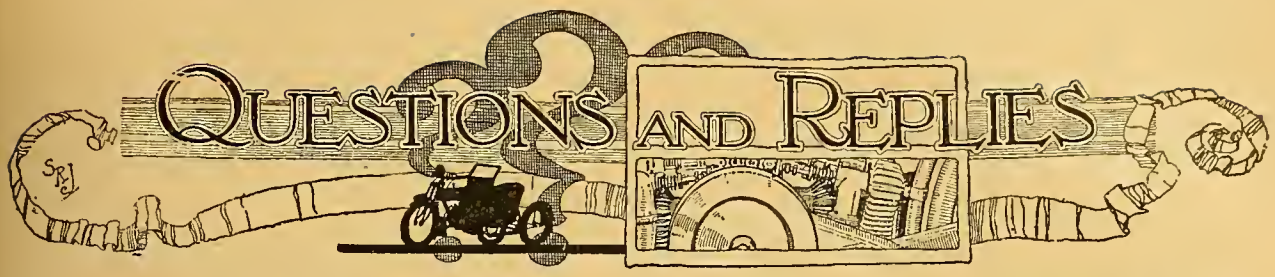
More Speeds.

Last year the manufacturers of lightweight machines commenced fitting three-speed gear boxes, and now these are a standard feature of every make; some designers have even gone a step further in realising the truth of the axiom that the smaller the engine the greater the number of gear ratios necessary, and are fitting four gears instead of three. Notable among the machines so equipped is the renowned J.E.S. and the new but beautifully designed shaft-driven G.S.D.

Nowadays there is hardly a lightweight that is not listed as suitable for both solo and sidecar work, and so perhaps a description of the actual capabilities of these mounts, when used as sidecar outfits, may be of more than passing interest. The writer, in the course of over three years' experience, with outfits of this type, has found that with an efficient engine used in conjunction with a three-speed gear (four, for preference), a most economical form of motoring for two is obtained, provided that consideration is shown to the engine and machine as a whole.

An enormous amount of attention has been paid to detail work, especially as regards increasing the efficiency, but few makers, however, appear to remember that even more important is the ability for a machine to be cleaned or at any rate made to look presentable in a few minutes. A clean machine is always a good advertisement, and but few machines will be kept thus, unless it be a simple matter. The smoothing off of crank case and gear box exteriors, the enclosing of valve gear, the brazing on of all clips, and the fitting of domed nuts, as on the new Massey, are a few points well worthy of attention. That it is by no means impossible to obtain smooth exteriors is proved by several examples of unit construction and by the new Moss three-speed gear box. Finally, why can't we have more machines embodying but four sizes of nuts, as is the case on the Wooler?

A. B. B.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 1½d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the top left-hand corner of the envelope, and should be kept distinct from questions bearing on technical subjects.

ROUTES.—By special arrangement with the Automobile Association and Motor Union, readers of "The Motor Cycle" desiring routes may enjoy the benefit of the Road Service Department of that organisation. Queries should be addressed to the Editor in the ordinary way (enclosing a 1½d. stamp), and will be dealt with by the A.A. and M.U., who are regularly in receipt of reports from their representatives all over the country as to the existing state of the roads in any particular locality.

GEARING.

Could you let me know what gear I have on my 1917 Clyno outfit? There are 13 teeth on the engine shaft driving to 28 teeth on gear box. Then 13 teeth driving to 34 teeth on the back wheel. The wheel size is 650 × 65 mm. with 700 × 80 mm. tyre fitted. I find that I never use the lowest gear, also second gear very seldom with full load. I thought of fitting a 15-tooth sprocket on the engine shaft. Would you think the gear would be too high?—J.T.M.

At present the gear ratio is approximately 5½ to 1 with the 700 × 80 mm. tyres (the actual ratio is 5.6 to 1). We do not recommend you to fit a larger engine sprocket than one with 14T, as a rather low gear seems to suit these machines best.

MECHANICAL NOISE.

My 770 c.c. twin B.S.A. is more noisy than I should like it to be. I have adjusted the tappets, and have tried advancing the ignition, without effect. Can I make it less noisy without a great loss of power?—A.G.B.

You do not state the age of your machine, but if the noise is not eliminated by adjusting the tappets and taking up the slack in the driving chains, we should imagine that it is due to some of the parts being worn, particularly the timing gear or the valve tappets. A possible source of noise is fracture of the engine-shaft shock absorber springs; these should be examined.

PREPARING FOR A HILL CLIMB.

I am tuning a Mark 2 Villiers engine for a speed event. (1) What oil is most suitable for the actual event? (2) How soon before the event ought I to decarbonise? (3) Are new piston rings desirable? (4) Are an aluminium piston and drilled connecting rod advantageous on a two-stroke? (5) What jet do you recommend? (6) The drive is direct with a ratio of 6 to 1. Would it be advisable to raise the gear for a hill of about 1 in 15? (7) How should I time the ignition?—C.P.

(1) Use the oil which you have found satisfactory for ordinary running. (2) It would be inadvisable to decarbonise the engine unless you could give it about 50 miles running before the event. If you cannot do this only clean out the exhaust port and pipe, and the piston top and cylinder head if very heavily encrusted. (3) If the compression is good, it is not necessary to fit new piston rings. (4) It is doubtful whether an aluminium piston would effect any improvement and the same applies to drilling the connecting rod; one effect of drilling the rod of course, is a slight lowering of crank case compression which is undesirable. (5) 26-28 or experiment with a variable jet. (6) It would not be advisable to raise the gear ratio appreciably. (7) Time the spark so that it occurs just before top dead centre on full retard.

Important Dates.

Tues., Dec. 26th, and Wed., Dec. 27th—M.C.C. London-Exeter Run.

Sat., Jan. 13th, to Wed., Jan. 24th.—The Belgian Salon.

Fri., Jan. 26th, to Sat., Feb. 3rd.—Scottish Motor Show.

Mon., June 11th—Junior T.T. Race.

Wed., June 13th—Lightweight T.T. Race and Sidecar T.T. Race.

Fri., June 15th—Senior T.T. Race.

SMALL CAR PROGRESSION

"THE AUTOCAR"—published from the offices of "THE MOTOR CYCLE" and conducted on the same enterprising lines—is the complete automobile journal embracing small, medium, and large cars. Every motor cyclist contemplating the purchase of a light car should read

The Autocar

Every Friday 4d.

Founded in 1895, "THE AUTOCAR" is the largest and most successful automobile paper and enjoys the greatest circulation. It is universally accepted as the representative British motoring journal.

LAW AND BRAKES.

A week ago I lent my sidecar outfit to an unemployed friend of mine to go after a position and he was stopped for not having a front brake, and has to appear at the police court at some future date; also last night a detective came to my house and told me I was to be charged with aiding and abetting in the offence. Will you advise me as to my position, as I do not want to go to the court in ignorance?—H.C.G.

A motor cycle requires two independent brakes in good working order, and of such efficiency that the application of either to the machine will prevent the wheel revolving. If your machine has two effective brakes, separately controlled, neither you nor your friend should be prosecuted for not having one of the brakes on the front wheel. There is nothing in the regulations as to which wheel the brakes shall be applied. Assuming, however, that your friend has committed an offence, then you, as owner, would be liable for aiding and abetting, seeing that you loaned the machine to a driver knowing that he would commit an offence by driving a motor cycle not complying with the regulations.

POWER FOR FAMILY SIDECAR.

I am about to purchase a sidecar outfit, and the proposed load is three persons weighing 6, 10, 12 stones respectively (28 stones); the sidecar must come well up at the back to give shoulder support, and must be roomy enough to take a seat for the child. I have been trying an old single-cylinder Humber, but find it a struggle to climb quite ordinary grades on this, so would like you to tell me (1) What power is required to take the proposed load? (2) Would a 1915 twin, described as "5-6 h.p.," be powerful enough? (3) Would a modern single-cylinder do the work?—P.R.

(1) No single-cylinder machine of less than 550 c.c. cylinder capacity should be selected, and a twin of 750 c.c.-1,000 c.c. would be even better. (2) If in good condition the type of machine you mention should answer your purpose, but a new machine would be preferable. (3) A modern 550 c.c. single would do the work you require in all but the most mountainous districts; on long journeys, however, the average speed is lower than that obtained with a big twin.

GOGGLES OVER SPECTACLES.

Being troubled with short-sightedness in one eye, I have to wear eye-glasses at all times, but while motor cycling I also wish to wear goggles. Can I obtain goggles that will fit over my eye-glasses? If it is possible, I do not wish to go to the expense of having special lenses made and fitted in to a pair of ordinary goggles.—A.R.

You should not have the slightest difficulty in procuring a pair of goggles that project sufficiently far from the eye to allow of eye-glasses being worn at the same time. Those fitted with side extension pieces, obtainable from most accessory dealers, should be suitable, and are quite inexpensive.

CHECKING THE VALVE TIMING.

My late 1919 single-cylinder Rover gets overheated and knocks prematurely. I have decarbonised it and find that the bearings, etc., are perfect. Recently I had the engine retimed according to the makers' diagram, and find that the inlet valve opens about $\frac{1}{4}$in. down. The exhaust closes about $\frac{1}{32}$in. before top centre. Will you give me the actual distances required, measuring from the piston top, so that I might check the valve opening and closing? I already have the manufacturers' timing diagram, but have not got perfect results.—G.B.

To get the required distances draw a full-sized diagram of the crank path (i.e., an 88mm. circle) and the cylinder axis, and on this set off the connecting rod length (which you would get by actual measurement on the engine) at the various crank positions required. The timing you give certainly appears to be unusual, and in any case we would advise you to reset and try the following: Piston on top dead centre, exhaust just closing and inlet just commencing to open. Ignition should be timed so that the contact-breaker points just separate when the piston is on top dead centre of compression stroke, the magneto control being two-thirds retarded.

A TINY ENGINE.

I have a "2 h.p." Humber four-stroke motor cycle which overheats very quickly after about a mile or so. Could you tell me a remedy for this trouble, as the engine is in perfect condition? Is this small engine any good or not?—T.A.

The small single-cylinder Humbers of 1913-1914 are quite good little machines, but of course the power is low. At the same time, however, your machine should answer quite satisfactorily for runabout purposes in a level district. Without having more particulars of the engine it is impossible to tell you the cause of the overheating, but it may be due to belt slip, late opening or early closing of the exhaust valve, permanently retarded ignition timing, or an air leak, possibly at the inlet valve stem. Attend to the tappet clearances; note if cams are badly worn and renew if necessary and verify the correctness of working of the lubricating system.

EXPERIENCES WANTED.

Readers' replies to questions published under this heading should be addressed c/o The Editor, "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4, when they will be forwarded direct to the querists concerned. Requests for experiences should be accompanied by a stamp.

W.W. (Barnsley).—Binks three-jet on 994 c.c. Matchless sidecar.

J.M. (Dunbar).—398 c.c. spring frame Royal Ruby.

"A.E.W." (Birkenhead).—Showell or other automatic lubricator on 398 c.c. A.B.C.: cost of fitting and mudguard clearance if fitted to magneto shaft.

"R.A." (Liverpool).—499 c.c. Rex-Acme: steering and stability.

"H.T." (Buxton).—398 c.c. A.B.C.: fitting of oversize tyres and Cox Atmos carburetter.

"W.P.S." (Surbiton).—596 c.c. Indian Scout: performance with sidecar, primary drive.

"J.W.F." (Wallasey).—398 c.c. A.B.C.

"G.L." (Manchester).—398 c.c. A.B.C.

SPARKLETS.

Fork Shock Absorbers.

Victor Horsman has recently been using B. and D. stabilisers on his Druid front forks with conspicuous success in his successful Norton record attempts at Brooklands.

Found.

On the Bath Road, near Hounslow, Indian kick-starter (Ref. No. 115).

On the Romsey-Winchester Road, lady's hat from sidecar (Ref. No. 116).

On the Kingston Road, Staines, a road map from a (?) 350 c.c. Sunbeam (Ref. No. 117).

Price Correction.

Owing to some misunderstanding, the price of the 346 c.c. Humber was given in our Show report as £55. The actual fixed price is £65.

Spring Fork Lubrication.

By the provision of grease cups, which are a great advance over the old type of lid lubricator, Brampton spring forks have been considerably improved.

A Successful "Failure."

In our report last week of the pre-Show activity at Brooklands, mention was made of the failure of Hawke's Anzani engine as his Morgan flashed successfully over the timing line. It has since transpired that what happened was merely a fracture of an excessively lightened alloy piston.

A Sporting Offer.

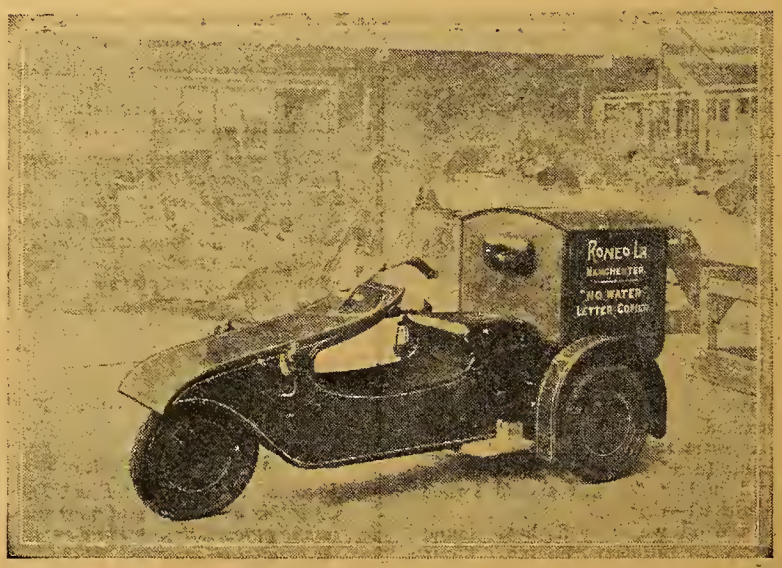
Well known and popular in the competition world, Mr. F. Olai, of Amac carburetter fame, is of Swedish origin, and he has already offered his services to the A.C.U. in connection with the 1923 International Six Days Trials which are to be held in his native country.

To Prague by Road.

During last week-end two brave Czecho-Slovakians, A. Sulc and F. Nusl, left the B.S.A. Birmingham works on a B.S.A. sidecar outfit for Prague in an endeavour to get there in the shortest possible time. Their transport arrangements (*via* Dover and Ostend) have been made by the A.C.U. They are agents for the B.S.A. and A.J.S. machines in Prague.

Toggle Link Chain Punches.

We have been asked to make it clear that the Coventry Chain Co. does not now make a chain rivet extractor embodying the principle of toggle links, an earlier patent for this system having been granted to the firm of Saxelbys, Ltd., of George Street, Coventry, which now, of course, markets an improved tool of this nature.



FOR LIGHT DELIVERY. By reason of its excellent performance, ease of handling and simple construction, the Harper Runabout lends itself readily to a variety of light trade purposes. Efficient springing allows safe carrying of fragile goods.

1923 BINKS 3-JET CARBURETTOR

CONTROLLED BY A SINGLE LEVER

increases the speed of a machine and greatly adds to the pleasure of driving, owing to the remarkable flexibility of the mixture. Whilst in traffic the owner has a real sense of control over his machine, and can drive slowly or get away at will without any fear of stopping his engine or causing it to race.

THE PATENT 3-JET DAMPING SYSTEM USED ONLY IN THIS INSTRUMENT WILL SAVE AT LEAST 25% OF YOUR PETROL BILL

The carburettor contains a real extra air valve to allow you to coast down hill on pure air.

Any machine, however old, erratic, or extravagant, can be transformed into a docile, powerful, and economical machine to the surprise and delight of the owner.

Please write or ask for interesting catalogues. **Price £4 and 2/- postage.** *Sold on Approval.*

IF YOU ARE ORDERING A NEW MACHINE SPECIFY THE NEW BINKS 2-JET 2-LEVER CARBURETTOR.

It is wonderfully flexible—starts easily—makes even the most sensitive twin tick over slowly—and has a wide range of speed that is unexcelled. Several first-class manufacturers have shown their appreciation of it by fitting as standard, and many makers will fit it by request without extra charge.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words 3/-, and 3d. for every additional word. . Paragraphs of under 8 words are charged double rate. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable & Co. to ILIFFE & SONS Ltd., and crossed Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle" by the first post on Friday morning previous to the day of issue. Advertisements that arrive too late for a particular issue or that are crowded out will automatically be inserted in the following issue unless accompanied by instructions to the contrary.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue on which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4. *Readers who reply to Box No. advertisements are warned against sending remittance through the post except in registered envelopes; in all such cases the use of the Deposit System is recommended, and the envelope should be clearly marked "Deposit Department."*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the machine offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor. Carriage is to be paid by the buyer, but in the event of no sale each party pays carriage one way. The seller takes the risk of damage in transit. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, ½%. All deposit matters are dealt with at Dorset House, Tudor Street, London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

A.B.C.

The Sign of G Good Service

THINK IT OUT.

Thousands will join the ranks of motor cyclists this Season because prices have not only been reduced to zero but are stabilised.

It does not require a prophet to foretell an early shortage of machines.

Our advice is to order now—for forward delivery if you like,

BUT ORDER NOW.

Send your suggestions now for the

GREAT BURLINGTON COMPETITION

in which we are presenting this

2¾ h.p. Burlington Douglas

Fully Equipped

FREE

TO further popularise our well-known Sidecars, we have instituted the following interesting competition, in order to obtain a really good slogan for these Sidecars.

NOTE.—The type of slogan required is something similar to "Luxury Products at Economy Prices," or "Best on the Long Run."

All that is necessary is to send in your suggestion for a slogan, accompanied by an order for goods to the value of not less than 2/6.

Every 2/6 entitles you to send a suggestion.

An abbreviated List of spares and useful accessories will be found under our advertisement in the Miscellaneous columns.

BURLINGTON SIDECARS

renowned for their distinctive design, their elegance, and their roomy comfort. Can be supplied on Cash or Easy Terms.

May we send you a catalogue?

BURLINGTON MOTOR CYCLE CO., Ltd.,

"Splendid!"

— yet another striking tribute to

Stepney

"Road-Grip" Tyres

Read the following from a "Morgan" owner :—

"The Leasows,"
Bunt Green,
Birmingham.

Dear Sirs,

I had a Stepney Road Grip Tyre on the back wheel of my Morgan and it did over 5,000 miles and then I put it on the front wheel for about 1,000 miles **and it never burst** but just wore through the canvas. **They are splendid.**

I have tried one of the supposed best make of Cord Tyres and it burst under 1,000 miles, so I have gone back to the make (Stepney) Tyre on my Morgan.

Yours truly,
E. HEADLY BAYLIS.

P.S.—If any one does not believe my statement I have the old Stepney (6,000 miles) to show.—E. H. B.

ASK YOUR GARAGE MAN ABOUT THEM!

MOTOR CYCLE SUIT

With Plaited Leather Belt.

GUARANTEED WATERPROOF

SPECIFICATION

MADE from hard-wearing double texture fawn material with an interlining of Rubber. Double Breasted Jacket, with all-round Belt and Leather Buckle, large Patch Pockets, and converted collar to button right up to neck, to fasten with Throat Tab. Wind Cuffs in sleeves. All seams of the Suit are rubber cemented and taped with extra material, making the garment absolutely waterproof. Overall Trousers with spat-shaped leg; wind gussets to keep the wind from the leg and boots; fastened with patent clasp fasteners, enabling the trousers to be pulled off in a moment. The suits are newly manufactured, and every care is taken with details so that the garment will meet the severest test. We give full guarantee that this suit is thoroughly waterproof and impervious to the most drenching & continuous downpour.

THESE SUITS ARE NEWLY MADE FROM FRESHLY PROOFED MATERIAL BY EXPERIENCED WORKMEN, AND NOT HALF PERISHED CLEARANCE LINES OR W.D. SURPLUS

RELIANCE Magneto Repairing Co.

RELIANCE for Repairs, new magnetos, and spare parts of every description.

RELIANCE have the largest and most up-to-date repair factory in London or Provinces.

RELIANCE carry out all repairs on the premises, including armature winding. Trade inquiries solicited.

RELIANCE have one of the most modern armature-winding plants and test rooms in the country, and can therefore offer you the following advantages:—

TIME.—All work within 6 to 48 hours, and a solid 12 months' guarantee in writing to back it up.

CHARGES.—No flat rates. You are charged according to the work that is required; therefore you are not in some cases helping to pay for other people's repairs.

OUR Offer.—We shall be pleased to allow you to see your magneto on test after repair at our works. How many others can make the same offer?

RELIANCE have the following magnetos in stock, all fully guaranteed and on approval.

THOMSON-BENNETT.—Singles and twins, new, any degree, waterproof, variable, suit any engine; price 55/-.

C.A.V. Singles and Twins, new, ideal for any lightweight, 2¾h.p. and 4h.p. Douglas; 55/-.

BOSCH, Type Z.A.2, second-hand, enclosed, waterproof, variable, latest pattern, for Douglas 2¾h.p. and 4 h.p.; £4/10.

ACCUMULATORS, best makes only, for all purposes, any voltage, charged and uncharged, always in stock; send for prices.

BOSCH Enclosed, waterproof, type D.A.L. magnetos, Government surplus, any degree, ready to fit on Indian, Harley, J.A.P., or any big single or twin. We guarantee these to give you slow running and easy starting, and they are in every way ideal for the big machine; price, carriage paid, £4/10.

GUARANTEE.—Every magneto, no matter what the price or make, is guaranteed by us. Not merely that same is in good order at time of sale, but a plainly written statement that we guarantee each machine against all defects for a period of 12 months. This, we maintain, justifies us in charging a few shillings more than certain of our competitors. List sent post free upon application.

RELIANCE were established in 1914, since when we have enjoyed a reputation which is second to none for straight and fair dealing.

RELIANCE Magneto Repairing Co., 283, St. John St., London, E.C.1. 'Phone: Clerkenwell 4290. T.A.: Remageo, Smith, London. [2226

IGNITION, LIGHTING, ETC.

MAZING Offer.

OUNTY of London Engineering Works, Ltd.

VE hold the largest and most varied stocks of magnetos and spare parts in England, our stocks aprise of over 30,000 magnetos, and an inside esti-te of our spares is £250,000.

VE would bring to your notice that these magnetos are not old disused magnetos painted on the out-e to look like new, like many being offered to the blic by so-called magneto specialists and experts, but new unused Government surplus, and every magneto vious to being sold is thoroughly overhauled, and jected to the same test as by the makers.

UARANTEE.—These magnetos are all fully guaran-teed for 12 months against all defects, and should magneto at any time within this period prove in way defective, we will willingly exchange or repair le free of all charge.

PPROVAL.—Notice all goods sent on approval for 14 days, per return of post on receipt of cash, l in the unlikely event of these goods not meeting h your entire approval, we will willingly refund cash full making no deductions for packing or carriage. gnetos despatched through this paper's deposit system required.

IGNITION, LIGHTING, ETC.

MAGDYNAMO Engineering Co., Ltd., for magnetos, spares and repairs.

MOTOR Cyclists fit reliable high quality magnetos now and avoid certain failure of inferior magnetos.

BOSCH Enclosed Waterproof Type D.A.L. Magnetos, Government surplus, ready to fit on Indian, Harley, J.A.P., or any big single or twin, gives powerful spark at all engine speeds, makes your engine a real live engine, give you easy starting, smooth and rapid acceleration, high speed, and low fuel and oil consumption with increased power; price only £5 each, postage 1/6 extra; a 12 months' written guarantee sent out with each magneto. We give you satisfaction or refund cash.

PLEASE note the above type magnetos were originally manufactured for 200h.p. aircraft engines; therefore we have every confidence in claiming them to be the magneto you require for your big machine. Fit one to-day, and see life with a live machine.

HARLEY-DAVIDSON Owner writes: "Magneto to hand; many thanks for prompt despatch, satisfactory in every way; will recommend to my friends."

ZENITH Owner writes: "Since fitting magneto have completed a run of 250 miles; highly satisfied; will certainly recommend these magnetos."

INDIAN Machine Owners.—Your high-class machine deserves a high-class magneto. We want 1,000 Dixie 42° magnetos; send your magneto and £4 now, and we will immediately despatch you a Bosch D.A.L.

READY to fit on your machine; there are no alterations to make.

WHY is it that the leading Motor Cyclists—the men who know—are almost all sending to us for their Magnetos?

THERE must be a reason; there is; it is because the Magnetos of quality and guaranteed service, supplied by Magdynamo, beat all other Magnetos.

MAGDYNAMO will take your old Magneto in part payment.

REMEMBER your magneto is sent on 14 days' approval against cash per return on receipt of your order; there is no obligation to keep it until you have used it for 14 days on your machine and are satisfied; let us send you one now.

ARE You a Discerning Douglas Owner? Do you want a reliable magneto with 12 months' guaranteed service that will give you starting without worry, a smoother running, and more powerful engine and better results from your Douglas? Then send for a lateat enclosed waterproof type Bosch XA2 magneto now; price only £5, carriage 1/6.

C.A.V. Magnetos (not converted starters), ready to fit on Triumphs, B.S.A.'s, Nortons, and P. and M.'s, with 12 months' guaranteed service, price £3/10, carriage 1/6.

THOMSON-BENNETT Magnetos latest enclosed waterproof type (not converted starters), ready to fit on 55° Clyaos and 180° Douglas machines, with 12 months' guaranteed service, price £3/10, carriage 1/6.

MOTOR Cycle and Car Owners, are you testing all your sparking plugs properly? Are you wasting pounds yearly by throwing away good plugs? Fit a Bosch aeroplane hand starter magneto on your garage bench to-day and always have your sparking plug tester at hand, price £2, carriage 1/6.

TRADE discounts and export quotations.—Write, call, or 'phone for terms.

A YEAR'S guarantee on repairs. Before you scrap that magneto, whatever its condition, let us see it; we will rebuild your magneto to look and work like new, no matter what make, within 3 days or 24 hours if urgent, and return it with a written 12 months' guarantee. While your magneto is being repaired we can lend you another free of charge. We could not make these offers if we were not certain of the quality of our work.

YOUR old magneto will be equivalent to new at a low cost. Send us your defective magneto now.

EXPRESS Dixie Repair Service. Your Dixie magneto, no matter what size, rebuilt equal to new and returned in 12 hours, at 30/-; a small extra charge for necessary replacements.

C.A.V. Express Repair Department.—Your C.A.V. magneto, no matter what type, rebuilt equal to new and guaranteed for one year, returned in 12 hours, at 30/-; a small extra charge for necessary replacements.

ARMATURE rewinding, no matter what make, type, or size, 11/6. Wound cores from stock.

IT'S not what you pay, but—what it pays you that makes your magneto and dynamo overhauls cheap. If you want high-grade magneto and dynamo repairs that pays you send your faulty machines to us.

MAGDYNAMO for quality.

BEAVER! Beaver! Beaver!—A postcard will bring you particulars of our famous Beaver mascot for all types of cycles, combinations and cars.

Sheen Park Lawn Tennis Club,
Dear Sir, May 22nd, 1922.

I am instructed by my Committee to say they are very pleased with the Pavilion you erected for them.

Yours faithfully, JOHN O. GRIFFITS.

122, Shortlands Road,
Sittingbourne, Kent.
August 17, 1922.

Mr. Brodrick,
The South-Western Appliance Co.

Dear Sir,

The St. Helier Building arrived on Saturday, two days before promise of delivery, and we are more than satisfied with it.

We erected it on Wednesday and it went together like clockwork. I am very pleased we left the order with you, as all who have seen it think the value is remarkable and admire the artistic appearance. Trusting and believing it will get you further orders from this district.

Yours faithfully,
THOS. E. KENNETT.

The Show in the Balance.

IN trade circles discussion is rife as to the desirability of a Show every year for motor cycles and accessories. That the public is distinctly interested in the annual Show of motor cycles is amply demonstrated by the crowds which regularly throng the stands.

On the other hand, it is felt by a section of the trade that an exhibition every two, or even three, years would prove of distinct relief to manufacturers in the matter of expense; it is also contended that a Show curtails sales during the autumn months by reason of prospective buyers postponing their orders "until the Show." No decision has, of course, been made, but the matter is one which will be seriously considered by the Motor Cycle Manufacturers' Union in the near future.

Our own view is that an annual Show is of incalculable value to the movement. Now that motor cycles have reached such a high state of perfection, propaganda among prospective owners is what is most desired. The very fact that so many visited the recent Show is in itself evidence of the appreciation of the public of the opportunity to examine side by side and so compare the scores of makes and types of motor cycles available. The Show, too, is an annual re-union of private riders as well as agents from all parts of the country—even the world—and the cancellation of such an opportunity to get together in the Metropolis would be in every way regrettable.

A Show of the importance of Olympia is in itself a magnificent tribute of the strength and stability of this large and ever-growing industry; it is, too, a harbinger for the following year. To break away from the annual series would convey an impression of weakness with which the movement most definitely should not be saddled neither at home nor abroad. It has been found in the past that a manufacturer can more conveniently gauge possible demand in the succeeding year by an exhibition in October or November, and so during the winter months better arrange his plans for the busy season. Without a Show there would be no starting-off mark, so to speak; instead one would see new models introduced all the year round, so perplexing the buyer, who would be afraid of purchasing a particular model lest a newer or later edition be produced unexpectedly soon after his purchase.

At the present time a buyer knows and appreciates that a machine purchased subsequent to a Show represents the succeeding year's current model and has more faith in placing his order on that account.

Who's Who in the Motor Cycle World.

THIS issue contains the second instalment of a feature which was introduced last week: "Who's Who in the Motor Cycle World." Names are constantly recurring in our pages of persons who are prominent in the motor cycle movement, either in an official capacity or as actual participants in the sporting and competitive fields, and it is to satisfy the general reader as to who and what manner of men they are of whom he reads—from whence they hail, their ages, their activities in other spheres of life and their hobbies—that the series has been commenced.

Our aim is to include everyone of any note at all, and the necessary material is being collected unceasingly. All past and present competition riders who have been or are in any way prominent will be included, as well as all whose official duties have made their names household words in the motor cycle world.

An index to the advertisements in this issue will be found on the page facing the back cover.

Occasional Comments:

by "IXION"

The Pramotor.

I NEVER take ladies to motor exhibitions. They ask such silly questions. Not of me. They know better than that. But of the stand attendants. Who look sympathetically at me, while they explain. I resent sympathy from dudes unknown to me. I had to break my rule at last month's Car Show. As a peace offering. I had been detected in something, and this was my ransom. So we went. I led her straight to the Dunkley Pramotor. (Knew I'd got to buy her something after what had happened, and thought a Pramotor would be cheaper than a Rolls.) No luck. Not a bit of it. One disdainful glance, and I was dragged off to study the 50 h.p. Sizaire-Berwick. Her expert opinion is that Mr. Dunkley is either a bachelor or a grandfather. At least, he knows nothing about babies. I hadn't noticed it before, but it is true. The bisected scooter on which Nursie stands is at the *back* of the Pramotor. Screened from the infant's view by the rear leather panel of the saloon. So that Baby can't see Nursie. Now, when our *n*th Ixionette loses sight of Berenice (Berenice is our nurse) even momentarily, it makes a noise compared to which the last trump intensified through a Magnavox is the first bleat of a young lamb. (I compromised with a Trojan saloon eventually.)

Technical or Financial?

EVERY good motor cyclist has noted the fact that successful cycle cars are as scarce as auks' eggs. It is generally held that the technical problems are responsible. There is the Morgan and the G.N. Hardly any other cycle car has held its market for a long term of years and brought gladdening "divis." to its parent brain. Perhaps finance is quite as strong an element in the selectness of the cycle car ranks. The plain fact is that the profit on a £100 proposition is at the best small. On the other hand, the disgruntled buyer of a £100 cycle car can give a manufacturer quite as much trouble as the buyer of a £1,000 car. In fact, it is long odds that the former will give much more trouble. For he will *have* much more trouble. In a high-souled world there will ultimately be found a man who, seeking to employ his brains, cash, and plant, will select the opening which offers the maximum difficulty and the minimum profit. But great souls are particularly scarce in these post-war days.

"Ixion's" "MOTOR CYCLE REMINISCENCES" are available in book form, price 2s. 9d. post free, from "The Motor Cycle" Offices, Dorset House, Tudor Street, E.C.4.

Some Day.

HOWEVER, as the small engines become impregnated with ever more and more ginger I foresee the tardy advent of tiny four-wheelers, in which a lath chassis supports a 500 c.c. engine and transports two people with speed, economy and comfort. I hope it will come in my time. It would be so jolly to have a pure utility 'bus which one could keep in the garden, lend to a neighbour, let the children play with, and have as a permanent reserve for one's real motor. At present one can't do it. The simplest affair costs too much. First price, tax, insurance, etc. But if ever we can get this sort of layout at about £50 new, and £25 second-hand, it would serve the really poor as their one and only motor, and the class who can afford to own more expensive vehicles would keep one in general reserve. It sounds impossible, I dare say. But you know the Ford used to cost £77 f.o.r. Detroit; and club talk ran to the effect that of the £77 a third was profit, a third salesmanship costs and overhead charges, and a third was actual material and labour costs. Allowing for errors in this public guess, it is still not absolutely outside our dreams that a simple little lath-and-string cycle car of modest durability may eventually arise at £50 net cash.

Occasional Comments.—

Two Snags.

IN the meanwhile, our sidecars and cycle cars are alike so good that it is rare to hear the most jaundiced critic make any but two complaints. The one ineradicable weakness of three-wheelers is their lack of driving grip on freak hills; this is a very pardonable shortcoming, for only sports maniacs really want to climb shale slopes with a grade of 1 in 3, and on all rational roads the single driving wheel has loads of grip. It may not be so in the Colonies, and perhaps we may yet see the sidecar with two driving wheels developed for overseas use. The other complaint is that the driver of a sidecar resembles a parrot on a perch, and that in winter time such a position is not good enough for anybody over eighteen years of age. But even this is being met. Mr. Easting has a really nice driver's screen; I am using one at the moment. The B.S.A. people have a sort of gun-shield, behind which one can grin at a blizzard. And the T.O.M. concern is busy with a protection system designed to let one ride in a lounge suit through a British winter. This small snag will never seriously interfere with the future of sidecars.

Standardise the Dynamo.

MY own chief ambition for the motor cycle industry as a whole, and *à fortiori* for the passenger trade in particular, is that lighting dynamos should be standardised. The utility era is upon us, and no vehicle is utilitarian until it can conveniently be used *at night*. Now it is indisputable that the bulk of our motor cycles very seldom take the road after dark. Their illumination is largely to blame. Gas lighting can be perfectly efficient and perfectly reliable; it is not always either in unskilled hands, and in anybody's hands it entails work. The dynamo system is efficient, reliable, and automatic. Finance is the sole cause of its still very limited application. Dynamo lighting is an expensive extra. When you sell it you get next to no consideration for it. Nor can you easily transfer it bodily to your next machine.

Two Remedies.

THERE are two obvious ways of dealing with this regrettable situation. The first is to cheapen dynamo sets till they cease to be an expensive extra. This has long since been done in America, where dynamo sets add very, very little to the cost of a machine and are of reasonable quality, if still below British standards. The other is to take steps to render a dynamo lighting set easily and completely transferable from one machine to another. The former method is obviously preferable, as well as easier to carry out. I would not emphasise these crying needs if the demand were impossible. But the failure to offer electrical equipment of a standardised character at a rational price is a big factor in strangling our exports. Moreover, if it be true that motor cycling is becoming daily more utilitarian, the first electrical firm to cheapen its equipment will profit enormously, and the first motor cycle designer to allow for easy dynamo transfer will also improve his sales. Already I know of riders who are adopting this system on private lines. I say to Smith, "You should try a Blizzard next year; they are very good now. He replies, "No, thanks, old man. I shall be on Whirlwinds for three or four seasons now. You see, I've fitted a £20 electric set to my 1922 Whirlwind, and I can shove it on to the 1923 model straight off."

A TOKEN OF GRATITUDE. Probably most London motor cyclists have passed this monument on the Embankment without knowing much about it. Actually it was erected by Belgian refugees in grateful appreciation of this country's hospitality during the war.

Sidecar *v.* Cycle Car.

FROM all I had been told, I went to the Car Olympia prepared to purchase crape bows wherewith to decorate the superseded sidecar at the Motor Cycle Olympia. I returned much refreshed in spirits. So far as new cars go, there is nothing to threaten even the 1,000 c.c. outfit *de luxe* as yet. Our 1923 prices are putting the biggest sidecars out of the danger zone in which serious competition need be feared from any brand new car. Certain second-hand small cars will unquestionably be available at less than new sidecar prices in due course. But a very cheap car is a dubious second-hand bargain. It was generally somebody's first car. He bought his experience on it, and I shouldn't like to buy the fruits. Moreover, the performance of these little miseries is not comparable to motor cycle performance. I do indeed know a man who set out in cold blood to drive from Brighton to Liverpool on one of the cheap small cars which are alleged to be formidable rivals of such superb monsters as the big Matchless. He survived to tell the tale, and he made the return journey as well. Sixteen m.p.h. average, and half an hour's wait to cool the engine at the top of several hills. Any 500 c.c outfit would have done better. So long as there is red blood in English youth, the sidecar will sell freely against the cheap car, and if we lose a few old gentlemen to the car trade their grandsons will re-fill the ranks.

An Autumn Trip

A Family Outing. Speed Sensations and Real Speed. Pillion Comfort.

By "AURIGA."

IT is not often that one can lunch in comfort by the side of a brook in the British Midlands when November is well advanced, so that it is well to take advantage of such opportunities when they present themselves.

It so happened that I had the loan of a 499 c.c. Rover and sidecar, so a family party of five set out for a run into the country, three and a spaniel on the sidecar outfit, and the other two on an A.B.C., a cushion having been placed on the carrier. A start was made from the neighbourhood of Coventry, not too early, and our objective was Weeford, a pretty village situated on the famous Watling Street, which is part of the London to Holyhead road, about three miles from Lichfield.

We left the main road at Stonebridge and made for Coleshill over a road crowded with motors.

Speed—Real or Estimated.

After passing through Coleshill we overtook two solo riders who, by means of a total indifference to the rules of the road, kept ahead for a time. Presently this became a nuisance, and though I do not race on the public roads, I opened my throttle a trifle and slipped by. One of the riders called out something as I passed, so I slowed up to find out what he wanted. When he came up he asked me how fast I was going when I passed him. The speed was but moderate, and I had not noticed the speedometer reading at that moment. After letting him lead for a minute or so I again quickened up, and, keeping an eye on my Bonniksen, called out to him that we were then doing 35 m.p.h. "Fifty-five," he said in a pleased tone. "No," said I, "thirty-five," and, quickening up to forty, I went ahead, and saw no more of him or his friend.

This little story has a moral, which is that speed is not always as reported. My chance acquaintance was apparently quite ready to believe that he was doing fifty-five when his speed was in reality 20 m.p.h. less than this, and my opinion is that many riders who talk glibly of sixty and seventy miles an hour have really no conception of what fifty means on an ordinary road. If every motor cycle had an accurate speedometer there would, I am sure, be fewer claims of 40-50 m.p.h. averages from experts or novices.

At the start with the A.B.C. and Rover sidecar.

Roads.

At the Bassetts Pole we left Warwickshire and entered Staffordshire, and the roads immediately changed in their quality. Warwickshire roads have been the subject of much abuse of late, and not altogether undeservedly, for in some places they are atrocious, but on this particular route they compare very favourably with those of

An Autumn Trip.—

the next county. For the most part they are tarmac and have an excellent surface, while the Staffordshire roads hereabouts are loose and rough.

In this connection it is interesting to note that a plain felt cushion on the carrier of the A.B.C. made a more comfortable seat than a spring seat on the sidecar machine. This is no reflection upon the general comfort of the Rover or its sidecar, for both were most comfortable (N.B.—The Rover was equipped with a Brooks cantilever saddle), but it illustrates the difference from the pillion rider's point of view over a rough road—and it was in Staffordshire that the difference was most noticeable—between a solo machine and a rigid sidecar outfit. The A.B.C. has, of course, a spring frame, but the carrier is not sprung, so this makes no difference. The reason is, I think, to be found in the sideways movement of the sidecar outfit when the wheels, either of the sidecar or bicycle, strike potholes, and in the greater difficulty of avoiding unevennesses of the road when two tracks have to be considered.

The Rover had a heavy load, but in spite of this showed plenty of speed and hill-climbing ability, and its steering is remarkably good. Some sidecar outfits have a powerful tendency to pull one way or the other, but the Rover was entirely free from this, and steers as easily as a solo machine.

USING THE EXHAUST VALVE LIFTER.

Notes on an almost Forgotten Habit. Securing Piston Ring Lubrication.

By H. MORTIMER BATTEN.

IN these days of decompressors and efficient kick-starters, the exhaust valve lifter becomes more and more a back number.

At one time it was the hinge on which our lives swung, and I remember well, in the salubrious town of Northampton, knocking the hind legs clean from under a burly dray horse through a broken exhaust valve wire.

In those days exhaust valve wires invariably broke, chiefly because they did more work than anything else barring the engine and the rider. And when an exhaust wire broke we proceeded on our way in dire peril. I remember thinking a friend of mine no end of a hero because he rode fifty miles with this vital accessory inoperative. So he was. To-day no one cares if an exhaust wire breaks. I have ridden for months with it removed from my present machine because the convenience it afforded was not worth the trouble of re-soldering the nipple.

Tradition, however, dies hard, and a great many riders still regard the exhaust valve lifter as a means of controlling the engine.

On Down Grades.

This practice was widely discouraged in the Press, despite the fact that not so many years ago it was customary always to recommend the use of this fitting on down grades—a practice which is excellent if intelligently done. Its internal cooling effect is great, and the exhaust valve lifter can safely and advantageously be used if the carburetter levers be so set that the engine does not pop repeatedly during the idle periods. This, of course, can be avoided by the use of a switch, and with a very sloppy piston oiling up can be avoided if the rider resorts to the exhaust valve instead of closing the throttle. With an overloaded low-powered rather ancient machine it is certainly advisable in a hilly country to raise the valve whenever distance makes it worth while, but normally, with present-day engines, it is quite unnecessary.

The best plan is first to close the throttle and let the engine pump over for about forty yards, then to raise the exhaust valve. This is good from a lubrication point of view, besides which it allows the valve to cool a little before it comes in contact with the outside air. As a matter of fact, the valve does not immediately come in contact with cold air when lifted, as many writers have argued. With the throttle closed the engine merely partially displaces the hot air in the exhaust and silencer and draws it back and forth, so that the cooling effect is graduated and moderated and is not violent until the exhaust pipe and silencer have cooled, by which time the valve also has dissipated a good deal of its heat.

With a Tight-fitting Piston.

With a new engine it is not advisable to use the exhaust valve—or, rather, it is beneficial to control on down grades by the throttle. A new piston is very apt to dry up unless subjected to periodical doses of oil. By closing the throttle at regular intervals one creates a partial vacuum in the cylinder, which has the effect of sucking the oil up to the top ring. Thus a new tight-fitting piston is very apt to grip unless, at intervals, the throttle be closed, and this drying up of the pistons more often occurs with a new car—despite excellent lubrication systems and water cooling—than it occurs with a motor cycle, for the reason that the motor cyclist periodically "stops" his engine by closing the throttle, thus causing oil to be sucked up the cylinder walls, whereas the car driver attains the same end by removing his foot from the accelerator pedal and placing it in the clutch, leaving the engine to tick over on its own instead of being dragged round against the vacuum of its own creating.

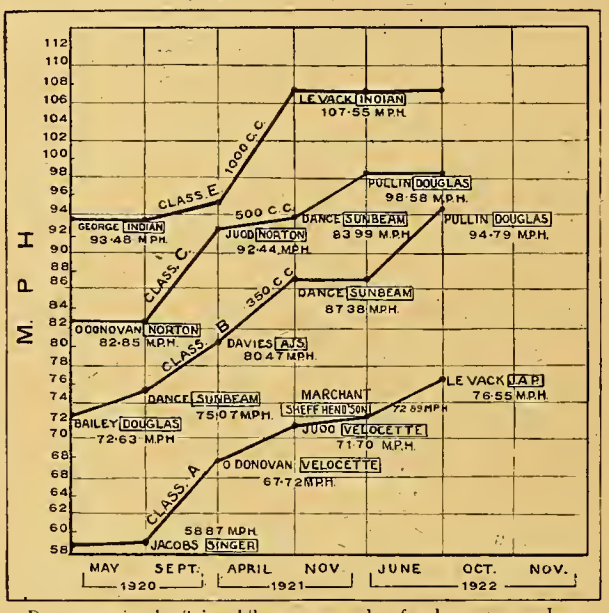
Summing up, then, it would seem—at any rate from the writer's viewpoint—that with an old machine—especially if it be overloaded, as so many old machines are, it is advantageous to use the exhaust valve lifter whenever possible, but that a new machine calls for and expects that overdose of oil which can be obtained only by closing the throttle. Needless to say, all speed regulating should be done by the carburetter, as otherwise one obtains a very snatchy, uneven drive, which is bad for the tyres and the transmission, and which much enhances the likelihood of skidding

SPEED AND PROGRESS.

Record Lists as an Index to Engine Development. Track Riders' Forecasts for 1923.

THERE can surely be no clearer proof of the improvement which is taking place in motor cycle engines than is afforded by a study of the record lists, past and present. These valuable lists are compiled by Mr. A. V. Ebblewhite, the well-known time-keeper, who has officiated with the watch at practically every record attempt.

A comparison of post-war record lists with those of pre-war days reveals very clearly the reason for the hold which the small machine has latterly obtained upon the popular fancy. Increased speed upon the track is the forerunner of more efficient touring machines. Brooklands has been the testing ground for every improvement in engine design; the vast expanse of concrete is a hard teacher, but it does its work thoroughly. It deals harshly with bad design, and with poor material, but it has been largely instrumental in keeping the British motor cycle ahead of its rivals.



Post war rise in flying kilometre speeds of solo motor cycles.

A Fallacious View.

"Speed," says many a motor cyclist who likes to consider himself a hard-headed business man, "is all right for the madman who wants to tear about the country at 60 miles an hour. All I want is a machine that will get me about at a reasonable speed. What I need is reliability, pure and simple." Maybe. Reliability is undoubtedly the best asset any motor cycle can have; but surely a machine which has been proved capable of sustaining 60 m.p.h. for twelve—or for twenty-four—hours can be considered more free from liability to defects, such as broken valves, weak frame, warped cylinder, or stripped gears than another, the sponsors of which hesitate to submit it to such a gruelling test? Not for publicity alone does the average manufacturer indulge in track work; rather is he endeavouring to prove that his design is right, and, if it is not, to discover its weak points, later to rectify them on his standard production.

The charts which accompany this article demonstrate very clearly the manner in which the speeds of the various classes have yearly tended upwards. Observe how the graph denoting each engine capacity has encroached on the past maximum speed of its bigger neighbour, until to-day the small machines are attaining speeds which were out of the reach of their bigger brethren a year or so ago.

Admittedly, the maximum speed records are not a true reflex of the capabilities of "standard" type machines. The majority of these record speeds have been attained over a comparatively short distance, although it should be noted that no record of less than one kilometre ($\frac{5}{8}$ mile) is officially recognised so far as motor cycles are concerned. Favourable weather conditions, too, have played no inconsiderable part in the putting up of maximum speed records, and it is an undoubted fact that the mean speed records are a much fairer criterion of a machine's real performance. Mean speed records, however, were not instituted until 1921, so that no comparison is possible with similar achievements of earlier date. Nevertheless maximum speed figures are interesting as showing the highest speeds which have yet been attained over a distance officially recognised for records.

Maximum speeds of sidecars over the flying kilometre.

108·68 m.p.h. for 5 miles.

It should be pointed out, however, that the world's record speed for any motor cyclist still remains the property of America. It is 108.68 m.p.h., and it was accomplished by E. Walker on April 14th, 1920. Walker's machine was a 998 c.c. Indian, and the speed mentioned was that at which he broke the five-mile record at Daytona Beach, Florida. The course was, naturally, dead level, and of perfect surface; somewhat different, be it noted, from the conditions obtaining at Brooklands. All credit, however, to

Speed and Progress.—

Walker; remember, he put up this record over two and a half years ago, when the highest speed standing to the credit of any British rider was 93.40 m.p.h. It is sufficient that, the record having passed the stringent scrutiny of the F.I C.M., the conditions under which it was made may be taken as satisfactory.

Strenuous Testing.

Very little reflection is needed to make it apparent that there is no surer test of reliability than that constituted by sustained speed. For short-distance record-breaking, machines may be somewhat freakishly tuned; pistons, connecting-rods, valves, timing gear, etc., may be lightened to perilous limits. Not so, however, for long-distance record attempts. To pound round the track at full throttle, hour after hour, demands sturdy working parts combined with efficient design. Nor is the surface of Brooklands track so smooth that no jars are imposed upon the frame, wheel spindles, etc., while the long-continued strain of transmitting the drive is not without some testing effect upon the clutch and gear box.

There is but one successful continuous twenty-four-hour record attempt recorded in England; it is that of Harry Collier at Canning Town track on May 5th and 6th, 1909. Collier used an 862 c.c. Matchless-J.A.P., and his average speed throughout was 32.32 m.p.h. As most people are aware, it is not possible to attempt a similar run upon Brooklands track, whilst, taking into consideration the fact that Collier alone rode the machine throughout the whole period, and that several hours were those of night, it is not practicable to compare this achievement with any of the recent "double twelve" and "triple eight" hour records. Two "double twelve" hour records made this year deserve mention, however; one was that of Horsman,

RECORD STANDING END OF 1919
JUNE 1920 NOV. AUG. NOV. 1921 JUNE OCT. 1922 NOV.

Upward trend of the solo hour records since 1919.

Judd, and O'Donovan on a 490 c.c. Norton at 60.31 m.p.h., and the other was that of Pullin and Marvin on a 350 c.c. Douglas and sidecar at 41.76 m.p.h. Of course, the machines were not allowed to be touched between each twelve-hour period.

A very fair record from which to trace the progress of design when speed combined with reliability is in question is the "one hour." To capture this record, the tuning process has to be carried to just that limit where a sufficient degree of reliability will be retained. On this account, the hour records are generally admitted to be the most difficult to secure; there can be no question that the successful machines—and engines—are right in design, and have been skilfully tuned.

Sustained speed of sidecar machines for one hour.

Is there a Limit?

The upward soar of the graphs makes one wonder whether—if ever—finality in speed will be achieved. It may be that, in a few years' time, speeds which we now consider impossible will have been attained; on the other hand, it may be that progress in engine design will be checked by insuperable difficulty in holding the machine, so that attention will more than ever be directed towards more diminutive engine capacities.

Interest, therefore, attaches to the views held by the men who have been prominent in the high speed direction. Three of the best-known riders, on being asked to give an estimate of the maximum speeds which the various classes will have attained by this time next year gave the following figures, in considering which it should be borne in mind that the estimates are contingent upon an equal amount of development being recorded by each class, and upon favourable weather conditions obtaining when the machines are at their highest tune:

Solo.	Le Vack.	O'Donovan.	Pullin.
250 c.c. ...	90 ...	86-90 ...	91 m.p.h.
350 c.c. ...	103 ...	96-100 ...	102 m.p.h.
500 c.c. ...	105 ...	102-106 ...	108 m.p.h.
750 c.c. ...	110 ...	106-110 ...	112 m.p.h.
1,000 c.c. ..	115 ...	114-118 ...	117 m.p.h.

In O'Donovan's opinion, the 250 c.c., 350 c.c., and 500 c.c. machines have arrived at a stage of equal efficiency; he regards the 750 c.c. and 1,000 c.c. machines, however, as being not yet fully developed. The margin which he allows between his estimates of each class speed is on account of his views regarding the unsuitability of Brooklands for the highest speeds. The higher of the speeds which he indicates he intends to apply to a perfect, straight, speedway; the lower to the same machine on Brooklands.

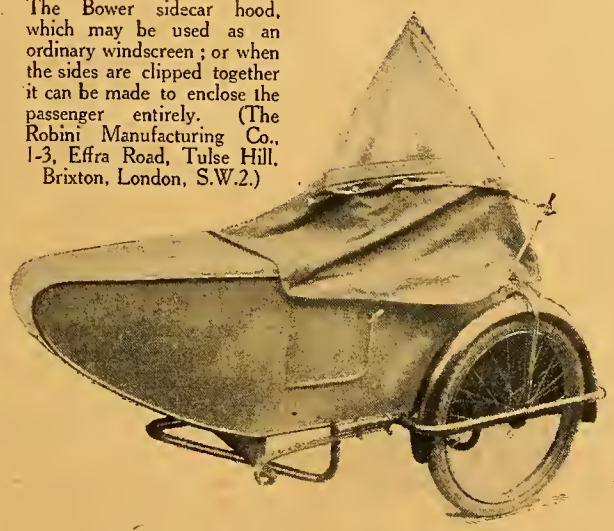
A World's Record. *B* British record. * Average mean speed. f.s. Flying start. s.s. Standing start.

Flying start kilometre records have also been set up in two new classes (Y, 175 c.c. scooters; and Z, 125 c.c. motor-assisted bicycles) by Janin (Monet Guyon) and Barthelemy (Rovin) respectively at 48·57 m.p.h. and 51·20 m.p.h.

Feeling Cold on Winter Runs. Advertised Price of Complete Outfits. Size of Bodies.

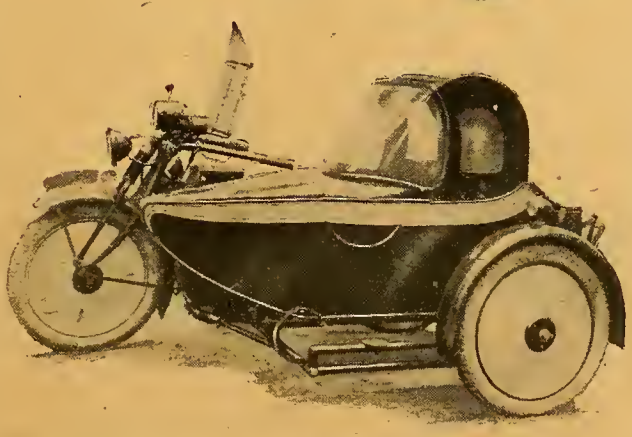
I LIKED the pose of a few of the stand attendants at the Olympia Show, who were, fortunately, in the minority. But the type is familiar at all trade exhibitions. I don't know the psychological effect of a canary waistcoat, immaculately creased trousers, and varnished hair on the average individual; but when a group of three or four attendants thus arrayed pose about the stand and lay down the law to each other with pompous gestures, the diffident little man who leaves his business for the day to come up with the "Missus," hesitates before disturbing these egregious males. He thinks they are directors at least, and goes on to the next stand.

What he should do, of course, is to go up to the "knuttiest," and say, loudly and imperiously, "You a director? Then just tell me this . . ." The polished attendant would have been up like a shot, and his colleagues would have melted mysteriously away.



The Bower sidecar hood, which may be used as an ordinary windscreen; or when the sides are clipped together it can be made to enclose the passenger entirely. (The Robini Manufacturing Co., 1-3, Effra Road, Tulse Hill, Brixton, London, S.W.2.)

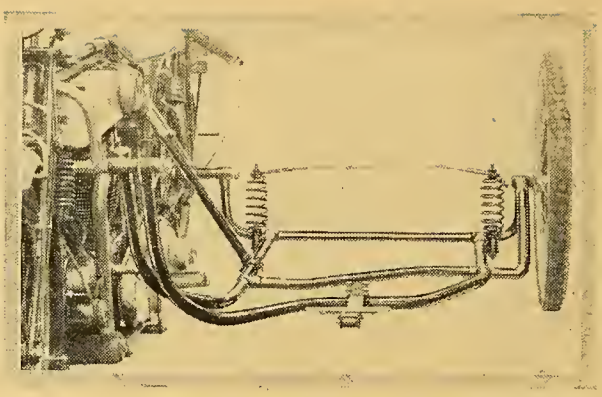
ONE of my colleagues, a hardy individual, hails from Cromarty. My most vivid memory of Cromarty is of a young, tousle-headed, kilted Scottie dancing a hornpipe with bare feet on a cold granite slab in a north-east wind that came in a hurry from Scandinavia. That was whilst sidecarring in the Highlands, and indicates the type of men they breed there. My colleague, who little thinks I am using him as a peg, rides in a thin coat in midwinter, and practically naked in the summer. We started an argument the other day as usual—that is the one thing that makes his life worth living. He started talking when he saw me envelop myself in layer after layer of clothing preparatory to a long journey north with my 595 c.c. Douglas outfit, which has seen its best days (we are not always riding new models). He contended that imagination has a good deal to do with "cold, shivery feelings," and that one becomes obsessed with the idea of feeling cold simply because a long journey confronts one on a motor cycle. I don't believe that. It certainly does seem strange why some individuals feel the cold more than others, and it is not always the fat folk that are able to smile in the face of a freezing wind. I am nearly always cold whilst motoring in frosty weather, although leg-guards have mitigated the evil of cold feet somewhat, and handle-bar muffs help to keep the fluid circulating in my fingers. I wish someone would reveal the secret of keeping warm on a 100-mile run when the thermometer is shy of rising. Imagination and the subconscious mind do play pranks, but they are not guilty in this particular case.



The Coupette sidecar, with rigid disappearing hood—a very graceful design and particularly suitable for medium-powered machines.

ASKED the other day where lay the most room for improvement in sidecars, I answered, "Body space." This opinion I strongly uphold. There is no part of an outfit that I could criticise so strongly. I may grumble at the inefficient mudguarding and leg-guarding, the paltry equipment offered outside the "extras" list, draughty hoods, or inefficient screens. But these things don't rouse my ire so thoroughly as when presented with an outfit to test, the body of which is low at the back, low at the side, and so narrow that the passenger has to sit stiffly in one position. Roomy bodies were decidedly scarce at the Show; roomy bodies are getting scarcer. I wonder why the A.J.S. concern altered its

Passenger Machine Topics.— 1919 design? The present one is undoubtedly amongst the most comfortable to-day, but the large model of 1919 was roomier still. Although I criticise that change, I appreciate the retention of the high back and the refusal to pander to the ridiculous tendency of offering semi-sporting patterns as touring models. I have heard any amount of criticism of the latter, and very just criticism, too.



The strong, simple and lightly constructed Copwill sidecar chassis, showing the method of attachment to the motor bicycle. The wheel has a detachable spindle.

WHILST grousing, I may as well do it thoroughly. So I will go off at a tangent on the question of "extras." Tell me a firm which boldly advertises the price of an outfit equipped with hood, screen, and side screens, lighting, speedometer, spare wheel, and grid. I cannot find one. A buyer has to reckon up the extras for himself, which is, from a psychological point of view, a bad thing to force a buyer to do. There seems no end to the "extras," just as there is no end to the "extras" when buying a new house. Not only should the big outfits be quoted complete, but so should the lower-priced one, too, for surely we have got beyond the stage of being influenced by a low advertised price which may be perfectly legitimate but somewhat misleading. The thoughtful man, of course, thinks of all the extras he needs before giving a definite order, and makes plans accordingly. But we are not all thoughtful, and it is annoying to find the bill piling up as we add accessory after accessory.

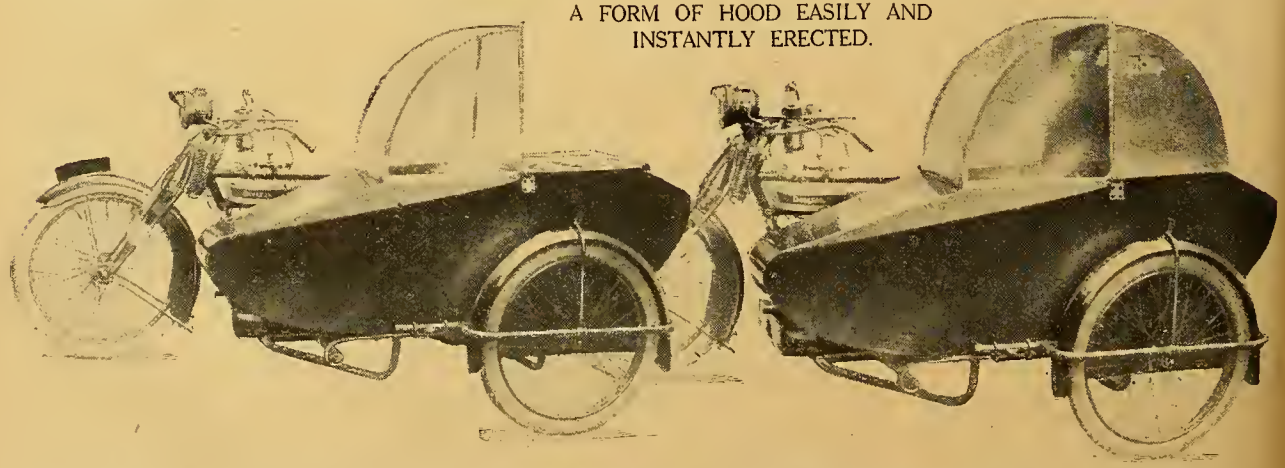
THE Motor Cycle has never hesitated to give publicity to any practical and well-conceived idea, even though from a comparatively small firm.

The Coupette hood and screen is a case in point. I have mentioned it before, and I contend again that Mr. Goad is on the right track in producing a hood and screen that is light and graceful (a most exceptional thing). Not only is there this advantage, but the hood is instantly swung back, leaving an effective screen in position. Note the last half dozen words. Now this type of hood and screen appear to me to be admirable for medium-weight machines, and may in the future become quite a standard type when manufacturers have abandoned the ancient flat screens which necessitate extra side curtains or celluloid panels. Of a similar type is the hood and screen conceived by Mr. H. W. Prockter, who has also aimed at lightness and quick adjustability.

THE pros and cons of carrying petrol whilst touring are often discussed. Though I rarely carry a spare tin myself, I thoroughly agree with those who argue that a spare tin does away with that subconscious worry of running out of fuel through some mischance and getting stranded in an outlandish spot. I saw the other day a specially made petrol can fixed in a bracket beneath the step of the sidecar. Another alternative would be to extend the sidecar step and carry the can (one-gallon) as on a car running-board

NOWADAYS there are not many variations in sidecar construction, but the Copwill chassis certainly shows some originality. Both inner and outer longitudinal members are curved upwards and are brought up to a post forming part of a special headclip, which is supported both on the top tube of the motor bicycle frame and the diagonal tube as well. The makers are the Light Car & Motor Cycle Engineering Co., 22, Tulse Hill, London, S.W.2.

A FORM OF HOOD EASILY AND INSTANTLY ERECTED.



A swinging hood and a curved screen which obviate the necessity of side curtains. The former, made of aluminium, swings back into the locker, leaving the sidecar clean and tidy in appearance. Mr. H. W. Prockter, 109a, Streatham Hill, London, S.W.2, is the maker.

WHO'S WHO in the MOTOR CYCLE WORLD.

The Second of a Series of Brief Biographies.

Ernest Ashford Bridgman, Assistant Manager, London.—E. A. Bridgman, who was born 53 years ago in Islington, was at one time well-known on the vaudeville stage as Frasetti. It was whilst associated with the "Halls" that Bridgman first took up motor cycles, and he used a trailer machine and later a sidecar on his tours. Successes in reliability trials led to his engagement in the motor cycle industry. As a motor cyclist he has had many successes in competitions, including the 200-mile sidecar race, the Mellano Cup Trial, the Kop Open Hill Climb, and a Southampton to Aberdeen trial. Present mount: Indian. Favourite type of machine: Indian light sporting sidecar outfit. Hobby: Motor cycling.

Frederick Lindsay Lloyd, Col. R.O., C.M.G., C.B.E.—From the earliest days of motoring, Colonel Lloyd has taken an active part in the development of mechanical transport. When serving in the R.E. he was a member of the Motor Transport Committee at the War Office. Within a very short time of the completion of Brooklands track, Colonel Lloyd became Clerk of the Course of the B.A.R.C. He is a Vice-President of the A.C.U., and has often acted in the capacity of judge at its competitions. Colonel Lloyd served with distinction both in the South African war and also in the great European war, receiving the C.M.G. and C.B.E. for services rendered. During the war he was in command of various R.A.S.C. M.T. depôts.

Archibald Montgomery Low, D.Sc., A.C.G.I., M.I.A.E., F.C.S., F.R.G.S., etc., Consulting Engineer and Professor of Physics, London.—Professor Low (born at Purley 36 years ago) is a prominent official of the A.C.U. He is attached to the Royal Artillery College and is author of various technical works. During the war he commanded as Major, R.A.F., the R.F.C. experimental works, and for his services was twice mentioned by the Secretary of State. His inventions are too numerous to mention, but the two best known to motor cyclists are his Audiometer for photographing sound and the Low generator. Professor Low has held many high offices in the A.C.U., and is a well-known judge in competitions. He is vice-chairman of the Junior Car Club and the A.C.U., vice-president of the A.C.U., and president of many provincial and London district clubs. Present mounts: Dunelt sidecar and Economic, Douglas, and Low solo machines. Favourite type of machines: Multi-cylinder two-stroke, with positive transmission, four-cylinder F.N., and Scott. Hobbies: The study of high speed motion by cinematography and the investigation of problems of atomic motion.

Cyril Williams, Motor Agent, Wolverhampton.—Cyril Williams was born at Wolverhampton, and is 34 years of age. He was one of the first motor cyclists in Wolverhampton in days when "there was more tinkering than riding," and has been actively connected with motor cycles ever since, both as rider and dealer. His principal successes in competitions were in 1914 and 1920. In 1914 he came second in the Junior T.T. and first in the Brooklands race for Junior T.T. machines. In 1920 he won the Junior T.T. Between those years he was serving his country in the Army with distinction, as witness his decorations: the Military Medal, the Mons Star, and "Mentioned in Despatches." Present mounts: G.N.-Vitesse and 349 c.c. A.J.S. Favourite type of machine: "Anything fast." Hobby: Motoring.

Archibald George Cocks, Commercial Representative, Aberdovey.—"Archie" Cocks was born at Burton Overy, Leicestershire, and his experience with cycles and cars goes back to the earliest days of motoring. In 1899 he drove a 12 h.p. Daimler car with four-cylinder engine and tube ignition, later taking up motor cycling with a Clement-Gerrard engine fitted in the frame of a pedal cycle. In pre-war days he was a successful trials exponent of the Connaught two-stroke (both solo and with sidecar), and his climb of the Great Orme on a single-geared Levis was an outstanding one. In 1919 he competed in the Irish End-to-End trial, on a 269 c.c. Clyno, and was among the few who finished the run. Present mount: 598 c.c. Beardmore-Precision sidecar. Favourite type of machine: Single-cylinder sidecar or single-cylinder two-stroke. Hobbies: Wireless telegraphy, sailing, motor-boating, and freak hill-climbing on a solo motor cycle.

Mrs. Gwenda Mary Janson, Racing Motor Cyclist and Competition Rider, London.—Mrs. Janson, who was born in Ireland, is one of the most successful of women competition riders, and has several records to her credit. These successes include a double 12 hours world's record at Brooklands and a standing mile British record, both were made on a 249 c.c. Trump-Jap machine. Mrs. Janson rode the Ner-a-car for 1,000 miles under A.C.U. observation in November, 1921, and won one of the Ealing Club's three-lap handicaps at Brooklands this year. Mrs. Janson has also a very remarkable war record. While attached to the Russian Army she drove a field ambulance on the Rumanian and Russian fronts, rewards for conspicuous service being the medal of St. George (2nd class), medal of St. Stamstans (2nd class), Order of St. Anne (3rd class), and mentioned in Russian Army despatches. She holds, of course, the British War and Victory medals. Present mount: Trump. Favouite type of machine: 500 c.c. sporting single.

MOTOR CYCLES FOR ALL PURSES.

A Price-Classified List of 680 Models produced by Manufacturers who Exhibited at the Olympia Show.

MOTOR BICYCLES.

The lists of prices given in this and the following pages are compiled from the catalogues of manufacturers who exhibited at the recent motor cycle exhibition. They illustrate the wide range of models now available to the public, and include solo models from £21 3s. to £160 and passenger machines from £63 to £200. Specifications are briefly outlined where they depart from the standard equipment of three-speed gear, clutch, and kick-starter.

£105, Monopole, 680 c.c.
£105, P. and M., 555 c.c., 4 spd., K.S. and C.
£105, Douglas, 733 c.c.
£105, Weatherell, 696 c.c.
£105, American X, 999.5 c.c.
£107, Indian, 997 c.c. (standard model).
£107, B.S.A., 986 c.c.
£107 15s., Harley-Davidson, 988 c.c.
£109, Zenith, 976 c.c., variable gear.
£110, Scott, 532 c.c., T.S.
£110, Scott, 486 c.c., T.S., 2 spd., K.S. and C.
£110, Coventry Victor, 688 c.c. (super-sports model).
£110, F.N., 748 c.c.
£110, Matchless, 976 c.c. (sports model).
£110 5s., Sunbeam, 492 c.c. (T.T. sports model).
£110 5s., Sunbeam, 499 c.c. (sports model).

£111 to £120.

£111 6s., O.E.C.-Blackburne, 696 c.c.
£112 10s., Harley-Davidson, 988 c.c. (electric model).
£113, Indian, 596 c.c. (electric model).
£113 8s., O.E.C.-Blackburne, 998 c.c.
£115, Zenith, 976 c.c.
£115, Matchless, 976 c.c. (super-sports model).
£115, Brough Superior, 740 c.c.
£115, Weatherell, 696 c.c. (o.h.v. model).
£117, New Imperial, 976 c.c.
£120, Harley-Davidson, 1,203 c.c.
£120 15s., Sunbeam, 599 c.c.

£121 to £130.

£123, Indian, 997 c.c. (electric model).
£124 15s., Harley-Davidson, 1,208 c.c. (electric model).
£125, Brough Superior, 740 c.c. (sports model).
£125, Zenith, 976 c.c. (super-"eight" model).
£125, Martinsyde, 673 c.c.

£131 to £140.

£131, Zenith, 976 c.c., 4 spd., K.S. and C.
£132, Indian, 997 c.c.
£135, Bianchi, 600 c.c.
£137, Henderson, 1,301 c.c.
£137, Indian, 1,204 c.c.
£140, Dot, 976 c.c. (sports model).

Over £140.

£141 15s., Sunbeam, 976 c.c.
£145, P.V., 976 c.c.
£150, Brough Superior, 976 c.c.
£160, Brough Superior, 976 c.c. (with 80 m.p.h. certificate).

MOTOR CYCLES FOR ALL PURSES (*continued*).

PASSENGER MOTOR CYCLES AND RUNABOUTS.

Under £70.

£33 12s., Airolite, 110 c.c., T.S., with child's sidecar.
£32 12s., Airolite, 110 c.c., with trade carrier.
£60 18s., Radco, 247 c.c., T.S., with trade carrier.
£63, Radco, 247 c.c., with T.S., "No. 2" sidecar.
£67, Sirrah, 292 c.c., T.S., with sidecar.
£69 10s., Powell, 343 c.c., T.S., with sidecar.

£70 to £80.

£70, Victoria, 343 c.c., with sidecar.
£70 7s., Radco, 247 c.c., T.S., with sidecar.
£72, Sirrah, 293 c.c., with sidecar.
£72 10s., Grigg, 343 c.c., T.S., with sidecar.
£72 10s., Orbit, 261 c.c., T.S., with sidecar.
£73 15s., Radco, 247 c.c., T.S., with sidecar (sports model).
£74, Sirrah, 349 c.c., with sidecar.
£74 10s., O.K., 292 c.c., T.S., with sidecar.
£75, Beardmore-Precision, 348 c.c., with sidecar.
£75, Sparkbrook, 346 c.c. with sidecar.
£75, Calthorpe, 349 c.c., 3 spd., K.S. and C., with sidecar.
£75, Omega, 348 c.c., T.S., with sidecar.
£77 10s., Wooler, 345 c.c., 3 spd., C., with sidecar.
£78 15s., Connaught (De Luxe model), 348 c.c., with sidecar.
£80, Victoria, 346 c.c., with sidecar.
£80, 499 c.c. Rudge-Multi.
£80, Quadrant, 490 c.c., with sidecar.
£80, Grigg, 343 c.c., with sidecar.
£80 17s., Allon, 346 c.c., with sidecar.

Over £80, Under £90.

£83, Raleigh, 378 c.c., with sidecar.
£83, Raleigh, 378 c.c., with trade carrier.
£84, Allon, 346 c.c., with sidecar.
£85, Argson, 170 c.c., single spd. (invalid carriage).
£85, Orbit, 349 c.c. (B. and S. model), with sidecar.
£85, Orbit, 349 c.c. (Bradshaw model), with sidecar.
£85, Velocette, 249 c.c., T.S., with sidecar.
£85, Sun, 348 c.c., with sidecar.
£85, Francis Barnett, 346 c.c., with sidecar.
£85, New Imperial, 346 c.c., with sidecar.
£87, Coventry-Mascot, 348 c.c., 2 spd. K.S. and C., with sidecar.
£87, Ivy, 349 c.c., T.S., with sidecar.
£87 10s., Orbit, 348 c.c. (o.h.v. model), with sidecar.
£88, Sheffield-Henderson, 350 c.c., with sidecar.
£88, Sheffield-Henderson, 348 c.c., with sidecar.
£89, Coventry-Mascot, 249 c.c., with sidecar.
£89 10s., Dunelt, 499 c.c., T.S., with sidecar.

£90 to £100.

£90, Victoria, 549 c.c., with sidecar.
£90, Victoria, 549 c.c., with trade carrier.
£90, Sheffield-Henderson, 350 c.c., with sports sidecar.
£90, Quadrant, 654 c.c., with sidecar.
£90, Sheffield-Henderson, 348 c.c., with sports sidecar.
£90, Beardmore-Precision, 496 c.c., with sidecar.
£90, Sheffield-Henderson, 348 c.c. (sports model), with sports sidecar.
£90, Beardmore-Barr and Stroud, 349 c.c., with sidecar.
£90, Alecto, 345 c.c., T.S., with sidecar.
£92 10s., Massey, 346 c.c., with sidecar.
£92 10s., Orbit, 499 c.c. (B. and S. model), with sidecar.
£94 10s., Xtra Car, 247 c.c., T.S., 2 spd., hand-starter and C.
£95, Dunelt, 499 c.c., T.S. (all-chain drive), with sidecar.
£95, Quadrant, 654 c.c. (all-chain drive), with sidecar.
£95 10s., Wooler, 345 c.c. with sidecar.
£96, Verus, 348 c.c., with sidecar.
£96 10s., Henley, 345 c.c., with sidecar.
£97, B.S.A., 557 c.c., with sidecar.
£97 13s., O.E.C.-Blackburne, 346 c.c., with sidecar.
£97 15s., Edmund, 348 c.c. (sports model), with sidecar.
£97 15s., Edmund, 348 c.c., with sidecar.
£99, A.J.S., 349 c.c., with sidecar.
£99 15s., Lea-Francis, 496 c.c., with sidecar.
£99 15s., Xtra Car, 343 c.c., T.S., 2 2 spd., hand-starter and C.
£100, Harper Runabout, 269 c.c. (single-seated three-wheeler).
£100, Rudge, 499 c.c., 4 spd., K.S., and C., with sidecar.
£100, Chater-Lea, 545 c.c., with sidecar.
£100, Beardmore-Precision, 598 c.c. (rigid frame), with sidecar.

Over £100, Under £110.

£101 10s., Norton, 490 c.c., with sporting sidecar.
£102, Ariel, 498 c.c., with sidecar (all-chain drive, sports model).
£102 10s., Powell, 547 c.c., with sidecar.
£102 10s., Powell, 547 c.c., with trade carrier.
£103, Sheffield-Heoderson, 348 c.c. (o.h.v. model), with sports sidecar).
£105, Xtra Car, 343 c.c., T.S., 2 spd., hand-starter and C.
£105, Hawker, 545 c.c., with sidecar.
£105, Beardmore-Precision, 598 c.c., with sidecar.
£105, Humber, 600 c.c. (sports model), with sidecar.
£105, Dunelt, 499 c.c., T.S., with De Luxe sidecar.
£105 17s. 6d., Triumph, 550 c.c., with trade carrier, electric equipment.
£106 17s. 6d., Triumph, 550 c.c., with sports sidecar, electric equipment.
£107, Ariel, 498 c.c., with sidecar.
£108, Dunelt, 499 c.c., T.S. (all-chain drive), with De Luxe sidecar.

£110 to £120.

£110, Douglas, 595 c.c., with sidecar.
£110, Quadrant, 654 c.c., with sidecar (De Luxe model, all-chain drive).
£110, Hazlewood, 654 c.c., with trade carrier.
£110, Hazlewood, 654 c.c., with sidecar.
£112, New Hudson, 595 c.c. (sports model), with sports sidecar.
£112, New Hudson, 595 c.c., with sidecar.
£112, Hazlewood, 654 c.c. (sports model), with sidecar.
£112, Norton, 633 c.c., with Family sidecar.
£112 2s. 6d., Triumph, 550 c.c., with sidecar, electric equipment.
£113 8s., O.E.C.-Blackburne, 550 c.c., with sidecar.
£113 10s., Norton, 633 c.c., with Doorway sidecar.
£114 17s. 6d., Triumph, 550 c.c. (all-chain drive), with trade carrier, electric equipment.
£114 18s. 6d., Rex Acme, 550 c.c., with sidecar.
£115, Hazlewood, 976 c.c., with sidecar.
£115, Chater-Lea, 976 c.c., with sidecar.
£115, Douglas, 595 c.c. (all-chain drive), with sidecar.
£115 17s. 6d., Triumph, 550 c.c. (all-chain drive), with sports sidecar, electric equipment.
£117, Coventry Victor, 688 c.c., with sidecar.
£118, Hazlewood, 654 c.c., with sidecar.
£118, Excelsior, 680 c.c., with sidecar.
£118 10s., Indian, 596 c.c., with sidecar.
£118 17s. 6d., Triumph, 499 c.c., with sports sidecar, electric equipment.
£119 10s., Ariel, 776 c.c., with sidecar.
£119 18s. 6d., Rex Acme, 499 c.c. (B. and S. model), with sidecar.
£120, Campion, 976 c.c., with sidecar.
£120, Scott, 532 c.c., T.S., 2 spd., K.S. and C., with sidecar.
£120, Coventry Victor, 688 c.c., with sidecar (special model).
£120, Royal Enfield, 976 c.c., with sidecar.
£120, Royal Enfield, 976 c.c., trade carrier.
£120, Humber, 600 c.c. (touring model), with sidecar.
£120 10s., Lea-Francis, 592 c.c., with sidecar.

£121 to £130.

£121 2s. 6d., Triumph, 550 c.c. (all-chain drive), with sidecar, electric equipment.
£122, P.V., 680 c.c., with sidecar.
£122 17s., Xtra Car, 976 c.c., 2 spd., hand-starter and C.
£123, Excelsior 976 c.c., with sidecar.
£123, Hazlewood, 654 c.c., with sidecar (all-chain drive).
£124, Lea-Francis, 592 c.c., with coupette sidecar.
£125, Royal Enfield, 976 c.c., with 2-seater sidecar.
£125, Clyno, 925 c.c., with sidecar.
£125, James, 749 c.c., with sidecar.
£125, P. and M., 555 c.c., 4 spd., K.S. and C., with sidecar.
£125, Rudge, 998 c.c., 4 spd., K.S. and C., with sidecar.
£125, Raleigh, 700 c.c., with sidecar.
£125, New Imperial, 976 c.c., with sidecar.
£125, New Hudson, 595 c.c., with De Luxe sidecar.
£125, New Hudson, 595 c.c., with Family sidecar.
£125 12s. 6d., Triumph, 499 c.c., with super-sports sidecar, electric equipment.
£127, New Imperial, 976 c.c., with trade carrier.
£127 10s., Coventry Victor, 688 c.c., with two-seater sidecar.
£128, Morgan, 976 c.c. or 998 c.c., 2 spd., handle-starter and C.
£130, Matchless, 976 c.c. or 993 c.c., with sidecar.
£130, Raleigh, 700 c.c., with De Luxe sidecar.
£130, New Imperial, 976 c.c., with tandem sidecar.
£130, Dot, 976 c.c., with sidecar.
£130, Brough Superior, 976 c.c.
£130, Martinsyde, 678 c.c., with sidecar.
£130, Matchless, 976 c.c., with sports sidecar.
£130, Martinsyde, 678 c.c., with sports sidecar.
£130, Martinsyde, 678 c.c., with trade carrier.
£130 5s., American X, 999.5 c.c., with sidecar.

£131 to £140.

£133, Indian, 997 c.c. (standard model), with sidecar.
£134, New Imperial, 976 c.c., with coupé sidecar.
£134 10s., Ariel, 994 c.c., with sidecar.
£135, F.N., 748 c.c., with sports sidecar.
£135, F.N., 748 c.c., with sidecar.
£135, Royal Enfield 976 c.c., with sidecar, electrically equipped.
£135, Scott, 532 c.c., T.S., with sidecar.
£135, Indian, 596 c.c., with sidecar (electric model).
£135, Harley-Davidson, 998 c.c., with sidecar.
£136, P. and M., 555 c.c., 4 spd., K.S. and C., with sidecar.
£138 12s., O.E.C.-Blackburne, 700 c.c., with sidecar.
£139 15s., Harley-Davidson, 998 c.c., with sidecar (electric model).
£140, B.S.A., 986 c.c., with sidecar.
£140, F.N., 748 c.c., with De Luxe sidecar.
£140, Douglas, 733 c.c., with sidecar.
£140, Matchless, 976 c.c. or 993 c.c. (model "H"), with sidecar.
£140, F.N., 748 c.c., with "Family" sidecar.
£140, Matchless, 976 c.c. or 993 c.c. with sidecar (sports model).
£140, Royal Enfield, 976 c.c., special trade carrier.
£140, Harley-Davidson, 988 c.c., with two-seater sidecar.
£140 14s., O.E.C.-Blackburne, 998 c.c., with sidecar.

£141 to £150.

£141 15s Sunbeam, 499 c.c., with sidecar.
£145, Harley-Davidson, 988 c.c., with two-seater sidecar (electric model).
£145, Matchless, 976 c.c. or 993 c.c., with sidecar (super sports model).
£145, Matchless, 976 c.c. or 993 c.c., with two-seater sidecar.
£145, Coventry-Victor, 688 c.c., with sidecar (De Luxe model).
£145 19s., L.S.D., 976 c.c. (three-wheeler).
£147 5s., Harley-Davidson, 1,208 c.c., with sidecar.
£149, Indian, 997 c.c. (electric model), with sidecar.
£150, Bianchi, 600 c.c. with sidecar.
£150, Campion, 980 c.c., with sidecar (De Luxe model).

£151 to £160.

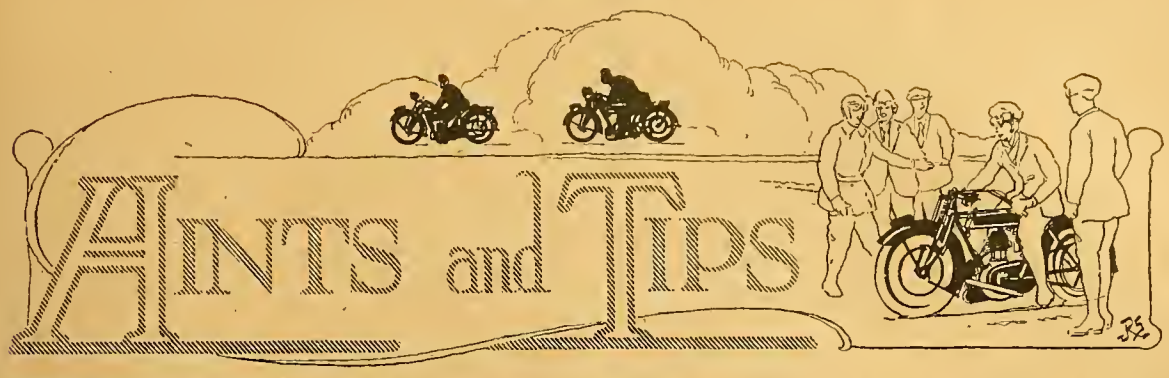
£152, Harley-Davidson, 1,208 c.c., with sidecar (electric model).
£152 10s., A.J.S., 799 c.c., with sidecar.
£152 10s., Harley-Davidson, 1,208 c.c., with two-seater sidecar.
£155, T.B., 976 c.c., 3 spd., reverse, handle-starter and C.
£157, Campion, 976 c.c., with sidecar (sports model).
£157 5s., Harley-Davidson, 1,208 c.c., with two-seater sidecar (electric model).
£157 10s., Sunbeam, 599 c.c., with sidecar.
£157 10s., A.J.S., 799 c.c., with two-seater sidecar.
£158, Indian, 997 c.c., with sidecar.
£158, Morgan, 976 c.c. or 998 c.c., 2 spd., handle-starter and C. ("Family" model).
£160, Morgan, 976 c.c., 2 spd., handle-starter and C. (Grand Prix model).

£161 to £170.

£163, Indian, 1,204 c.c., with sidecar.
£163 5s., Henderson, 1,301 c.c., with sidecar.
£165 10s., T.B., 976 c.c., 3 spd., reverse, handle-starter and C. (De Luxe model).
£167, P.V., 976 c.c., with sidecar.
£167, Indian, 1,204 c.c., with two-seater sidecar.
£170, Dot, 976 c.c., with sidecar (sports model).

Over £170.

£175, T.B., 976 c.c., 3 spd., reverse, handle-starter and C. (sports model).
£176 8s., Scott Sociable, 578 c.c. (three-wheeler).
£184, Brough Superior, 998 c.c., with sidecar.
£186 18s., Sunbeam, 976 c.c., with sidecar.
£200, Morgan, 976 c.c., 2 spd., handle-starter and C. ("Aero" model).



The Third of a New Series of Notes for the Beginner Explaining in Non-technical Language Points which may have Mystified Him.

TIMING THE ENGINE.

PROBABLY the timing gear of an engine is the most mysterious department to the man who but rarely dabbles in technical matters. There is, however, one golden rule for re-assembling valve timing gear which is guaranteed to put anyone who understands it on the right road to timing any engine in half a minute. Assuming the cam wheels are not punch marked, and the timing is unknown, proceed as follows: place the piston on top dead centre (on a twin-cylinder engine the back cylinder is No. 1—time from that) and bear in mind that the engine is now at the end of the exhaust stroke and at the beginning of the induction stroke. Insert the exhaust cam wheel in such a position, therefore, that the slightest revolution of the engine will cause the cam just to pass from under the rocker which lifts the valve. Place the inlet cam wheel in mesh with the small pinion on the engine shaft so that the cam is just about to lift the valve. Every engine yet made is correctly timed if the exhaust valve shuts immediately past the top dead centre whilst the inlet valve is just lifting as the exhaust closes. One tooth either way will make a great deal of difference, and the incorrectness of the timing will be immediately apparent. If the timing of a strange engine is approached from the other direction —*i.e.*, the opening of the exhaust valve—the process is not nearly so simple.

NOISY TIMING GEAR.

THE timing gear of an engine can give rise to noises which an unpractised ear may blame on to other inoffensive parts, such as big end bearing and piston. If the teeth of the cam wheels are not a perfect fit, they will set up either a "sing," or else a rattle, depending on whether they are too deep in mesh or too loose fitting. A rattling timing gear will lead many people to wager that the big end bearing has developed slackness. A good way to trace noise due to timing gear is to leave the engine running slowly on the stand, and, with a long wood-handled screwdriver, to place the business end on the outside of the timing case near to one of the cam wheels and to press the ear against the wood handle. This simple stethoscope can be turned to good account in locating quite a number of elusive engine noises, the sounds being intensified in an extraordinary manner.

MAKERS' TIMING BEST.

ONE of the first parts of the engine to which the would-be tuner-up turns when he feels that he is a budding Pullin is the valve timing gear, under the impression that, by making the exhaust or inlet valve open earlier or later, more speed will be obtained. Don't fall into this trap. No advantage whatever can accrue from such procedure, provided the timing gear has been assembled correctly in the first place. If incorrect valve timing is suspected, remove the compression tap and place the piston at top dead centre of the exhaust stroke. If the exhaust valve is on the point of closing, and the inlet valve is just lifting from its seating, the timing is perfectly correct, and any alteration of the cam wheels by one tooth will make matters worse instead of better.

MAGNETO TIMING.

SOMETIMES it is possible to make an improvement in running by adjusting the setting of the magneto. If it is not sufficiently advanced, the engine runs sluggishly and uses more fuel than it should. It will also run hotter. The spark must occur before the piston reaches the top of the compression stroke, in order that the explosion may have raised the pressure of the gas inside the cylinder to its maximum by the time the piston is on the point of descending on the working stroke. If the spark occurs too late, the gas is not properly ignited, and consequently some portion of its expansion power is lost. It is easy to tell if the spark is timed late; with the machine running on the road, retard the ignition slightly. If the power immediately falls off and the engine becomes "dead" and sluggish, will not accelerate, and has no speed, then the spark is late. Correctly timed, it should be possible to retard the spark a trifle without any appreciable effect upon running being felt. To make a rough test on the stand, set the throttle to allow the engine to run fairly slowly and then retard the spark fully. If the engine peters out altogether, it may be taken that the ignition is late. The engine should continue to run on full retard, but in a ponderous, deliberate sort of fashion. A good all-round method of timing the magneto is to place the piston on top dead centre of the compression stroke and, retarding the ignition lever *almost* fully, set the contact-breaker points just separating.

MOTOR CYCLISTS' INTERNATIONAL CONGRESS.

Ten Countries Represented at the Winter Conference of the F.I.C.M.

A.C.U. not to Control Cycle Cars. Record Conditions to be Altered. Next Year's International Six Days Trials in Sweden.

DELEGATES from ten large motor cycling countries met in London last week. For the first time since 1919 the International Federation of Motor Cycle Clubs, known as the F.I.C.M., held congress in England.

A sub-committee sat for the purpose of confirming and checking claims for world's records, with the result that for the first time since motor cycle records have been placed on a proper footing Continental nations figure in the world's records list. Consequently in the list, published elsewhere in this issue, Italy has several records to her credit in Class B, and France has a record in the new Class Z for motor-assisted bicycles, another in the "scooter" class (Class Y, for machines not exceeding 175 c.c.), and two more in the cycle car classes.

Ten Nations Represented.

The delegates of the *Fédération Internationale des Clubs Motocyclistes* were entertained at an official luncheon by Great Britain, and ten nations were represented—the United States of America, Spain, Holland, Italy, Belgium, France, Denmark, Sweden, Switzerland, and Great Britain.

At the conference the chair was occupied by the Hon. Sir Arthur Stanley, G.B.E., C.B., M.V.O., who was ably supported by M. Jules Neher, President of the Swiss Motor Cycle Union, who rapidly translated every speech into French.

Arising out of the minutes of the last meeting at Geneva on August 11th was a point concerning tyre sizes for Class E (1,000 c.c.) machines on racing tracks. On the occasion of the last meeting it was decided that such machines need not have tyres exceeding 65 mm., as owing to the extreme angle at which these machines lean over at high speeds large tyres prove a source of danger. This matter was again brought up, and after a little discussion it was decided that the rule might also apply to sidecars. Mr. W. H. Wells (U.S.A.) pointed out that, naturally, with sidecars the question of danger did not arise, but it might prove awkward to change over tyres during a race meeting, and consequently it was agreed that the rule might apply to Class G sidecar outfits also.

A considerable amount of time was devoted to hearing reports on the state of motor cycle affairs in Spain, which are still in a somewhat chaotic condition. Assurance, however, was received from the Spanish delegate, Señor Gutierrez, who reported that the Royal Spanish Motor Cycle Club was using every effort to form a representative motor cycling body in his country, but difficulty was experienced in getting the Cataluña Club, which also aspires to govern the pastime, to see eye to eye with the R.S.M.C.C. He assured the meeting that his club had the support of all the Spanish clubs except the last-named, and that even the Hispano-American Federation had approached it with a view to representation. In consequence, the chairman stated that all that could be done would be to accept the assurance of the Spanish representatives that they would do all in their power to bring the Cataluña Club into the family.

Control of Four-wheel Cycle Cars.

An interesting discussion followed respecting the control of cycle cars. In all Continental countries cycle cars with engines up to 1,100 c.c. and not exceeding 350 kilogrammes in weight (770 lb.) were looked after by the motor cycling bodies, but at the present moment in

OFFICIALS AND DELEGATES AT THE F.I.C.M. CONGRESS IN LONDON.

(1) The Hon. Sir Arthur Stanley, G.B.E., C.B., M.V.O., President F.I.C.M. (2) Count Albert Bonacossa, Vice-President F.I.C.M. (Italy). (3) M. Jules Neher, Vice-President F.I.C.M. (Switzerland). (4) Sir Julian Orde, Secretary R.A.C., Vice-President A.C.U. (5) Col. F. S. Brereton, C.B.E., Chairman A.C.U. (6) T. W. Loughborough, General Secretary F.I.C.M., Secretary A.C.U. (7) L. B. Gutierrez (Spain). (8) E. Collignon (Belgium). (9) A. V. Ebblewhite (Great Britain). (10) M. Pire (Belgium). (11) A. W. Polack (France). (12) G. K. Anderson (Sweden). (13) F. Ribed (Spain). (14) Major Dixon Spain, D.F.C., Assistant Secretary A.C.U. (15) A. C. Reynolds (Great Britain). (16) H. P. E. Harding (Great Britain). (17) Capt. Axel Tryde (Denmark). (18) Baron C. Nothomb, President Belgian Motor Cyclists' Federation. (19) J. G. van Turenhout (Holland). (20) H. R. Watling, General Manager British Motor Cycle Manufacturers' Union. (21) W. H. Wells (U.S.A.). (22) M. Zegers Veeckens (Holland). (23) E. M. P. Boileau (Great Britain). (24) E. d'Eternod (Switzerland). (25) J. W. G. Brooker, Chairman Competitions Committee A.C.U. (26) Prof. A. M. Low, Management Committee A.C.U.

Motor Cyclists' International Congress.—England every pleasure vehicle with four wheels remains under the ægis of the Royal Automobile Club.

Mr. W. H. Wells (U.S.A.) strongly supported the existing arrangement, but the Continental representatives—M. A. W. Polack (France), Baron Nothomb (Belgium), and M. Jules Neher (Switzerland)—took the other view, and on the suggestion of Mr. E. M. P. Boileau (Great Britain) the chairman put the matter to the vote, and the meeting expressed itself in favour of adopting the general Continental policy.

The matter was then left to be decided finally by the Congress of Recognised Automobile Clubs, held last Thursday (where it was decided that the R.A.C. would continue to control the cycle car movement in this country).

International travelling arrangements also received the attention of the meeting, but after some discussion it was felt that it would be wiser to leave the existing formalities as they were. M. Neher stated that the whole matter was an extremely delicate one, but it was hoped that eventually one document would suffice for the purpose of driving licence, customs facilities, insurance, and so forth.

Records in More Than One Class.

A somewhat important decision was come to regarding the rules under which records were run, the question involved being whether a machine of a smaller class, owing to its superior speed, might hold records in the class above it. The matter was very fully thrashed out, and it was eventually decided that such a procedure would not be allowed unless the smaller machine conformed to the limits applicable to the superior class—*e.g.*, as regards weight and size of tyres.

Interesting news was forthcoming concerning the 1923 International Six Days Trials. Mr. G. K. H. Anderson (Sweden) stated that since 1913 his club had organised trials every year, of which the most important were the May Trials over a course of more than 1,700 kilometres (approximately 1,056 miles), and for which last year eighty entries were received. Next year's International Trials would be organised in conjunction with the Norwegian club, and two days would be spent in Norway. The rules would be mainly on the lines of those followed in the 1922 event which was held in Switzerland, but no marks would be lost for condition. He also pointed out that whereas the speed limit in Sweden was 36 km.p.h. (22.3 m.p.h.), in Norway it was 30 km.p.h. (about 18.6 m.p.h.). The trial will include several hill climbs and a flying kilometre speed trial.

The next business of the meeting was to draw up the International Fixture List for 1923, which stands as follows :—

June 10th.—Swiss Grand Prix.
June 11th, 13th, 15th.—T.T. Races (I.O.M.).
June 23rd-24th.—Fanoe Speed Trials (Denmark).
June 30th.—The Spanish Twelve Hours Race.
A date between July 1st-15th.—French Grand Prix.
15 days after French Grand Prix.—Belgian Grand Prix.
August 6th-12th.—International Six Days Trials (Sweden).
August 29-September 5th.—English Six Days Trials.
September 10th.—Italian Grand Prix.

Count Bonacossa (Italy) asked for details of rules affecting the running of records, and the inclusion of records from 7 to 11 hours, which had been previously omitted. This request was also put forward by Great Britain, as it was felt to be illogical to leave a gap between the 6 and 12 hours records.

Mr. W. H. Wells (U.S.A.) asked that no record made by one man should be superseded by one made by team riders, which was referred to the Special Records Sub-Committee.

Details of rules affecting records were left to a special Sub-Committee consisting of Count Bonacossa (Italy), Messrs. T. W. Loughborough, A. V. Ebblewhite (Great Britain), and Mr. W. H. Wells (U.S.A.).

Count Bonacossa also called for a definition between motor-assisted bicycles and lightweight motor bicycles, and this was finally left to the Records Committee to deal with.

Additional Trophy.

Mr. Zegers Veeckens (Holland) proposed that a cup should be offered in the International Six Days Trials for competition among international teams composed of riders of machines of foreign manufacture. It will be recalled that in this year's event in Switzerland the Norwegians desired to enter, but were precluded on account of the fact that there is no Norwegian-made motor cycle.

A complaint of the Royal Dutch M.C.C. regarding the failure of England to send a team to the Anglo-Dutch trial last summer was fully discussed. Matters were gone into in great detail by Mr. J. W. G. Brooker, chairman of the A.C.U. Competitions Committee, who showed that there were faults on both sides; but Colonel F. S. Brereton, chairman of the A.C.U., admitted that the fault was largely his, and tendered the Dutch club a humble apology, and sincerely hoped that he would be able to visit Holland with an English team next year.

After the vote of thanks to the chairman, Count Bonacossa presented to the Hon. Sir Arthur Stanley a handsome badge of the Moto-Club d'Italia.

A BANQUET TO THE F.I.C.M. DELEGATES.

A BANQUET was given to the delegates of the F.I.C.M. at Jules' Restaurant, Jermyn Street, London, W., at which the chair was occupied by Lt.-Col. F. S. Brereton, C.B.E. After the loyal toasts, Prof. A. M. Low rose to propose "The Motor Cycle Movement." The motor cycle, he said, is the most efficient form of transport known. He remembered cases during the war where wireless had failed but motor bicycles managed to win through. He hoped it would not be long before people would be saying that a man had not really lived who had not ridden a motor bicycle. The movement provided the finest sport in the world and health for all.

Rivalling the Ford.

Mr. H. R. Watling, in reply, said that he thought that the international representatives who had come to London were brave men and jolly good fellows. The movement could not progress without users' organisation and the Press. He sincerely hoped that the movement would prosper in other countries as it had done in England, but he thought that we heard a little too much of the sport and pastime, and he would prefer to regard the motor cycle as a serious competitor to the railway. He thought the sidecar outfit the best competitor the Ford had. He was assured that it cost £5 a week to run a Ford. Did, he asked, any sidecar outfit, British, American, or Swiss, cost as much to run as that? (Cheers.)

CHRISTMAS HOLIDAYS.

Publishers' Announcement.

Readers who wish to insert Miscellaneous Advertisements in the issue of "The Motor Cycle" dated December 28th should note that, due to the Holidays intervening, instructions must be in our hands by first post on Wednesday, December 20th, addressed to Dorset House, Tudor Street, London, E.C.4.

ILIFFE & SONS LIMITED.

In rising to propose the toast of the visitors, Col. Brereton said he was sure that such meetings as had been held that afternoon did more for international friendship than the various serious political meetings of which we have heard so much recently. He sincerely hoped to see union in Spain, and on the next occasion that the Spanish representative would come with the good news that the Catalunian Club had joined the fold.

Other Toasts.

M. Jules Neher and Mr. Zegers Veeckens replied. It then fell to Mr. J. W. G. Brooker to propose the toast of the Press, which was replied to by Messrs. Geoffrey Smith and E. M. P. Boileau (*The Motor Cycle*).

Mr. W. H. Wells proposed the toast of the President, who was unfortunately absent from the dinner, mentioning the wonderful work he had done in the war in connection with the British Red Cross Society and the Order of St. John of Jerusalem, and his work as President of the A.C.U. and chairman of the R.A.C. Colonel Brereton replied.

The Editor does not hold himself responsible for the opinions of his correspondents.

Correspondence should be addressed to the Editor, "The Motor Cycle," Dorset House, Tudor Street, E.C.4, and must be accompanied by the writer's name and address.

PILLION RIDING IN SAFETY.

Sir,—May I say that I entirely agree with "A.B.C." in his opinion that when seated "side saddle" a passenger can alight quickly in an emergency, and I might add that one gets just as used to keeping one's balance like this as one does astride. "PILLION GIRL."
Westcliff-on-Sea.

Sir,—I have been following closely your correspondence columns in reference to pillion riding. The letter of Mr. H. Killingbeck is surely an inspiration.

Most of your correspondents agree that the astride position is by far the safest, and to get this position the saddle is the obvious way. The difficulty, however, seems to be a method of fixing the saddle to the rear of the machine.
J. E. JONES.

[A pillion adapter is marketed by Cundle's, 26-28, Byrom Street, Liverpool, at 6s. 9d.—ED.]

ROAD-DESTROYING TYRES.

Sir,—I am afraid "Surveyor" is rather hard on the pneumatic tyre. Has he ever noticed what twin solid tyres do on a tar covered road? It is more noticeable than on macadam; in hot weather there are two furrows with a high ridge in the centre, so deep sometimes that one can almost allow a sidecar to follow the tracks with hands off. I admit that a pneumatic tyre fitted with steel studs does tear the road up, but even so it only finishes off what the solid tyre has left. BEAVER.
Manchester.

Sir,—Your correspondent signing himself "Surveyor" must be a Rip van Winkle. His observations about the damaging sucking action of pneumatic tyres on roads would, of course, apply to the old-fashioned untarred macadam roads of fifteen or twenty years ago, but on the modern tarred road of to-day the effect of the sucking action is absolutely nil. I am sorry to take a diametrically opposed view to a brother surveyor, but really I disagree entirely with every assertion he makes. In my experience, and I think this is the generally accepted view of most road engineers, the vehicle that does the most damage is the heavy commercial vehicle fitted with solid tyres. The terrific wear and tear on roads nowadays is chiefly due to *impact* of fast, heavy commercial vehicles. It would be interesting to know what were the "best materials" of which the portion of the Bath Road was constructed which was "torn up" by the action of pneumatic tyres during the recent week-end of which "Surveyor" speaks.
GEORGE PLUMMER, A.M.Inst.C.E.

PRICE MAINTENANCE OF SPARES.

Sir,—I should like to convey, through your columns, my congratulations to those who have brought the prices of their machines down to the pre-war level.

They deserve a very successful season next year, and will, I trust, receive every support from the buying public.

However, there is one thing that still requires attention, viz., *spares*. Recently I wrote the makers of the machine that I am at present riding asking if their prices of spares had been reduced, but in reply was told that there had been no reduction, nor was one anticipated.
Cheshire. HUBBLE-BUBBLE.

CASTOR OIL IN ENGINE LUBRICATION.

Sir,—I have been much interested in the letter by Mr. Wright, but to say viscosity plays a minor part in lubrication requires explanation, since the force preventing the surfaces—between which the lubricant is interposed—from coming into contact is evoked by the viscosity of the lubricant. Frictional resistance per unit area of bearing surface is given by $F=\frac{\eta V}{d}$.

η = coefficient of viscosity.
V = relative velocity of surfaces.
d = distance between surfaces.

To prevent d from becoming infinitely small η has to be large. That an engine will attain higher revs. using castor oil than one using a mineral oil is due to this property of viscosity. The high viscosity at high temperatures makes castor oil ideal for speed work. TAN-Y-BWLCH.
Bangor.

H.P. OR FUEL TAX?

Sir,—"XR 3296" seems to think that anyone who rides a motor cycle for pleasure must be fairly wealthy. He says that a man or woman who can afford to pay £50 for a solo or £150 for a sidecar machine can afford to pay an extra 30s. or £4 tax per year. He does not consider the man who has to be content with a pre-historic mount picked up for about £18 or £20. FAIRPLAY.
Smethwick.

Sir,—One of the arguments in favour of imposing a tax on petrol is that motorists will be taxed in proportion to the use they make of the roads.

But will they?

A, B and C set off together for a week's touring, during which they cover 600 miles. A rides a Rat-tat which does 120 miles per gallon; B a Cz-z-z, which does 90, and C a Woff-woff (in poor tune), which only does 60, so that in running the 600 miles A uses 5 gallons, B 6⅔, and C 10. Again, D uses a motor cycle while taking orders in a busy hilly town. He does a lot of stopping and starting on gradients and a good deal of low gear work in getting through the traffic, so that his petrol consumption works out at 40 m.p.g. By the time he has covered 600 miles he will have used 15 gallons of petrol. If the tax is 6d. per gallon A will be taxed 2s. 6d., B 3s. 4d., and C 5s. for same length of journey under same conditions, and D 7s. 6d. for same distance under different conditions. The tax, too, would operate unfairly against motor cyclists as compared with motor lorries and cars. A heavy laden motor lorry, with solid tyres, and a heavy touring car, each doing 12 m.p.g., would do more damage to the road in one 60-mile run than C (above) would do in a dozen runs; yet for those runs the lorry and car would be taxed 2s. 6d. each and C 6s.

At the same time I agree it is unfair that the cost of improving the roads should be borne solely by the present generation of motorists. Why not transfer some of the costs to future ones? It might be done by some such method as the following:—Raise a loan of, say, £50,000,000, repayable in 100 years, to be expended immediately in road improvements. Then a tax graduated on the h.p. basis and sufficient to pay the interest, and 1/100th of the loan could be

imposed each year. This would amount to a quarter of the present tax, and as more and more persons took up the pastime, the tax would be still further reduced. The repayment part of the tax as it accrued year by year could be invested and the interest on it allocated for further improvements or the upkeep of roads.

Of course, this is only a suggestion as to method—not amount. G. G. ACTON.

BORROWED NOMENCLATURE.

Sir,—As a motor cycle is neither a clock nor a musical instrument, it would be interesting to many to know who first applied the words "timing" and "tuning" to motors. Surely "setting" and "adjusting" would be nearer the mark? MUGGINS.

London, E.9.

LIMITATIONS TO SPEED.

Sir,—Mr A. O. Russell deplores the modern tendency to speed and states that the effect of wind resistance set up is extremely detrimental on medical grounds. Especially, one imagines, for those poor dear young men who had to stand in the nasty wet trenches from 1914 onwards.

He then expresses the astounding opinion that if the speed limit were abolished someone would be killed! The local policeman, who is a good man, confirms this view. Possibly the local policeman thinks he will be the one man, but as he is good (oh, rare policeman!), why need he worry?

Finally he remarks that, by reducing the capacity, engine efficiency would be increased. In fact these "babies" would, in a very short time, be sold under a speed guarantee of 60 m.p.h. G. F. W.

Essex.

Sir,—I should like to know who were the motor cyclists who became converted to Mr. Russell's ideas. I shrewdly suspect that they agreed as a means to an end, and that they all breathed a sigh of relief when Mr. Russell had departed. H. T. LANE.

Sir,—With fervid interest I have read Mr. Russell's letter. It's as good as *Punch*. My knees shake when I think of the risks I take by walking in a high wind. My push-bike must be at once equipped with a T.O.M.

G. E. MEADE.

Sir,—I find myself in complete agreement with Mr. Russell's suggestions except in one small point. I consider his suggested cylinder capacity of 250 c.c. for a sidecar outfit to be too high.

Practical experience with my A.B.C. Skootamota and sidecar in Devonshire has convinced me that 150 c.c is ample for all reasonable sidecar touring, provided that a pillion passenger is not carried and that the sidecar is not too heavy.

An inexperienced rider with little tuning ability might find 150 c.c. insufficient for sidecar work. If engines of 250 c.c. are to be allowed, I suggest that the sidecar connections be sealed by the police to prevent the machine being detached and ridden solo.

MIGHTY ATOM.

Newton Abbot.

OFF THE BEATEN TRACK IN BANFFSHIRE.

Comparatively few tourists to Scotland use the more southernly road from Aberdeen to Grantown. Nevertheless, although off the beaten track, the road itself is fairly wide and usually in good condition and the scenery has a fascination of its own.

Sir,—We are much intrigued by the letter from Mr. A. O. Russell on road speeds of over-powered bicycles, and beg, as four of the unbiassedly spectated, to protest against the limits he would impose on us as being excessively high.

We habitually use our Brooklands model 2½ c.c. o.h.v. long stroke Brouglases for road work; they do 1,000 miles to the bottle of 30 u.p., and 100,000 to the bottle of castor oil. In order to observe the speed limit we find it necessary to push them between large towns, and carry them through villages; notwithstanding this, we have each killed our man, to the grave concern of our local police constable, who is another extremely good man—gone wrong (*entre nous*, you know).

We are, we know, silly men, but we were born like it.

Rugby. T. T. ORTOISES.

Sir,—The limitation of solo machines to 150 c.c. and sidecar machines to 250 c.c. would no doubt "bring motor cycling within the means of many more." It would also put out of court a large number of motor cyclists, of whom I am one, who use their machines for travelling, and would, under those circumstances, infinitely rather go by train, or push-bike, or walk. The once-more-repeated fallacy of the small engine, *ipso facto*, being cheaper to run than the large one, is not, I think, worth commenting upon.

London, S.E.1. A.E. 3675.

Sir,—Mr. A. O. Russell rather takes the bun when he proposes limiting the power to 150 c.c. and 250 c.c. for the solo machine and the sidecar machine.

What about *Paterfamilias*, who has to take his wife and several children with him for a joy ride? Has he to stay at home and buy the children a pedal cycle or a scooter each, or has he to take a pony with him to pull the outfit up all the steep hills and to assist in the acceleration?

What "dope" did Mr. Russell use to get his friends to agree with his "silly man" notions? I don't think ordinary Adam's Wine would manage such a feat.

Grimsby. 349 DOUGGIE.

Sir,—If Mr. Russell really believes what he wrote to be true, then no lengthy comment is necessary, as he obviously is one of the small but pernicious band of "cranks" whose sole effort in life is to try to spoil the normal citizen's pleasure by robbing the latter of qualities which Mr. Russell and his disciples will never possess, to wit, the real Britisher's spirit, and, to use an expression that I am sure will meet with Mr. Russell's disapproval, British "guts."

Cheshire. "H.F. 1706."

Sir,—During the past year we have seen some rather ridiculous opinions on the subject of speed and fast machines, but surely Mr. Russell's letter gets a first.

"If the present 20 m.p.h. speed limit were abolished, someone would be killed." Possibly the extremely good local constable, who agrees with Mr. Russell, has a nervy bit of point duty, at which he is not as good as he might be. Nobody, of course, has ever been killed yet.

"RICUMPH."

London, N.W.6.

HUMIDITY AND POWER OUTPUT.

Sir,—I was very interested in "Humidiffuser's" letter, though not as a motorist but as a chemist.

He states that he found that the water droplets broke up into hydrogen and oxygen during the compression. Would he be kind enough to let us know how he found that out?

To me it seems very, very strange for this to happen, because if one starts with a mixture of hydrogen and oxygen and compresses it sufficiently and rapidly—*à la* Diesel ignition—water vapour is formed.

Also the dissociation temperature of water is very high, so high that "Humidiffuser's" cylinder—if it remained one—would be a dazzling white. X.Y.Z.

Handsworth.

Sir,—I have read with great surprise "Humidiffuser's" theory regarding the decomposition of water under compression.

If he finds that a mixture of water vapour, petrol vapour, and air, under compression, results in the water becoming resolved into its constituent gases, oxygen and hydrogen, surely it might be advantageous to have a small boiler working somewhere, say, in the exhaust box, with a tube leading into the air intake of the carburetter. This would prove to be an auxiliary source of fuel, as the mixed oxygen and hydrogen gases formed from the water vapour would be highly explosive, as indeed they are in the proportions as contained, or combined to form water. "Humidiffuser" has, however, lost sight of the fact that when hydrogen burns with an aliquot part of oxygen, water is again formed, so that his reaction might go on *ad infinitum* with the same quantity of water present, that is—if he cares to design an engine for the purpose.

"Humidiffuser" has indeed made a great discovery that he should take immediate steps to patent. I think that the only practicable way of decomposing water known at present is by means of hydrolysis. There are other ways of bringing about decomposition of water vapour, but without the actual separation of its constituents in the pure form. HUMIDICONFUSER.

London, S.E.27.

TOO MANY T.T. RACES?

Sir,—Allow me to enter a—necessarily, owing to my living in India—belated protest against the decision of the A.C.U. to hold a T.T. race for sidecars. This race will mean very large sums of money being spent by makers of machines, tyres and accessories, and these will be eventually recouped out of the pockets of the buying public. As a rider, and therefore a purchaser of tyres and accessories, and as a prospective buyer of new machines in time to come, I strongly object to paying indirectly for the race, to however small an extent. Members of the A.C.U. unconnected with the trade would do the public—and, personally I am inclined to think, the trade too in the long run—a great service if they were to insist upon this light-hearted decision to encourage uncalled-for expenditure being reversed.

It is constantly repeated that the T.T. races are justified by their "improving the breed," but I am unaware of any real evidence to support this view, and should very much like to see some concrete facts in place of the usual generalities. It will be difficult to convince the private owner that they are now much more than advertising on a large scale, or that he gets an adequate return for the money that finally comes out of his pocket. What he wants is a reduction in prices all round, and I believe that this would also be of great benefit to the trade in the long run, and therefore both should be hostile to the new race.

The figures showing the condition of the motor cycle trade quoted by "Ixion" in your issue of October 26th seem to me to indicate that the position is not at all sound, and that the cost of the sidecar T.T. race will not be so spread over a large number of machines as to be negligible. Far from introducing a new one, we should aim at suspending many of the costly races and trials until such time as prices are really well down and the trade is flourishing.

Meanwhile it would make trials of much greater interest and use if competitors who retire were compelled to account accurately and fully for their retirements. At present failures are frequently wrapped in mystery, and as often "magneto trouble" is given as the reason. This becomes less and less convincing to the private owner, who, I should say, finds his magneto remarkably reliable. We hear all about the successes, down to the last accessory that helped, and all about those who had "bad luck." Let us hear, too, all about the failures: they are just as instructive.

A. L. HILL.

AVENUES TO PERFECTION.

Sir,—I have returned from the Olympia Show, disappointed in general with the exhibits. The dazzling glitter everywhere of machines, made apparently rather to sell than to use, did not damp the impression I gained that what progress has been made in design has been gained solely from experience on the T.T. course and Brooklands track, and that those makers whose improvements emanated from successes on the above-named courses have had their designs slavishly copied by the less successful.

Are there *no* motor cycle designers who own and use one machine for, say, 10,000 miles on the road only? They all would seem to be (1) speed fiends, (2) as hard as nails, and (3) patient of trouble. To take just one example: the spring frame. This is less in evidence, if possible, than last year. As the owner of a 595 c.c. Douglas, on which I have used 2⅜in., 2½in., and 3in. tyres at all pressures, and finally fitted a spring frame and now use hard 2⅜in. tyres, my experience is that (with respects to "Ixion"!) no pneumatic tyre, of whatever size or pressure, comes within streets of a spring frame, either for comfort or ability to travel long distances (200-250 m.p.d.) without fatigue.

We still have pneumatic tyres with their attendant potential troubles. (Here may I thank "Surveyor" and Mr. Stuart Leslie, the correspondents who have sufficient temerity and originality to cast doubt on the popular irreplaceability-of-the-pneumatic-tyre fetish, for having done so.)

We still have chains, which, for all their efficiency and superiority over belts, are *not* trouble-free (sole exceptions, F.N and G.S.D.).

We have poppet valves, which stick up when the machine is wanted in a hurry (sole exception, Barr and Stroud).

And the engine "improvements" are largely conversions of the woolly pre-war engine to the high-rev., high-efficiency type, which, personally, I consider—from a purely *touring* point of view—a retrograde step.

In short, there are only two machines for which I would change my four-year-old "Doug.," if I thought the advantage of a "more modern" machine worth the inevitable loss financially—which I do not—the 680 c.c. P.V. and the 698 c.c. Raleigh. Their only advantage over my 'bus is the all-chain drive. AE 8675.

London, S.E.1.

Books & Maps for Motor Cyclists.

Issued in conjunction with *The Motor Cycle.*

"MOTOR CYCLES AND HOW TO MANAGE THEM."
The standard handbook of the motor cycle.
Price net, 2/6. By post, 2/10.

"TWO-STROKE MOTOR CYCLES."
Second Edition. Just Published.
Price net, 2/6. By post, 2/9.

"HINTS AND TIPS FOR MOTOR CYCLISTS."
Eighth Edition. Price net, 2/-. By post, 2/3.

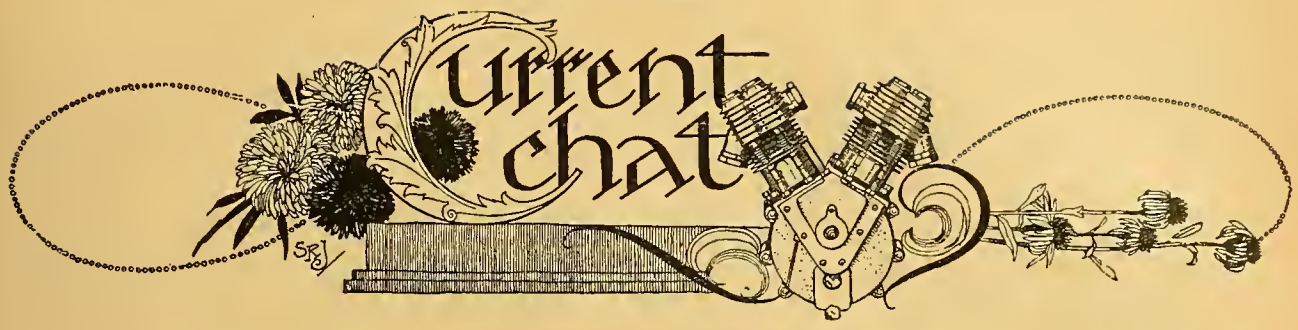
"TRACING MOTOR CYCLE TROUBLES."
Fifth Edition. Just Published: Price net, 2/-. By post, 2/3.

"MOTOR CYCLE REMINISCENCES."
By "Ixion," of *The Motor Cycle.*
Cloth Bound. Price, 5/-. By post, 5/3.
Paper Boards. Price, 2/6. By post, 2/9.

"THE MOTOR CYCLE" ROAD MAPS.
Set of Three Maps—England and Wales, Scotland, London. Set of three, complete in case. Price net, 5/6. Book post, 5/10. Set of Two Maps—England and Wales, London. Price net, 4/6. By post, 4/8.

"THE MOTOR CYCLE" ROUTE BOOK.
With 32 pages of Road Maps. Price net, 2/6. By post, 2/10.

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., Dorset House, Tudor Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls.



Times to Light Lamps.

Dec.	14th	4.19 p.m.
,,	16th	4.20 ,,
,,	18th	4.20 ,,
,,	20th	4.21 ,,

One number plate must be illuminated as above *vide* Road Vehicles Registration and Licensing Order (1921). According to the Lights on Vehicles Regulations (1903) the lamps ordinarily required by law may be lit half an hour later.

Next Thursday.

Next Thursday's issue of *The Motor Cycle* will contain many seasonable Christmas features.

Club Enthusiasm.

Five members of the Richmond and District M.C.C. paraded Richmond streets last week with sandwich boards advertising *The Motor Cycle* film, which is to be shown at the Princes Hall to-day.

The Hospitality of the R.A.C.

At the unofficial luncheon given to the delegates of the international federation of motor cycle clubs, Sir Julian Orde expressed his admiration of the sporting propensities of motor cyclists, and invited the foreign delegates to consider themselves honorary members of the R.A.C. during their visit.

West Country Enthusiasm.

Driving a 1913 Rex sidecar outfit, Mr. A. Liversedge, who only recently took up motor cycling after 30 years of pedal cycling, left Bristol at 6.30 on a Saturday morning for the Motor Cycle Show at Olympia, arrived there at 1 p.m., left at 5 p.m., and reached home again at midnight after considerable trouble owing to his generator freezing. He sends us details of this long trip—for a comparative novice—in confirmation of the recent article on "West Country Enthusiasm."

Power Alcohol from Prickly Pears.

The possibility of obtaining commercial quantities of power alcohol from prickly pears is discussed in the *Times* Trade and Engineering Supplement. There are 2,000,000 acres of prickly pear in the Union of South Africa, and spirit from a formula invented by an Orange Free State farmer has been tested in motor cars of different types and has been reported on very favourably. Government analysts find it free from corrosive or other properties detrimental to engines. Its commercial possibilities have yet to be ascertained, but, if found satisfactory, an annual production of 350,000,000 gallons of spirit is considered possible.

Profitable.

At Woburn it is said that £1,500 has been accumulated in fines inflicted for speed limit and technical motor offences.

Examination for Driving Licenses.

A town council in the Pottery district is seeking parliamentary powers to institute an examination before issuing driving licences.

100 Entries for Winter Trial.

Approximately 100 entries have been received for next Saturday's London-Gloucester-London Trial of the North-West London M.C.C. As last year, there will be a Chilterns non-stop section in the dark.

The Only Way.

Recently a motor cyclist proceeding homewards late at night collided with a coal-cart. He continued his journey, however, and was subsequently stopped by the police for having his number plate inadequately illuminated. He pointed out that his lamp was badly damaged as the result of a crash which had just occurred. "Well, you shouldn't have come out!" was the extraordinary reply.

Eight £25 Machines for £200.

No! said the man with a large family covertly examining the £200 Aero Morgan. I'll buy a fleet of solo machines instead.

New Trade Number Plates.

New patterns of trade number plates, in substitution for the existing type, will be issuable to motor traders by the licensing authorities on and after 1st January, 1923, in connection with the new system of trade licences under Section 15 of the Finance Act, 1922.

O.h.v. J.A.P. Engine Available Soon.

A new type of overhead valve single-cylinder J.A.P. engine is now being put into production by Messrs. J. A. Prestwich and Co., Ltd. It is modelled on the engine which Le Vack has used with such success during the present year, but the valves are operated by long push rods instead of by an overhead camshaft. The 350 c.c. model will be ready for delivery in January.

Another Record Exeter Entry.

The continued popularity of the M.C.C. winter run (London-Exeter and back) is evidenced by the fact that this year 307 entries have been received—ten more than last year. These are made up of 92 solo machines, 93 sidecar outfits, 14 three-wheelers, and 108 cars.

Entrants are warned that particular attention will be paid to noise. Not only will an examination of silencers be made at the start, but travelling and other marshalls will be specially instructed to note the noise of the exhausts, and if a machine is found to possess an inefficient silencer a competitor will run grave risk of disqualification.

Coventry Hospital Motor Ballot.

Results have now been announced of the motor ballot held recently in aid of the Coventry and Warwickshire Hospital. The four premier awards, a Crouch car, a Coventry Mascot sidecar outfit, a Triumph Junior motor cycle, and a McKenzie miniature, went to Mr. J. C. Griffiths, 15, Broadway, Earlsdon, Coventry; Miss Ruth Groom, 3, Howard Street, Coventry; Mr. H. Deacon, 2, Market Place, Nuneaton; and Mr. T. Tunstall, 40, Melbourne Road, Coventry, respectively. The actual result of the voting was: 1, Rover; 2, Rolls-Royce; 3, Standard; 4, Daimler; 5, Morris-Cowley; 6, Humber; 7, Crouch; 8 Morris-Oxford; 9, Calcott; 10, Austin; 11, Sunbeam; 12, Wolseley; 13, Armstrong Siddeley; 14, Singer; 15, Napier.

This Week's Limit.

The man who tried to "weaken the mixture" by diluting his petrol with water.

Excellent!

"The car people do, so why shouldn't we?" say many firms who are now selling their machines completely equipped with electric lighting, etc.

De-tuning for Economy.

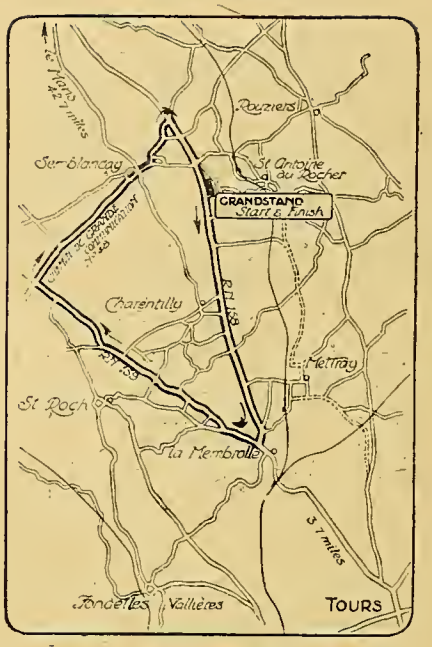
Maximum fuel economy, according to the theorists, is only obtained from a well-tuned engine. On the other hand, we know of a certain o.h.v. engine that gives an additional 10 m.p.g. when its inlet push rod has a $\frac{3}{16}$in. clearance.

Was He Serious?

In reply to an advertisement offering a Morgan for sale, a Welsh reader received a letter beginning "I notis you haff a Morgan's car for sale," and suggesting "a very fine motor bike and 2 ferrets and 1 case of stuffed birds" in exchange.

Among the Accessories.

". . . summoned for riding a motor cycle without an efficient sidecar . . . ." and "lamp sets . . . suitable for exciting lamp brackets"—this week's best misprints—suggest new fields of activity in the accessory market.



Map of the 1923 Grand Prix course.

A.C.U. Horse-power Rating—

At the Olympia Show, as we mentioned, apparently only one firm, and that American, accepted the A.C.U. method of engine rating. Now we have received the 1923 catalogue of a pioneer firm of two-stroke makers who follow the same system. Evidently it is making but slow progress.

—And Another Method.

One maker roundly and vehemently refused to state a horse-power to our representative; he gave the capacity of his engine as 500 c.c. and the power "as much as we can get out of it"!

Help Wanted.

Mr. G. F. Burns, "Lyncairn," Devonshire Park, Birkenhead, hon. secretary of the Liverpool M.C., is anxious to obtain films of motoring interest for the club's gala night at the Trocadero Super Cinema, Liverpool, on the 20th inst.

Carnival Ideas Wanted.

Readers who have decorated motor cycles successfully for a carnival are asked to pass on schemes to a reader who is organising a similar event in aid of his local hospital. His address is Mr. A. H. Richards, Grassington, Wellington, Somerset.

NEXT YEAR'S GRAND PRIX.

14 Miles Circuit near Tours chosen for Big French Race.

FOR the 1923 Grand Prix race, the Automobile Club of France has definitely decided on a triangular circuit lying north-west of Tours, the centre of the Château district of France and a popular region easily reached by road from Le Havre. An idea of its position can be gauged from the fact that its northern corner lies about 180 miles from Havre.

The circuit is 14 miles 240 yards in extent, and consists of the following roads: National Road No. 158 (Tours to Caen), National Road 159 (Tours to Rennes), and Chief Communication Road No. 48. There are three acute turns—that at La Membrolle being encountered at the end of a long descent of 1 in 14.

It is proposed to establish the grandstand near the northern extremity of the western leg of the triangle, one kilometre from the station of St. Antoine du Rocher. The village of La Membrolle is 3.7 miles from Tours.

The motor cycle Grand Prix is usually held before the motor car Grand Prix, (the date of which has not been definitely decided), consequently full advantage is gained of the careful preparation of the roads which is undertaken for the latter.

NORTH LONDON M.C.C. DINNER.

SIR PHILIP LLOYD-GREAME, K.B.E., M.C., M.P., the President of the Board of Trade, attended the third annual dinner of the North London M.C.C., at the Holborn Restaurant, on Saturday in his capacity as president of the club.

In the absence of Mr. Bernard Staley, Mr. A. F. J. Beaurain ably undertook the duties of chairman. Ten toasts in all were proposed, but the speeches were short and to the point, being generally in a humorous vein.

The president confessed that he was not a motor cyclist himself, and told an amusing story of a motor cyclist during the recent election who frantically chased him all round the constituency with a letter marked "Urgent" that turned out to be a request from a lady voter for the prospective member's views on vivisection. He also made some good-humoured comments on the popularity of pillion riding.

In proposing the toast of the President, Mr. A. J. M. Iveson paid tribute to the club's former president, the late Mr. Kennedy Jones, M.P., remarking that the club had always been fortunate in finding officials who took a live interest in its activities.

Later on the lady members were thanked for the important part they played in attending to the social side during the winter months, to which Miss Myrtle Baxter made a suitable reply.

An entertaining musical programme was interspersed between the speeches, a thoroughly enjoyable evening concluding with the presentation by the president of a fine array of cups, trophies, shields, medals, and ash-trays won by members.

HELP FOR THE TYRO.

LONG continued popularity has again called for another edition (the 23rd) of "Motor Cycles and How to Manage Them" (Iliffe and Sons Ltd., 2s. 6d., by post 2s. 9d.).

This much used handbook has been revised once again and deals thoroughly with all those problems which confront the beginner.

The choice of a motor cycle, its care and maintenance, use on the road, minor repairs and tuning, are all dealt with. Motor cycle construction and the functioning of the various parts are discussed and the working of both four-stroke and two-stroke engines is fully explained. A chapter on magnetos is included, which treats the subject fully but simply.

Modern machines have, of course, reached such a high state of reliability that the novice need not prepare himself with a highly specialised mechanical knowledge; nevertheless such information as is contained in the handbook under review is just what it is advisable to have to be independent of external assistance in the event of a temporary derangement.

CLUB NEWS

Bradford M.C. and L.C.C.

Fifty-one enthusiasts started in the club's annual winter trial, which took place on the 10th inst. The 90 miles' course included some stiff hills, notably in the neighbourhood of Pateley Bridge, Greenhow, Appletreewick, and Burnsall. The weather proved much more favourable than on previous occasions, with the result that surfaces were fairly good. Results were not to hand at the time of going to press.

Aberdovey Institute and District M.C.C.

At a general meeting held on the 20th ult. it was unanimously decided to form a club under the above title. Officials were appointed as follows:

Chairman of Committee: Capt. Hieron Kershaw, O.B.E., J.P.
Captain: Mr. A. G. Cocks.
Vice-Captain: Mr. Richard Williams.
Secretary: Mr. McKie.
Treasurer: Mr. J. H. Meirion Jones.

Prospective members should send in their names to the secretary or treasurer.

Dublin Ramblers M.C.C.

The club recently held a series of hill-climbing competitions on a hill near Cornels Court, and included in the programme were two open events. The weather was favourable, and with good fields in the various classes a very enjoyable afternoon's sport was enjoyed. The results of the various classes were as follows:—

CLASS A. (CLOSED).—2-STROKES UP TO 275 C.C.

	Handicap time.
1. H. Phillipson (Enfield), ⅜s. ...	30⅘s.
2. W. Hewett (Enfield), scr.	31⅖s.
3. R. Le Faun (Enfield), ⅝s. ...	33⅜s.

CLASS B. (CLOSED).—ALL TYPES UP TO 350 C.C.

1. S. Woods (Cotton), scr.	19⅜s.
2. W. Hewett (Enfield), 10s.	19⅘s.
3. R. Hill (Velocette), 11s.	25⅖s.

CLASS C. (CLOSED).—351 C.C. TO 650 C.C.

1. C. C. Callaghan (Norton), scr. ...	22½s.
1. J. Hamilton (Humber), 5s. ...	22½s.
3. C. Pitman (Sunbeam), scr.	22⅗s.

CLASS D. (OPEN).—UNLIMITED C.C.

1. W. Hewett (Enfield), 12s.	18s.
2. T. V. Murphy (Coventry-Eagle), 9s.	18⅘s.
3. C. C. Callaghan (Norton), 3s. ...	19s.

CLASS E. (OPEN).—SIDECARS AND CYCLE CARS.

1. D. Allen (Norton sc.), 1s.	29s.
2. C. D. Maguire (Matchless sc), scr. ...	29½s.
3. J. A. Carville (B.S.A. sc.), 3s. ...	30s.

Coventry and District W.M.A.

The termination of a successful season was marked by a general meeting and prize distribution which took place on the 8th inst.

West Kent M.C.

As a conclusion to a very successful season, the annual general meeting will be held on the 23rd inst. at the Swan and Mitre Hotel, Bromley. Next year's policy will be outlined and discussed, and all motorists interested are invited.

Rotherham and District M.C.

A social run will take place on the 17th inst. Particulars of a whist drive and dance and of the annual general meeting, to be held early in the new year, will be announced later. Members are reminded of the new year prize drawing, tickets for which may be obtained from the hon. secretary.

Devizes and District M.C.

The Motor Cycle film will be shown on Saturday and Monday next (the 16th and 18th inst.) at the Palace Theatre, Devizes. Times of showing the film are as follow: Saturday, 2.45 p.m., 5.45 p.m., 8 p.m.; Monday, 5.45 p.m. and 8 p.m. Members of the club wishing to book seats should apply to the joint hon. secretaries, Mr. L. V. Burn, Market Place, Devizes, and Mr. L. K. Lawton, Beach Villa, Devizes.

Challenge cup presented by Mr. G. Packman for competition between University clubs. It was won this year by the Birmingham University M.C.C.

Barrow and District M.C.C.

Nearly one hundred were present at the second annual dinner held on the 7th inst. at the Duke of Edinburgh Hotel. After several speeches had been made, Mr. Bryan Jefferies, chairman of the Northern Centre A.C.U., presented prizes won during the season.

Rochdale and District M.C.C.

A motor cycling club has been formed as above, and affiliation with the A.C.U. is intended. It is intended to run the usual reliability and speed events during the next season. An opening run was held on the 5th inst. under arctic conditions, belt-drive machines becoming completely stranded: it was only owing to the valiant efforts of the captain and vice-captain that some of the unfortunates reached home. Those interested in the club should communicate with Mr. G. G. Wood, Ye Three Cups, Sudden, Rochdale.

Richmond and District M.C.C.

Held under favourable weather conditions on the 19th ult., the club's "Follow-the-Confetti Trial" was a great success. Taken as a whole, the 60-mile course was easy, but a wide water-splash, over a foot deep, stopped practically every competitor. Two observed hills, Pebblecombe and Bagden, were included in the route. First place was taken by R. O. Lowe (490 Norton), whose error at the time checks amounted to only a few seconds; he is therefore the winner of a rose-bowl presented by the Palmer Tyre Co. Second place was taken by R. Harrison (490 Norton). Only three others finished the course.

North West London M.C.

This year's London-Gloucester Trial will take place on Saturday, and will be run on lines similar to those of last year. It has been found impossible to conduct the trial as an open event, but it is being arranged as an inter-club contest. Up to the present the following clubs (in addition to the promoting one) have entered:—Coventry and Warwickshire M.C.C., Essex M.C., and Surbiton and District M.C.C., there being 100 riders.

In order that the participants and officials in the London-Gloucester trial may meet as soon as possible after the event to recount experiences, a social meeting at Berkhampstead has been arranged for the 17th. Tea will be taken at the King's Head Hotel, Berkhampstead, at 4 p.m., and it is hoped that as many as possible will attend. In view of the increasing use of motor cycles among schoolboys the club is promoting a competition open to students at the recognised public schools and to those who are entered for such schools. The club has a membership for schoolboys at a fee of 5s., which allows participation in the club events during the regular school holidays.

Shirebrook M.C.

The Motor Cycle film is being shown at Shirebrook Empire by the above club to-day (the 14th inst.).

Levis Athletic Club.

Full results of the Levis single gear are now to hand, and are given below in order of merit:—1, A. R. Edwards (211 Levis), 204 marks; 1st Class "A," winner Yardley Cup and Godfrey gold medal. 2, S. Jones (Samjo), 204 marks; 1st Class "B," silver medal for best performance in class, also premier prize (belt) for best performance by a private owner on a machine between 250 and 350 c.c. in Classes "B" and "C." 3, G. S. Davison (211 Levis), 201 marks; 2nd Class "A," bronze medal. 4, E. C. Myhill (211 Levis), 184 marks; special medal for best performance on observed hills. 5, J. Knibbs (247 Levis), 176 marks; 1st Class "C," silver medal, also silver medal for best performance on Levis with 26in. wheels. 6, W. S. Hawcutt (211 Levis), 176 marks; 2nd Class "B," bronze medal. 7, P. Platts (490 Norton), 158 marks. 8, N. D. Pickering (499 Triumph), 152 marks; 2nd Class "C," bronze medal. 9, D. S. Griffiths (211 Levis), 142 marks; premier prize for best performance by a private owner on a machine up to 250 c.c. in Classes "B" and "C." 10, J. H. V. Wood (499 Triumph), 140 marks; premier prize for best performance by a private owner on a machine over 350 c.c. in Classes "B" and "C." 11, F. E. Thacker (498 Singer), 130 marks. 12, F. L. Edmonds (211 Levis), 125 marks. 13, J. Robinson (499 Triumph), 90 marks. Special medal for best performance under adverse conditions in any class was awarded to A. Manley, junr. (292 Rades-Union). Team prize won by A. R. Edwards' team (G. S. Davison, A. R. Edwards, Sam Jones).

Cheshire Centre A.C.U.

Official awards made in the one day open trial held on October 21st are as follows:—

SILVER CUP, awarded by J. Crowther Walker, Esq., for best performance.—J. Graham Oates (248 Grindlay).

CHESHIRE CENTRE CHAMPIONSHIP.—J. Graham Oates (248 Grindlay).

CLASS AWARDS.

250 c.c.—J. Graham Oates (248 Grindlay), gold medal.

350 c.c.—J. B. Donaldson (348 Raleigh), gold medal; E. Foster (348 Raleigh), silver medal; J. H. Roberts (348 Scale-Blackburne), certificate.

500 c.c.—S. Smith (492 Sunbeam), gold medal; S. A. Crabtree (492 Sunbeam), silver medal; G. L. Falck (499 Rover), silver medal; W. E. Smithies (490 Norton), certificate; P. G. Thomason (398 A.B.C.), certificate; L. Randles (492 Sunbeam), certificate.

750 c.c.—Miss Cottle (547 Powell), gold medal; C. Guthrie (698 Raleigh), silver medal; S. Baldwin (490 Norton), certificate.

UNLIMITED.—P. C. Ralli (976 Brough Superior), gold medal.

600 c.c. SIDECARS.—M. Gavson (550 Triumph sc.), gold medal.

UNLIMITED SIDECARS.—P. Platt (749 Bradbury sc.), gold medal.

CYCLE CARS.—B. Davenport (1,087 G.N.), gold medal.

AWARDS FOR COMPLETING COURSE WITHOUT LOSS OF MARKS.—J. Graham Oates (248 Grindlay), gold medal; S. Smith (492 Sunbeam), gold medal.

Mid-Bucks M.C.C.

The club's annual dinner and prize distribution took place recently at the Bull's Head Hotel, Aylesbury. After a number of bright speeches had been made the chairman presented four cups and twenty-three medals won by members during the past season.

Oxford M.C.

Several well-known figures in the motoring world will be present at the club's annual dinner, to be held at the Clarendon Hotel, Oxford, on Saturday next (the 16th inst.), at 6 p.m. An excellent musical programme is also promised. Tickets (7s. 6d.) may be obtained from Mr. E. J. E. Knowles, 36, Holywell Street, Oxford.

Richmond and District M.C.C.

It is hoped that every member will do his best to "turn up" and see *The Motor Cycle* film at Princes Hall, Richmond, to-night (the 14th) at 7.30 p.m., and so ensure a jolly evening. The film will be followed by a dance. Those who have not yet bought tickets will be able to do so at the door.

Cardiff M.C.C.

The annual dinner will be held on Saturday next (the 16th inst.) at the Royal Hotel, Cardiff. A wireless concert will be given during the dinner. Tickets (price 10s. 6d.) are obtainable from the hon. secretary, Mr. A. Davies, 91, Penywain Road, Roath, Cardiff. Results of a trial for the Webber Cup, run off on the 18th ult., are as follows:—

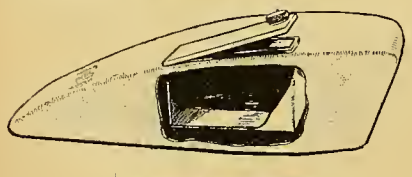
WEBBER CUP AND GOLD MEDAL.—R. S. Bevan (996 New Hudson three-wheeler).

85 M.P.H. FOUR-CYLINDER.

Improvements to the 1922 Ace. Introduction of a Sporting Model.

THERE are few more interesting or fascinating machines on the market than the four-cylinder Ace, which is designed by Mr. W. G. Henderson, a name long connected with four-cylinder motor cycles.

Only those who have driven a four-cylinder machine can fully appreciate its charm of smooth running, wonderful acceleration, and flexibility. To the man who has not, such a machine as the Ace, weighing 365lb., might seem to be so unwieldy as to be uncomfortable, but we can assure him that once inertia has been overcome the riding balance is perfect. Few of us are trick riders or want to emulate the performances of the Ace experts, but it is distinctly interesting to know that this machine can be turned in about one-third of the width of an average street with the rider leaning over to such an angle that the footboards are within one inch of the ground.



Tool box in petrol tank.

The Ace engine and gear box follow car practice right through. The 1,229 c.c. (68.58 mm. × 82.55 mm.) engine in its latest form still preserves the feature of overhead inlet valves, with the result that since the inlet is directly over the exhaust the incoming charge cools the latter; this system also allows the sparking plug to be situated so that its points are well within the inlet chamber and are constantly swept by the incoming charge. The large 1½ in. valves with ¼ in. lift are in cages which are separate castings made in pairs, while the actuating mechanism, consisting of rockers and tappet rods, is enclosed in a casing provided with a door which, when pushed back over dead centre, remains open.

Lubrication is effected by means of a mechanical oil pump driven off the main timing pinion and disclosed by removing the front engine cover. Since the timing wheels are not contained in a separate chamber, on the cover being removed not only the oil pump, but the whole of the interior of the crank case is visible.

Lubrication.

The primary function of the oil pump is to distribute the oil under pressure to the big ends, which dip into troughs, while the main bearings are oiled by means of a gap formed in the casting, which leads the lubricant to the bearing surfaces. Lubrication is therefore mainly on the splash system, and the pump also supplies oil for the clutch and transmission.

Contained in the rear portion of the crank case is a three-speed gear, a plate clutch being mounted car fashion on the end of the engine shaft.

From engine to back wheel the transmission is by single chain.

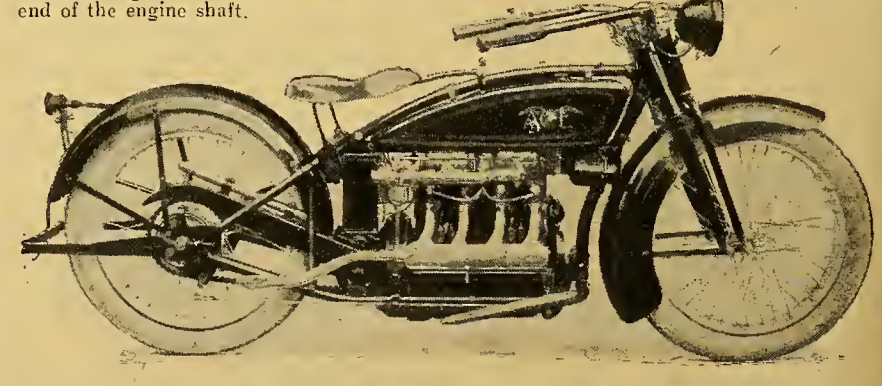
Strongly constructed and of the duplex variety, the frame is built of 1⅛in. heavy gauge tubing. There is no saddle pillar, but vertical struts serve as extra supports between the chain stays and back forks, and, moreover, steady the engine in the frame.

Another interesting feature of the Ace is a three-gallon tank, which incorporates a spacious tool compartment.

Both brakes are of the external contracting variety working on two drums, one on each side of the rear hub.

The price of the standard Ace is £125, a sports model sold at £132 being fitted with aluminium alloy pistons, lightened connecting rods, sharper angle cams, and a slightly higher compression. No vital points are lightened, yet the more expensive model is guaranteed to attain a speed of 85 m.p.h.

Ace motor cycles are being handled in this country by Robertsons Motors, Ltd., 159b, Great Portland St., London, W.1.



85 m.p.h. is guaranteed from this sports model four-cylinder Ace.

THE FUTURE OF THE SHOW.

Movement to Make the Motor Cycle Exhibition a Biennial Event.

IT will probably come as a surprise to many of the motor cycle public that a number of the exhibitors at the recent Olympia Show are desirous of making this important event a biennial, instead of an annual, fixture. Indeed, in some quarters it was recommended that the next motor cycle exhibition should not be held until 1925. We understand that the manufacturers responsible for this suggestion (and some of the most prominent firms are included) circulated a "round robin" to this effect during Show week.

As to the wisdom of this course, our views are given in a leading article on page 911. The annual Show is a firmly-rooted fixture, and it is undoubtedly much more than the mere social reunion which some people allege it has lately become. It affords a valuable means of bringing the motor cycle movement into prominence, and gives tangible proof of the importance to which the industry has attained.

It is said that home sales of new machines from the middle of August until the spring are few and far between. Prospective purchasers, if approached, say they would prefer to wait until they see the next year's models at the Show in November. When the Show arrives it is frequently apparent that the "new" models are, to all intents and purposes, identical with those of the current season. Here and there is something entirely novel, but, in the majority of cases, such machines are not bought in any quantity until they have proved themselves in open competition.

It is claimed in certain quarters, therefore, that the Show actually tends to curtail sales during the period of the year when the motor cycle manufacturer is most in need of business. Some makers, in fact, would prefer to list their models by a distinguishing symbol instead of by the year of manufacture. The "Model X," for instance, might be current during two or three years, a guarantee to this effect being advertised by the maker from time to time. Such a procedure, it is claimed, would benefit the purchaser, because the second-hand value of his machine would depend only upon its condition, and not vary arbitrarily with its year of manufacure. Entirely new models would make their *début* in competitions.

The foregoing puts forward the views of a minority. The majority appear to appreciate more fully the value of the Show both as a means of popularising the motor cycle movement and for giving opportunity to buyers to see their goods and to compare them with their contemporaries.

MANVILLE TROPHY TRIAL.

ON Saturday the annual Manville Trophy Trial of the Coventry and Warwickshire Motor Club was re-run, the previous run a few weeks ago having been cancelled owing to the number of competitors losing their way, a very intricate course and insufficient marking being the cause of this.

The marking of the course last week-end was good.

Starting from Coventry the route was plain sailing for the first 40 miles, lying through Warwick, Stratford-on-Avon, Mickleton and Weston to Saintbury, where the first time-check 30 miles from the start was held. Immediately following the check, Saintbury Hill was ascended, a stop and restart test taking place just before the second bend. Seldom has this hill been seen in a more treacherously greasy condition, the same remark applying to practically the whole of the course throughout the day. However, performances on the hill were good, as also was the restarting, despite the surface.

Well-known Hills.

Turning sharp right at the top of the hill, Willersey was descended, and then on through Broadway and Winchcombe, turning off the main road here and going up Sudeley Hill.

Bearing right at the top of Sudeley, the course led through several gates and over a fairly rough surface to Brockhampton. Fog encountered after the top of Sudeley Hill made riders who were unacquainted with this section of rough "going" rather wary, but it was not thick enough to be a great hindrance; one could always see fifteen or twenty yards ahead, and very soon the sun was making an effort to get through. The course now lay through Andoversford to Birdlip, a time check being held at the top of Birdlip Hill.

Immediately after the check an acceleration test was held, competitors being timed over a distance of about a hundred yards from a standing start. Through Cranham, a sharp left-hand turn down a narrow rough lane, Stancombe Hill was reached. Although this hill might be expected to cause failures, particularly amongst the sidecars (from wheel-slip), there was not a single stop recorded. The surface was completely hidden by a thick carpet of brown wet leaves. F. T. Sibley (499 Rudge sc.) had his passenger practically on the carrier for wheel-grip.

Stroud was reached four miles further, where the lunch check was held. Several competitors had failed to maintain their average over the last section, and lost several minutes at the lunch check. Amongst these were: D. Radford (688 Coventry Victor), S. A. Thomson (550 Triumph) and J. L. Hardy (Humber).

Cotswold's Difficulties.

It was rumoured during lunch that a 20 mile an hour average was going to be a difficult thing for the 12½ mile section before the next check, and such proved to be the case. Wall's Quarry Hill was the first obstacle after lunch, three miles out of Stroud. Although not an officially observed hill, it accounted for many failures and a great loss of time.

In less than a mile Knapp Hill was encountered: the surface was a thin slime, as was to be expected. No sidecar succeeded in getting up, but there were some creditable solo performances. Amongst the latter, the following made clean and steady ascents:—D. Radford (688 Coventry Victor), W. L. Danskin (499 Rudge), P. H. Johnson (499 Rudge), A. J. Elliot (249 Rover), L. Crisp (600 Humber), H. J. Stretton Ward (499 Triumph), H. S. Perry (349 B.S.A.), M. Scally (600 Humber). E. A. Barnett (346 Francis-Barnett) touched once, tackling the hill a little too fast, and otherwise made a clean ascent. R. Grindlay (600 Humber) and S. A. Thomson (550 Triumph) footed to steady themselves, as did J. W. Moxon (348 Monopole).

Amongst the sidecars, B. Kershaw (346 New Imperial sc.) climbed the highest, and W. J. Montgomery (976 Brough Superior sc.) only failed after a valiant effort. Wheel-slip was the sole cause of failure, of course.

After Knapp, the Nailsworth "W" was climbed, and thence on through Amberley to St. Chloes Lane. This again caused trouble with several sidecars. At the check at the top of Woodchester Hill there were very few competitors up to time. From Woodchester the course lay through Paganshill and Whiteshill to Portway Hill. At the top of Portway was the finishing check. Very few competitors reached this to their schedule time, so difficult had been the afternoon's run—although only 24 miles long!

1923 INTERNATIONAL TRIALS.

Scandinavia as a Testing Ground; Rule of the Road and Speed Limits; No Steam Rollers in the Country!

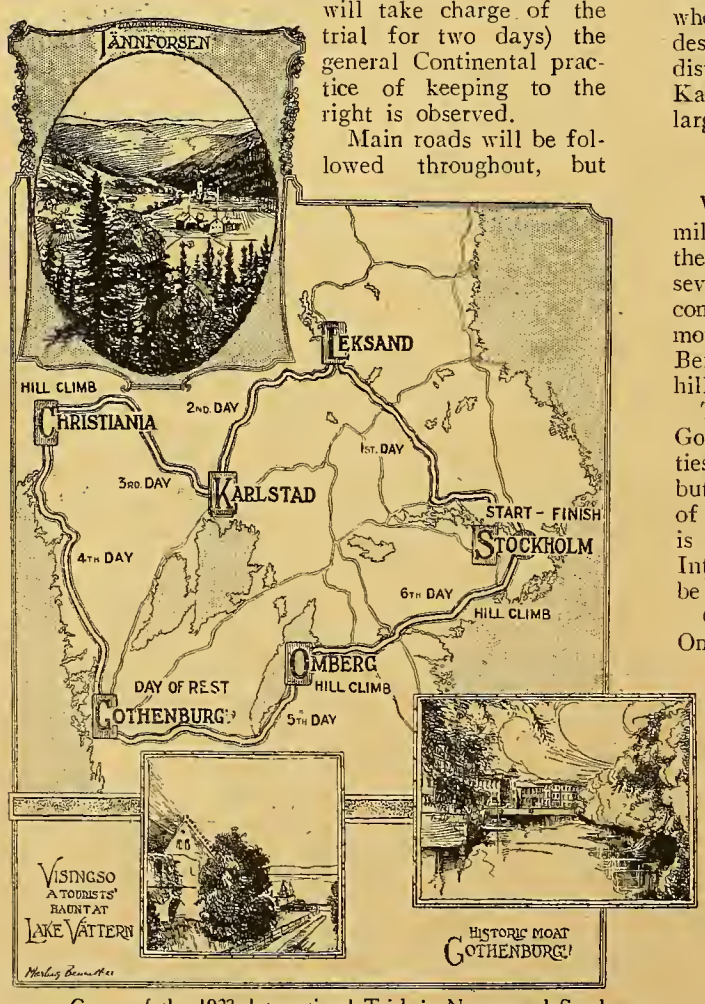
ONE of the delegates who attended the recent F.I.C.M. meeting in London was Mr. G. K. H. Anderson, who is chairman of the Competitions Committee of the *Svenska Motocykel Klubben*. Mr. Anderson, who is exceedingly enthusiastic over the coming International Six Days Trials which his club is organising in Sweden, gave us some useful information concerning the nature of the roads to be traversed by the competitors, as well as about conditions generally in his country.

There is no doubt that there are many keen motor cyclists in Sweden, and it is quite evident that British machines, properly represented, would find a ready sale on account of their reliability and suitability for rough usage.

"Keep to the Left" Rule of the Road.

British competitors should have no traffic difficulties in Sweden as the rule of the road is the same as in Great Britain, but in Norway (where the Norwegian Club will take charge of the trial for two days) the general Continental practice of keeping to the right is observed.

Main roads will be followed throughout, but Swedish main roads are very much different from those in England; it is said that there is not a steam roller in the country. The legal limit of speed in Sweden is about 25 m.p.h., but in Norway it is only 18½ m.p.h., and these limits are, of course, reduced in towns. The time schedules will be worked accordingly, while the roads will be marked by blue dye.



Course of the 1923 International Trials in Norway and Sweden.

Over 200 Miles on the First Day.

The event starts on August 6th, and the first day's run of 218½ miles will be from Stockholm to Leksand, on the shores of the Lake of Siljan, a tourist centre in the heart of Dalecarlia, a very beautiful district where the peasants still wear the national costume. Lunch will probably be at Vasteras. The roads are good all the way. The route for the next day is from Leksand to Karlstad (175 miles). For some distance the roads are good, and the beautiful country of South Dalecarlia will be traversed. Later on, however, deep sand will be encountered. Then forests will be passed where the road is better. Before reaching their destination the competitors will pass through a mining district, where iron is produced in great quantities. Karlstad is situated at the head of Lake Vänern, the largest lake in Europe.

A Hill Climb in Norway.

Wednesday's run from Karlstad to Christiania (180 miles) will probably be long remembered, as it marks the entrance into a mountainous region, increasing in severity as the Norwegian frontier is approached. The competitors will lunch in Norway, a land of high mountains, rushing rivers and picturesque waterfalls. Before Christiania is reached there will be an observed hill-climb.

The following day's route, from Christiania to Gothenburg (220.5 miles), should present few difficulties. About one-third of it is in Norwegian territory, but the lunch stop will be in Sweden. The remainder of the journey lies over ordinary roads. Gothenburg is one of the principal ports of Sweden, and as an International Exhibition will be in progress there will be a day of rest for the competitors.

On Saturday the journey is from Gothenburg to Omberg (152 miles). From the starting point to Jönköping the road is rough, stony, and full of pot-holes, but nearing Omberg (a pretty town situated on a high hill overlooking Lake Vättern) it improves considerably.

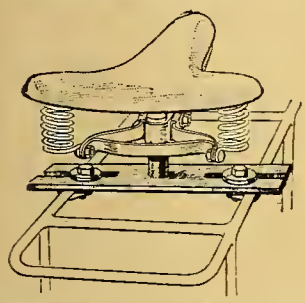
Flying Kilometre Speed Trial.

On the final day's run from Omberg to Stockholm (169 miles), the road is said to be good all the way, and there are not many hills, save one known as Sillerskogen, which is short and steep and contains hairpin corners. Before reaching Stockholm there will be a flying kilometre speed trial on the Isle of Mörkö.

The total length of the route is 1,115 miles.

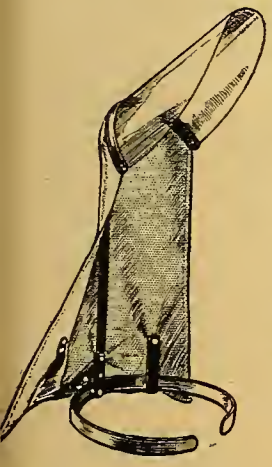
AMONG THE ACCESSORIES.

Saddle as Pillion Seat.



Simply an adaptor that allows an ordinary saddle to be attached to the carrier as a pillion seat, the Cundle device is marketed at 6s. 9d. by Cundle's, 26-28 Byrom Street, Liverpool.

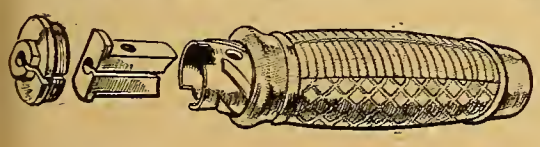
Face Screen Attached to Rider.



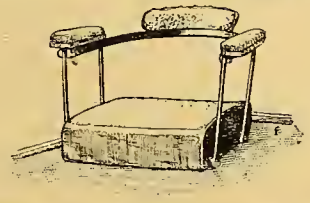
Something new in weather protecting devices for the motor cyclist is the Bristol face screen and chest apron, the whole being carried on a spring strap on the rider's waist. It is easily detachable and weighs only 18 ozs. (The Bristol Sidecar and Motor Co., 11, Stokes Croft, Bristol.)

Twist Grip for Single Lever Carburetters.

Brown & Barlow, Ltd., manufacturers of the well-known B. & B. carburetter, have introduced a simple form of twist grip control for one-lever instruments.

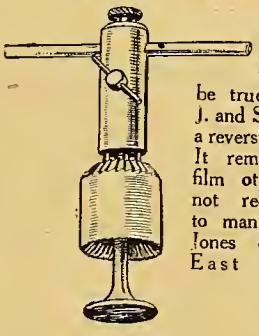


For the Extra Passenger.



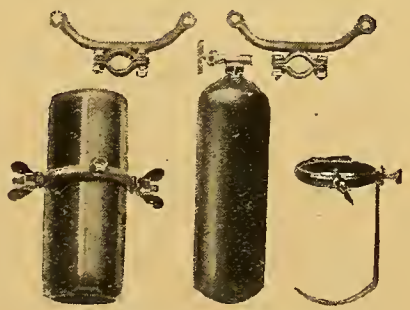
Padded back and arm rests give this Saxillary pillion seat quite an armchair appearance. 35s. (Saxelbys, Ltd. [Saxessories], George Street Works, Coventry.)

Valve Care Facilitated.



Both valve and valve seating may be trued up with the J. and S. tool, which has a reversible milling cutter. It removes a very fine film of metal and does not require an expert to manipulate it. A. A. Jones & Shipman Ltd. East Park Road, Leicester.

Dissolved Acetylene for Motor Cycles.



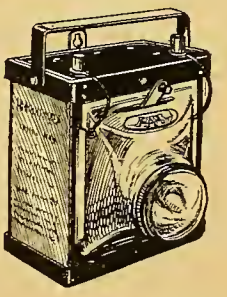
As already announced in "The Motor Cycle," motor cycle sizes of dissolved acetylene cylinders are now available. (Allen-Liversidge, Ltd., 106, Victoria Street, London, S.W.1.)

Balanced Speedometer-watch Mounting.

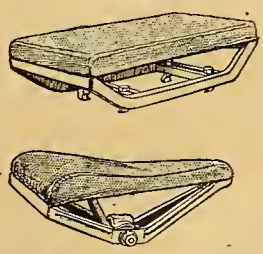
It is claimed that the watch mounted integrally with the latest Smith speedometer "balances" the whole instrument on the handle-bar. £4 10s. 0d. complete. (Smith's (M.A.), Ltd. (S. Smith & Sons (M.A.), Ltd.), Cricklewood Works, London, N.W.2.)

Lasting Inspection Lamp.

Noted for the long life of its battery, the H. H. hand lamp is now offered in an improved form at 22s. 6d. (A. H. Hunt Ltd., H. A. H. Works, Tunstall Road, East Croydon.)



Lightweight Saddles and Pillion Seats.



Particularly light weight is an attribute of both the Austin saddle and the pillion seat, which have aluminium frameworks. They weigh 4½ lb. and 5 lb. respectively. (A. T. Austin, Eckersall Rd., King's Norton, Birmingham.)

21st ANNIVERSARY DINNER OF THE M.C.C.

Reminiscences of Club Life in 1901. Origin of Classic Runs.

MANY gallons of petrol have been used since the Motor Cycling Club was formed by those gallant enthusiasts of 1901, who laid the foundation of the largest club of its kind in Great Britain, and that it has lasted for twenty-one years as a going concern is no small item to its credit. Not only has it lasted; it has grown in strength and prosperity.

Its annual dinner and 21st anniversary, last Thursday, was largely attended by members and their guests, who completely filled the big hall of the Wharnecliffe Rooms at the Great Central Hotel, Marylebone. It was gratifying to see so many of the older members present.

A Ladies' M.C.C.?

The chair was occupied by Mr. J. K. Starley, the club's president, who, after proposing the toast of "The King," proposed that of the "Health of the Motor Cycling Club." His was an amusing speech, in the course of which he referred to the club's competitions, which fostered a sporting spirit of the highest possible form. Few people realised the beneficial effects of such runs and trials on business and employment. In his opinion the Motor Cycling Club was the finest sporting organisation which existed. The chairman concluded by asking why the ladies did not form their own branch of the M.C.C. and run their own competitions.

In reply, the present chairman of the club, Mr. C. S. Baddeley, stated that he rose with a certain amount of diffidence to reply to the toast of the evening. One jagged edge in a season of unbroken success was caused by the death of Mr. Robert Head, one of the club's most wise and just counsellors. He also had to deplore the absence of Mr. Arthur Candler.

As regards reminiscences, Mr. Baddeley referred to Mr. J. van Hooydonk as the originator of the London-Edinburgh Run (a statement corrected later, the originator being Mr. Arthur Candler); the London-Exeter Run was "discovered" by Mr. E. B. Dickson (now in India); while the London-Land's End Trial was, he believed, a joint affair originated by Mr. H. G. Bell and himself.

Further reminiscences of twenty-one years ago were then given by some of the older officials, but these were sadly interrupted by an unruly portion of the gathering.

Mr. Ernest Arnott, first captain of the M.C.C., said that it was nineteen years since he had had anything to do with motor cycles, regarding which his chief recollection were of flat belts, surface carburetters, and hard pedalling. He had competed in the Circuit des Ardennes. Van Hooydonk was there and he had got the better of him. He remembered Mr. Charles Jarrott's advice that the best thing to do in a race was to get to the finish, as it often happened in those days that a finisher had an excellent chance of being the winner.

Mr. J. H. Reeves, one of the earlier secretaries, said that his acquaintance with the Motor Cycling Club dated from the first day of the S. F. Edge Cup Trials in 1903. During his term of office he had hoped to get 200 members but he was disappointed, and that happy event was left to his successor, Mr. Arthur Candler. He well remembered the grief of the then treasurer, Mr. E. Marsh, at the conclusion of the 1904 London-Edinburgh run when he discovered that the club would have to find the money for 22 gold medals. He also referred to the early history of the Team Trial Trophy, concerning which he was approached by Mr. B. H. Davies (*The Motor Cycle*), whose wit had largely added to the success of The Motor Cycling Club Gazette, of which he held a bound copy in his hand. That journal would be deposited in the South Kensington Museum.

Mr. Charles Jarrott, for many years the club's president, also "reminisced." Twenty-five years ago, he said, motor cyclists went into the unknown on unknown machines. As those present were aware, the greatest offence that could be committed in London by any user of the streets was to pass a refuge on the left side. He well remembered an occasion when an offending motor tricyclist had committed this heinous crime and the arm of the law had with disastrous results attempted to pull him back by grasping the cylinder. He also told how Mr. A. J. Wilson (who was present that evening) first appeared with a tricycle which had so fierce a clutch that every time he let it in the driver fell off behind.

Early Difficulties.

Mr. J. van Hooydonk told some interesting stories of the club's early history. How the first treasurer ran off with the club's money; how at the Bexhill speed trials the police trapped the members on their way down, and how, to ensure an easy start, the speed trials were started downhill, but that even then many of the machines failed to fire. He correctly ascribed the origin of the Edinburgh run to Mr. Arthur Candler, whose idea was then thought to be perfectly insane. The great success of the run was largely due to the fact that they first approached the police in all the counties traversed, with the result that they were given every assistance. He would remind his audience that in 1904 the run started from the G.P.O., and that when he left the timekeeper with Mr. G. E. Roberts (also present) as his passenger in a Trimo, the betting was 200 to 1 against their getting through.

Following the speeches came the distribution of the prizes and finally a dance.

"THE MOTOR CYCLE" FILM.

Many Appreciations. 800 Witness First Northern Exhibition. Where to See it Next Week.

APPRECIATIONS from many of those who have already seen *The Motor Cycle* film have reached us by almost every post since the Show when the film was first shown at the Broadway Cinema, Hammersmith. One enthusiast, whose letter is typical, writes:

> "Allow me to congratulate all concerned in the production of *The Motor Cycle* film. I consider it to be a really fine piece of work and a film which should appeal to every motor cyclist worthy of the name, as it enables the man in the street to form a good idea of the reliability of the modern machine. I have but one criticism to make, which I heard expressed by more than one member of the audience last Wednesday, namely, 'What a pity there isn't more of it!'"

The first club to receive the Northern film was the Southport Motor Club, and it was exhibited on the evening of the 6th inst. at the Coliseum Cinema, Southport. Over 800 people witnessed it, and at an informal meeting of the Southport M.C. afterwards the committee expressed appreciation for the film, which had undoubtedly done a great deal for the club.

Where to see the Film.

To-day (Thursday) the Southern film is being exhibited by the Richmond and District M.C. at the Princes Hall, Richmond; on Saturday (16th) and Monday (18th) the Devizes and District M.C. will show it at the Electric Theatre, Devizes; Tuesday (19th), the Abingdon Kinema, Stert Street, Abingdon; Wednesday (20th), the Yeovil and District M.C.C., at the Central Hall Picture Palace, Yeovil; while on Thursday (21st), the West Kent M.C. will have the film on exhibition at the Grand Hall Cinema, High Street, Bromley.

The Northern film will be shown during the present week by the following clubs: To-day by the Shirebrook M.C. at Shirebrook Empire, Shirebrook; to-morrow, the Matlock and W. Derbyshire M. & M.C.C., at the Matlock Picture Palace; on Saturday (16th), the Stafford and District M.C.C.; Monday (18th), North Derbyshire M.C.C., at the Coliseum, Chatsworth Road, Chesterfield; Tuesday (19th), the Blackpool and Fylde M.C., the Tripoli Picture House, Blackpool; Wednesday (20th), the Liverpool M.C., the Trocadero Super-Cinema, Liverpool; and on Thursday (21st), the Saltcoats and District M.C.C., at La Scala Picture House, Saltcoats.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 1½d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the top left-hand corner of the envelope, and should be kept distinct from questions bearing on technical subjects.

ROUTES.—By special arrangement with the Automobile Association and Motor Union, readers of "The Motor Cycle" desiring routes may enjoy the benefit of the Road Service Department of that organisation. Queries should be addressed to the Editor in the ordinary way (enclosing a 1½d. stamp), and will be dealt with by the A.A. and M.U., who are regularly in receipt of reports from their representatives all over the country as to the existing state of the roads in any particular locality.

OBSOLETE ENGINE AND WIRED TYRES.

(1) Where are parts for a Fafnir motor cycle obtainable? (2) Are "wired" tyres still manufactured? (3) Would "beaded edge" tyres (26×2¼in.) fit 26×2in. rims for wired tyres?—P.G.

(1) So far as we know it is now impossible to obtain spare parts for Fafnir engines. (2) Very few of the British tyre manufacturers have continued to make wired tyres in motor cycle sizes. Possibly some could be made specially. (3) Beaded edged tyres cannot be fitted to "wired on" rims; your best plan is to have the wheels rebuilt with beaded rims. This would not be expensive.

LONG EXHAUST PIPE ENTHUSIASM.

Is it legal for me to run a Rudge-Multi without a silencing box if the exhaust pipe extends beyond the back wheel? If so, what distance must the exhaust pipe extend behind the back wheel? If I want a Rudge-Multi without a silencer, must I order it especially, or are they made like that?—R.A.R.

There is no legal definition of a silencer other than it must be an apparatus sufficient for reducing the noise of the exhaust to reasonable proportions. Long pipes are not regarded as "sufficient" in most cases. The standard machines are fitted with silencers; if you *must* have a straight-through exhaust pipe you will have to fit it after removing the standard exhaust system.

50° MAGNETO ON 45° ENGINE.

I have a twin Rex motor cycle which has been running perfectly on accumulator and coil ignition. Lately I bought a 50° magneto, and have fitted it and timed it to fire at top dead centre when the control is two-thirds retarded, but I find it very difficult to start when cold. Once it is warm it runs perfectly. I have since received information from the makers to the effect that the cylinders are set at 45°; would this make any difference to the starting?—R.V.M.

In all probability the starting trouble is due partly to the fact that the magneto is not of the correct angle, and also that the spark of the magneto is weak at low speeds. You do not say the make of the magneto, but if the contact breaker cams are detachable it would be easy to have them ground off to make the necessary slight correction for the difference in angle. Any reputable magneto repairing concern should do this for you at a low cost. The magneto might be re-magnetised with advantage.

Important Dates.

Tues., Dec. 26th and Wed., Dec. 27th—M.C.C. London-Exeter Run.

Sat., Jan. 13th to Wed., Jan. 24th—The Belgian Salon.

Fri., Jan. 26th to Sat., Feb. 3rd—Scottish Motor Show.

Sat., Feb. 24th—Colmore Cup Trial.

Wed., March 14th—A.C.U. Stock Machine Trial.

Sat., Mar. 17th—Victory Cup Trial.

Fri., March 30th and Sat., March 31st—M.C.C. London-Land's End Run.

Fri., May 18th—M.C.C. London-Edinburgh Run.

Mon., June 11th—Junior T.T. Race.

Wed., June 13th—Lightweight T.T. Race and Sidecar T.T. Race.

Fri., June 15th—Senior T.T. Race.

Sat., July 21st—B.M.C.R.C. 500 Miles Race.

SMALL CAR PROGRESSION

"THE AUTOCAR"—published from the offices of "THE MOTOR CYCLE" and conducted on the same enterprising lines—is the complete automobile journal embracing small, medium, and large cars. Every motor cyclist contemplating the purchase of a light car should read

The Autocar

Every Friday 4d.

Founded in 1895, "THE AUTOCAR" is the largest and most successful automobile paper and enjoys the greatest circulation. It is universally accepted as the representative British motoring journal.

OUT OF TUNE.

I have a single-cylinder Humber with two-speed hub gear, which, when it has run, say, a mile on high gear, begins to tick and appears to be over-heated, and finally stops of its own accord.—E.P.

From your brief description the cause of your trouble would appear to be due to faulty lubrication in conjunction, probably, with general lack of tune. You do not say what oil you are using, but a thinner grade might improve matters during the cold weather. This symptom of over-heating and "getting tired" is often caused by excessive carbon deposit in the engine, by a faulty plug or by bad compression due to worn valves or piston rings. A general engine overhaul including decarbonisation, grinding in the valves, tappet clearance adjustment, and fitting new rings and valve springs, should restore the machine to normal running.

RATIO AND TIMING FOR SIDECAR.

On the back wheel of my 550 c.c. Triumph sidecar (year 1917 or 1918) I have fitted a 28×3in. tyre in place of the 26×2¾in. When going up an incline or against a fairly strong head wind the machine seems to lack power and tends to knock, although it is free from carbon. The spark is timed rather more retarded than usual. There are 15 teeth on the engine sprocket and 30 on gear box, while the circumference of the pulley is 25in. and the belt drum 61in., which, I believe, gives a top gear of 4.88 to 1. (1) Is it advisable to fit a smaller engine sprocket. If so, with how many teeth? (2) What is the correct valve and ignition timing?—E.J.C.

(1) The machine should be quite capable of drawing a sidecar with the gear ratio now in use, and it would not be advisable in any case to use a smaller sprocket than 14 teeth. (2) The correct magneto timing is as follows:—With the ignition control lever about two-thirds retarded the contact breaker points should be just commencing to open when the piston is on top dead centre. The valve timing is as follows:—The inlet valve should be just opening and the exhaust valve just closing when the piston is at top dead centre. The change in tyre size should not have an appreciable effect on the running of the machine.

OIL LEAKAGES.

(1) Does oil leaking from the cylinder-crankcase joint and also from the oil pipe on the front cylinder make any difference to power? (2) When I half fill my gear box, the oil is thrown all over back wheel and my coat. How can this be remedied?—H.J.S.

(1) Loss of power will not be caused unless the engine is receiving insufficient oil. (2) We should advise using a mixture of half oil and light grease (*not* heavy) for the gear box lubrication. This would probably remedy the "oil-slinging" of which you complain.

FIRST STAGES WITH A TWO-STROKE.

(1) Is castor oil suitable for lubricating the 1920 Clyno two-stroke engine (lubrication is petroil)? (2) How long must I carefully run in the engine? (3) Can I fix a 26×2¼in. tyre on to the back wheel, as 26×2in. is rather on the small side? (4) If the machine is in good tune, what speed should I get under good conditions? (5) Can I get spares from the makers?—W. R. D.

(1) You should use mineral oils for the petroil lubrication system. (2) If the engine is new and unused, about 400 to 500 miles. (3) A 26×2¼in. tyre will fit the 26×2in. rim, but you should make quite sure that there is sufficient clearance between the latter and the mudguards for the larger size tyre. (4) About 40 m.p.h. (5) Spares are obtainable.

HORSE-POWER RATING.

I notice that the 1922 models of the single-cylinder Rover, although apparently with the same engine as my 1919 model (bore and stroke, 85×88 mm.), are rated as "4 h.p." What is the reason for this, and am I entitled to do the same?—G.B.

No doubt an improvement in power output justifies the makers in now calling their machine a "4 h.p." model. As a matter of fact, you will notice that we have discontinued to classify machines by arbitrary "horse-power" ratings, as classification by cubical capacity obviates any confusion which may arise.

EXPERIENCES WANTED.

Readers' replies to questions published under this heading should be addressed c/o The Editor, "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4, when they will be forwarded direct to the querists concerned. Requests for experiences should be accompanied by a stamp.

"W.R.B." (Northampton). — 211 c.c. Levis, "Popular" model: suitability for beginner.

"F.M." (Address Wanted.—Ed.).—799 c.c. A.J.S. two-seater sidecar: side-pull, alignment, and tyre wear as compared with single-seater and pillion.

"D.A.J." (Lancaster). — Grado pulley (with or without K.S.) on heavy solo machine.

"W.T." (Merton).—499 c.c. Dunelt sidecar: long journeys with heavy loads.

"W.H.B." (Dartford).—Union, Orbit, or T.D.C. two-stroke engines, single geared.

"D.J.S." (Ramsgate).—993 c.c. Matchless sidecar: spring frame, electric lighting.

"T.W.B." (Grove Park).—490 c.c. Norton and 998 c.c. sports Harley-Davidson: suitable carburetter.

"J.P.B." (Sheffield).—1,301 c.c. Henderson with heavy sidecar in hilly country: ease of obtaining spares.

"E.E.S." (Leicester).—557 c.c. and 770 c.c. B.S.A. for dual-purpose work

"A.B.C." (Middlesbrough).—398 c.c. A.B.C.: tuning for speed and slow running.

SPARKLETS.

Scottish Motor Show.

The Scottish Motor Show will be held at the Kelvin Hall, Glasgow, and not in Edinburgh, as previously reported.

Protest Upheld.

J. H. Davies (492 Sunbeam) has now been awarded a gold medal for his performance in the Liverpool M.C. Reliance Cup Trial.

Change of Address.

Stanley Parker, the well-known northern rider, informs us that the business of Parker's, automobile engineers, has now been transferred to the fine building, Nos. 246-252, Deansgate, Manchester, previously occupied by the North British Rubber Co.

Cheaper Cycle Cars.

Owing to an increasing number of orders Tamplin Motors, Ltd., have reduced the price of the Tamplin cycle car to £136 10s.

New Polish.

Dunhill's, Ltd., have marketed a polish for enamelled or coachwork surfaces, for which very excellent results are claimed. It is bottled at 2s. and 3s. 9d.

Windscreen Prices.

Current revised list prices of the Sandum V-shaped windscreens are as follows: Standard, £3 10s.; Popular, £2 10s.; Super (opening with door), £3 12s. 6d.; combined hood and screen, £4.

Price Reductions.

Solo and sidecar prices of the 496 c.c. Lea-Francis are now £77 10s. and £99 15s. respectively.

Considerable reductions in prices are announced in Brooks' saddles and equipment, as sold by J. B. Brooks & Co., Ltd., Great Charles Street, Birmingham.

Cata'ogues Received.

Seal Motors, Ltd., 348, Stretford Road, Manchester.—Catalogue of the Seal Sociable, the price of which is now £145.

Dunhill's, Ltd., 359-361, Euston Road, London, N.W.1.—A complete review of Dunhill triangular frame sidecar chassis and bodies.

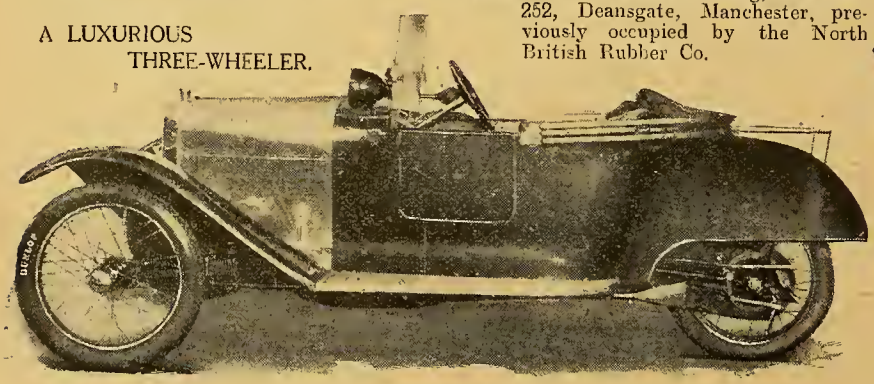
The Skefko Ball Bearing Co., Ltd., Luton, Beds.—Descriptive catalogue of ball bearings chiefly of interest to the manufacturer.

Dunford & Elliott (Sheffield), Ltd., Bath Street, Birmingham.—A folder giving details of all the various model Dunelt motor cycles, with full particulars and prices.

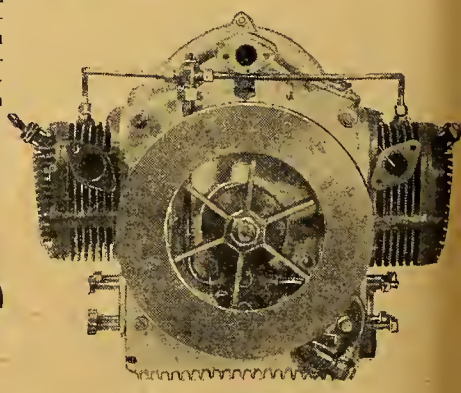
Norton Motors, Ltd., Bracebridge Street, Birmingham.—Illustrated booklet telling the prospective purchaser all he wants to know concerning the popular Norton models.

The Whitley Manufacturing Co., Ltd., Charterhouse Mills, London Road, Coventry.—List of sidecars, chain adjuster for use with Sturmey-Archer gear boxes, a foot control for clutches on Sturmey-Archer gear boxes, and spare plug carriers.

A LUXURIOUS THREE-WHEELER.



Fitted with a 1,098 c.c. water-cooled M.A.G. engine, the New Hudson three-wheeler is one of the most highly developed machines of its type. In specification it is a complete small car on three wheels. The drive is by shaft to a three-speed and reverse gear box, the final reduction being by chain.



OIL-COOLED FLAT-TWIN FOR CYCLE CARS.

Bradshaw oil-cooled flat-twin engine for lightweight runabouts. In the 750 c.c. class, it has side valves entirely enclosed in the crankcase extensions, and it is available with a four-speed and reverse unit gear box.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words 3/-, and 3d. for every additional word. Paragraphs of under 8 words are charged double rate. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable to ILIFFE & SONS Ltd., and crossed & Co. Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle" by the first post on Friday morning previous to the day of issue. Advertisements that arrive too late for a particular issue or that are crowded out will automatically be inserted in the following issue unless accompanied by instructions to the contrary.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4. *Readers who reply to Box No. advertisements are warned against sending remittance through the post except in registered envelopes; in all such cases the use of the Deposit System is recommended, and the envelope should be clearly marked "Deposit Department."*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the machine offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor. Carriage is to be paid by the buyer, but in the event of no sale each party pays carriage one way. The seller takes the risk of damage in transit. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, 1%. All deposit matters are dealt with at Dorset House, Tudor Street, London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

A.B.C.

59 Guineas; easy terms, exchanges.—A.B.C. 1921 coachbuilt combination, everything fitted.—Wandsworth Motor Exchange, Ebner St., Wandsworth (Town Station). [4819

The Sign of Good Service

WHEN DO YOU WANT THAT NEW MACHINE?

IF IMMEDIATELY:

Make your choice from Godfrey's unique stock of 1923 models. The machine, registration, licence, insurance—everything, in fact—ready within an hour or so.

IF NEXT MONTH, THE MONTH AFTER, OR LATER STILL:

Place your order with Godfrey's now, and by the date appointed your new model, solo or combination, will be waiting for you. You will not be expected to pay until you take delivery.

Sterling values and low, stabilised prices mean an enormous demand. That is why we advise our friends to ORDER NOW.

Secure these 1923 models whilst available.

Matador.

MATADORS are creating a sensation by reason of their wonderful value. Don't be left without one for the spring. Orders are rolling in daily.

A 2¾h.p. o.h.v. Bradshaw engined machine that can do 60 miles per hour with ease is a machine to be seriously considered. The finish is exceptionally good, the tyres are Dunlop 700×80, the mudguards sensibly wide, Burman 3-speed, clutch, and kick-starter. There is a host of other good points. Come along and see it.

AT £75 they are excellent value.

ALLAN GRUZELIER, Ulster Chambers, 168, Regent St., W.1, know a good thing when they see it! Come and see it too.

A FEW Agencies still open in London, Surrey, Sussex. [4810

Matchless.

MATCHLESS.—Actually in stock, 1923, 3h.p. sports; £70.—The Layton Garages, 30, Holywell St., Oxford. [4783

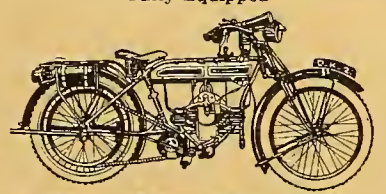
GREAT BURLINGTON COMPETITION

in which we are presenting this

2¾ h.p. Burlington Douglas

Fully Equipped



FREE

TO further popularise our well-known Sidecars, we have instituted the following interesting competition, in order to obtain a really good slogan for these Sidecars.

NOTE.—The type of slogan required is something similar to "Luxury Products at Economy Prices," or "Best on the Long Run."

All that is necessary is to send in your suggestion for a slogan, accompanied by an order for goods to the value of not less than 2/6.

Every 2/6 entitles you to send a suggestion.

An abbreviated List of spares and useful accessories will be found under our advertisement in the Miscellaneous columns.

BURLINGTON SIDECARS

renowned for their distinctive design, their elegance, and their roomy comfort. Can be supplied on Cash or Deferred Payments.

May we send you a catalogue?

"GOOD THINGS" for CHRISTMAS, COMFORT, & PROTECTION

WATERPROOF MOTOR CYCLE SUIT WITH FLEECE LINING.

Fig. 1.

Fig. 1.

SPECIFICATION.

MADE from hard-wearing double texture fawn material with an interlining of Rubber. Double Breasted Jacket, with all-round Belt and Leather Buckle, large Patch Pockets, and converted collar to button right up to neck, to fasten with Throat Tab. Wind Cuffs in sleeves. All seams of the Suit are rubber cemented and taped with extra material, making the garment absolutely waterproof. Overall Trousers with spat-shaped leg; wind gussets to keep the wind from the leg and boots; fastened with patent clasp fasteners, enabling the trousers to be pulled off in a moment. The Jacket is fitted with warm and cosy fleecy lining and can be detached when not required. This suit is constructed to fully protect the rider from chill, as well as being WATERPROOF.

State chest measurement and height when ordering.

Suit complete with Jacket (fleece lined) and Overalls	**45/-**	Without fleece 35/-
Suit complete with Jacket (fleece lined) and Seatless Trousers	**52/-**	Without fleece 42/-

NO EXTRA CHARGE FOR CARRIAGE.

WATERPROOF TRENCH COAT WITH DETACHABLE FLEECE LINING.

Fig. 2.

SPECIFICATION.

MADE of fawn material, rubber lined, with all-round belt and buckle. Convertible collar, wind cuffs in sleeves, and fitted with warm, woolly, detachable fleece lining. An ideal coat for motor cycling, walking, and all outdoor purposes. This garment is impervious to rain, comfortable and warm for winter wear.

FLEECE LINING CAN BE DETACHED.

PRICE, FLEECE LINED 37/6

Without fleece lining 25/-

Should you prefer to see patterns before ordering, these will be sent by return on receipt of a postcard.

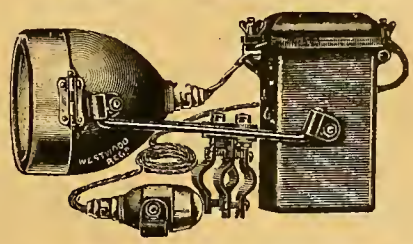
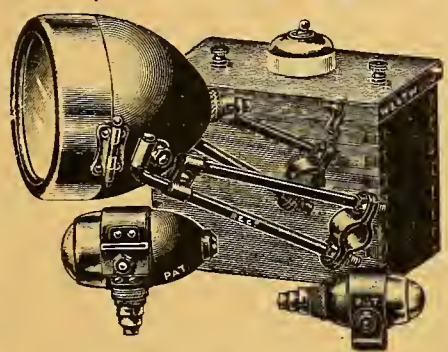
"DAYBEAM" Electric Solo Set



The Headlamp supplied with this set is our 5in. Daybeam, a very powerful light-giver. The brackets are of exceptionally strong and handsome design. They carry the headlamp and also the (die cast) aluminium case. The accumulator is specially made for motor cycle lighting, and will brilliantly illuminate the head and the rear lamp for 20 hours if used intermittently. The tail lamp (our torpedo S.B.C.) is exceptionally strong and well made, and has a very attractive appearance. Each lamp is fitted with a switch, and one lamp may be used independently of the other. The outfit is despatched completely assembled, and 4 volt bulbs are fitted. The finish is ebony black and nickel plate.

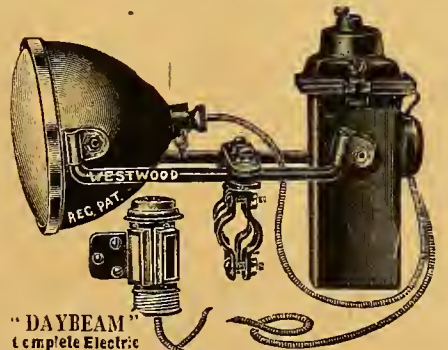
Complete Outfit, List No. 30/1, Price £5 5 0

"DAYBEAM" Combination Set



The set comprises Daybeam 7in. Headlamp, Ideal Sidecar Lamp, and Torpedo S.B.C. Tail Lamp. Each lamp is fitted with an independent switch, and is finished in ebony black with nickel-plated relief. The accumulator (capacity, 6 volt, 40 amp.) is specially made for motor cycle lighting, and will give very satisfactory service in use.

Complete Outfits, List No. 30/2, Price £7 7 0



"DAYBEAM" Complete Electric Set for Lightweights.

Solo Outfit, £3 3s.
Combination Outfit, £3 15s.

THE BEST OF XMAS PRESENTS IS A Douglas Motor Cycle

It is so useful and at the same time the source of such healthful enjoyment all the year round.
The 2¾ H.P. Douglas, fully equipped with Lamps, Horn, etc., at £50 is cheaper than pre-war price, and is the best value that money can buy.
It will pay you to purchase from me because I am a Douglas Specialist, and will tune your machine and guarantee you satisfaction. Cash or terms to suit you.
I can supply the special Douglas fitted with Zoom ! Zoom ! ! Exhaust System, Alloy Air Cooled Valve Caps, Aluminium Combined Footboards and Footrests, Special Valve Springs, Special Pistons, and fully equipped, and GUARANTEED TO DO 55 m.p.h. for £52.
Write me for the 1923 Douglas Catalogue.—You can select a Douglas Motor Cycle to exactly meet your individual requirements.
You can select a more moderate but very useful present for Douglas riders from the following range of my specialities.

PATENTED TWIN RINGS. Two rings in each groove give more power—perfectly gas-tight joints—prevent carbonising as oil cannot pass them—wear indefinitely—need no running in.

For 2¾ h.p. Douglas, **1/6** each; 4 h.p. Douglas, 3 h.p. Royal Ruby, Williamson, and Humber Twin, **1/8** each; 4 h.p. Sunbeam, Triumph (pre 1919), B.S.A., New Hudson, Rudge, Precision, Singer, etc., 85 × 3 m/m, **1/9** each. All Blackburne engines, Triumph (post 1919), Rover, Premier, Dunelt two-stroke, etc., 85 × 2 m/m, **1/9** each. All 2¾ h.p. J.A.P. engines, 2¾ in. × 3/32 in. **1/8** each. Other sizes quoted for on application.

ZOOM ! ZOOM ! ! The popular Exhaust System. Beautifully made, finished in burnished nickel or copper. A pleasant Zooming note without back pressure. Adds pounds to the appearance of any Douglas. Price 30/- in copper finish, 33/6 nickel.

ADDITIONAL POWER may be obtained by fitting Special Lightweight Radiated Pistons, fitted with patented twin rings. They are simply wonderful, and every mail brings testimonials from all classes of satisfied riders. Price **29/-** per pair, complete with gudgeon, twin rings and copper caps.

THIS BEAUTIFULLY-SHAPED PAN SADDLE with adjustable springs gives you a low natural riding position and does not foul the sidecar stay. My price **25/-** Usual price 35/-.

THE TONY COMBINED ALUMINIUM FOOTBOARD AND FOOTRESTS. Beautifully finished—giving a natural riding position. A real solid cast job. Something that lasts for ever. Price **30/-** per pair complete.

AIR COOLED VALVE CAPS. My latest are covered by patents. They never blow out nor seize in the threads. Absolutely gas-tight. Prevent knocking and keep the engine cool. Try them on your 2¾ h.p. or 4 h.p. Douglas, and if you are not absolutely satisfied have your money back. Price **4/-** each.

BARREL VALVE SPRINGS. These springs prevent bouncing, and lighten the work on the cam. They are unbreakable and flexible. For 2¾ h.p. Dougs. Racing **2/-** per pair; touring **1/6** per pair. Do not compare these with the cheap springs that are flooding the market.

Any Spare Part by return of Post.
4 h.p. and 2¾ h.p. **INSTRUCTION BOOKS, 1/6** each.

BROLER 3½h.p. 2-stroke Engine.—The standard engine that can lap Brooklands track at 51 m.p.h. after 7,000 miles on the road. Important Reduction in Prices. In order to bring our production within the reach of a greater proportion of the public we are, for one month only, offering this engine at £9. This price includes patent release valve, exhaust pipe and cast aluminium silencer, magneto platform (one-nut chain adjustment), magneto chain and sprockets, cast aluminium chain case (grease-tight), Lodge T.S.3 plug, ⅞in. or 1in. belt pulley—sprocket 4/- extra. These engines are fitted with Skefko ball bearings to main shaft, and Hoffmann rollers to big end. These engines are not a job line, but are a standard engineering production, all parts being interchangeable. Write for illustrated catalogue and be convinced.—Broler Motors, Ltd., Narborough, Leics. [4381

IGNITION, LIGHTING, ETC.

AN Amazing Offer.

COUNTY of London Engineering Works, Ltd.

WE hold the largest and most varied stock of magnetos and spare parts in England; our stock comprises over 30,000 magnetos, and an inside estimate of our spare is £250,000.

WE would bring to your notice that these magnetos are not old, disused magnetos painted on the outside to look like new, like many being offered to the public by so-called magneto specialists and experts, but are new unused Government surplus, and every magneto previous to being sold is thoroughly overhauled and subjected to the same test as by the makers.

GUARANTEE.—These magnetos are all fully guaranteed for twelve months against all defects, and should any magneto at any time within this period prove in any way defective we will willingly exchange or repair same free of charge.

APPROVAL.—Notice all goods sent on approval for 14 days, per return or post on receipt of cash, and in the unlikely event of these goods not meeting with your entire satisfaction we will refund cash in full, making no deductions for packing or carriage. Magnetos dispatched through this paper's deposit system if required.

BOSCH Z.E.1, Z.E.2, and Z.E.V., all degrees; £5.

BOSCH Z.A.2; £3/17/6.

BOSCH Z.U.1 and Z.U.2; £6.

BOSCH D.U.2, open type; £4/10.

122, Shortlands Road,
Sittingbourne, Kent.
August 17, 1922.

Mr. Brodrick,
The South-Western Appliance Co.

Dear Sir,

The St. Helier Building arrived on Saturday, two days before promise of delivery, and we are more than satisfied with it.

We erected it on Wednesday and it went together like clockwork. I am very pleased we left the order with you, as all who have seen it think the value is remarkable and admire the artistic appearance. Trusting and believing it will get you further orders from this district.

Yours faithfully,
THOS. E. KENNETT.

RELIANCE Magneto Repairing Co.

RELIANCE for Repairs, new magnetos, and spare parts of every description.

RELIANCE have the largest and most up-to-date repair factory in London or Provinces.

RELIANCE carry out all repairs on the premises, including armature winding. Trade inquiries solicited.

RELIANCE have one of the most modern armature-winding plants and test rooms in the country, and can therefore offer you the following advantages:—

TIME.—All work within 6 to 48 hours, and a solid 12 months' guarantee in writing to back it up.

CHARGES.—No flat rates. You are charged according to the work that is required; therefore you are not in some cases helping to pay for other people's repairs.

OUR Offer.—We shall be pleased to allow you to see your magnete on test after repair at our works. How many others can make the same offer?

RELIANCE have the following magnetos in stock, all fully guaranteed and on approval.

THOMSON-BENNETT.—Singles and twins, new, any degree, waterproof, variable, suit any engine; price 55/-.

C.A.V. Singles and Twins, new, ideal for any lightweight, 2¾h.p. and 4h.p. Douglas; 55/-.

BOSCH, Type Z.A.2, second-hand, enclosed, waterproof, variable, latest pattern, for Douglas 2¾h.p. and 4 h.p.; £4/10.

ACCUMULATORS, best makes only, for all purposes, any veltage, charged and uncharged, always in stock; send for prices.

BOSCH Enclosed, waterproof, type D.A.L. magnetos, Government surplus, any degree, ready to fit on Indian, Harley, J.A.P., or any big single or twin. We guarantee these to give you slow running and easy starting, and they are in every way ideal for the big machine; price, carriage paid, £4/10.

GUARANTEE.—Every magneto, no matter what the price or make, is guaranteed by us. Not merely that same is in good order at time of sale, but a plainly written statement that we guarantee each machine against all defects for a period of 12 months. This, we maintain, justifies us in charging a few shillings more than certain of our competitors. List sent post free upon application.

RELIANCE were established in 1914, since when we have enjoyed a reputation which is second to none for straight and fair dealing.

IGNITION, LIGHTING, ETC.

MAGDYNAMO Engineering Co., Ltd., for magnetos, spares and repairs.

MOTOR Cyclists fit reliable high quality magnetos now and avoid certain failure of inferior magnetos.

BOSCH Enclosed Waterproof Type D.A.L. Magnetos, Government surplus, ready to fit on Indian, Harley, J.A.P., or any big single or twin, gives powerful spark at all engine speeds, makes your engine a real live engine, give you easy starting, smooth and rapid acceleration, high speed, and low fuel and oil consumption with increased power; price only £5 each, postage 1/6 extra; a 12 months' written guarantee sent out with each magneto. We give you satisfaction or refund cash.

PLEASE note the above type magnetos were originally manufactured for 200h.p. aircraft engines; therefore we have every confidence in claiming them to be the magneto you require for your big machine. Fit one to-day, and see life with a live machine.

HARLEY-DAVIDSON Owner writes: "Magneto to hand; many thanks for prompt despatch, satisfactory in every way; will recommend to my friends."

ZENITH Owner writes: "Since fitting magneto have completed a run of 250 miles; highly satisfied; will certainly recommend these magnetos."

INDIAN Machine Owners.—Your high-class machine deserves a high-class magneto. We want 1,000 Dixie 42° magnetos; send your magneto and £4 now, and we will immediately despatch you a Bosch D.A.L.

READY to fit on your machine; there are no alterations to make.

WHY is it that the leading Motor Cyclists—the men who know—are almost all sending to us for their Magnetos?

THERE must be a reason; there is; it is because the Magnetos of quality and guaranteed service, supplied by Magdynamo, beat all other Magnetos.

MAGDYNAMO will take your old Magneto in part payment.

REMEMBER your magneto is sent on 14 days' approval against cash per return on receipt of your order; there is no obligation to keep it until you have used it for 14 days on your machine and are satisfied; let us send you one now.

ARE You a Discerning Douglas Owner? Do you want a reliable magneto with 12 months' guaranteed service that will give you starting without worry, a smoother running, and more powerful engine and better results from your Douglas? Then send for a latest enclosed waterproof type Bosch XA2 magneto now; price only £5, carriage 1/6.

C.A.V. Magnetos (not converted starters), ready to fit on Triumphs, B.S.A.'s, Nortons, and P. and M.'s, with 12 months' guaranteed service, price £3/10, carriage 1/6.

THOMSON-BENNETT Magnetos latest enclosed waterproof type (not converted starters), ready to fit on 55° Clynos and 180° Douglas machines, with 12 months' guaranteed service, price £3/10, carriage 1/6.

MOTOR Cycle and Car Owners, are you testing all your sparking plugs properly? Are you wasting pounds yearly by throwing away good plugs? Fit a Bosch aeroplane hand starter magneto on your garage bench to-day and always have your sparking plug tester at hand, price £2, carriage 1/6.

TRADE discounts and export quotations.—Write, call, or 'phone for terms.

A YEAR'S guarantee on repairs. Before you scrap that magneto, whatever its condition, let us see it; we will rebuild your magneto to look and work like new, no matter what make, within 3 days or 24 hours if urgent, and return it with a written 12 months' guarantee. While your magneto is being repaired we can lend you another free of charge. We could not make these offers if we were not certain of the quality of our work.

YOUR old magneto will be equivalent to new at a low cost. Send us your defective magneto now.

EXPRESS Dixie Repair Service. Your Dixie magneto, no matter what size, rebuilt equal to new and returned in 12 hours, at 30/-; a small extra charge for necessary replacements.

C.A.V. Express Repair Department.—Your C.A.V. magneto, no matter what type, rebuilt equal to new and guaranteed for one year, returned in 12 hours, at 30/-; a small extra charge for necessary replacements.

ARMATURE rewinding, no matter what make, type, or size, 11/6. Wound cores from stock.

IT'S not what you pay, but—what it pays you that makes your magneto and dynamo overhauls cheap. If you want high-grade magneto and dynamo repairs that pays you send your faulty machines to us.

MAGDYNAMO for quality.

Winter Trials.

LAST Saturday's London-Gloucester and next week's London-Exeter runs demonstrate by their large entries that winter competitions, properly run, may be very successful. They also serve several useful purposes, notably demonstrating that the motor cycle is not a mere fine-weather machine for use in the summer months.

Ordinary roads, such as the ordinary all-weather motor cyclist uses, become difficult enough to ensure that only a good rider on a good machine scores full marks. Thus the old objection to many trials, *i.e.*, that no sane man would wish to take a motor cycle over the freakish lanes and hills included, disappears without leaving an event too easy to be of any practical value.

Lamps, too, are tested, and from our observations they are at present often found wanting. More night trials would help greatly the production of reliable and effective forms of lighting for motor cycles.

Mudguarding, too, is bound to improve by the intensive testing of motor cycles under the worst conditions of winter, especially when the route selected leads away from the tarred main roads on to the water-bound macadam lanes of the country.

Christmas 1922.

IT is now four years since the Armistice was signed and motor cycle matters assumed their normal aspect. The period intervening proved one of unexampled difficulty, first a boom and then an inevitable slackening in demand. The year 1922 has not proved so full of prosperity as everyone anticipated.

At this season optimism usually runs high—higher perhaps than is sometimes justified. This Christmas, however, optimism has a more substantial foundation, for there are definite signs of a revival of trade. We are not referring specifically to the production of motor cycles, but rather to industry generally. Any improvement in trade must reflect upon the British motor cycle industry, perhaps proportionately more greatly than upon any other individual industry not confined to the production of the absolute essential.

The interest in motor cycles continues to increase, and this at a time when one might have expected it to abate owing to trade depression. It only requires a slight impetus to national prosperity for 1923 to exceed any preceding year in the numbers of motor cycles which will take the road.

There is every justification for optimism. The British Empire is successfully emerging from one of the most difficult phases in its history, and the motor cycle industry, we sincerely think, may regard "bad trade" as a thing of the past.

It is the pleasant duty of *The Motor Cycle* to be of service to rider and manufacturer alike and to help forward the motor cycle movement by every means in its power. Its campaigns for genuine improvement have borne fruit, and the ever-increasing number of readers encourages us in the belief that our efforts to help, to record history and to assist in its making, to entertain and, sometimes, to amuse, are appreciated.

Our heartiest greetings go alike to all those interested in motor cycles. To manufacturers we extend the hope that all their plans may be successful; to agents, that their efforts will be supported by both rider and maker; and to riders we say: May you obtain the object of your desires; may you spend many happy days awheel.

And to *every* reader, at home, in overseas dominions, and in far-off foreign lands: A Happy Christmas!

An index to the advertisements in this issue will be found on the page facing the back cover.

OCCASIONAL COMMENTS

by "Ixion"

Greeting!

HEARTY good wishes for a merry Christmas to all my readers, critical, appreciative, and bored sniff. May a pale British sun (December model) camouflage the extreme cold of the afternoon as they manfully take the road after far too much dinner, and help them to pretend that they are enjoying themselves. For myself, I have chopped a huge limb off the ancestral holly in the back yard of Benzole Villa. I have filtered half a pint of aviation wherewith to illuminate the pudding. I have locked up the garage, lost the key, and disconnected the telephone in case the editor should suddenly require my services (which is his abominable habit on public festivals). All the motor cycling I shall do on Christmas Day is to open parcels. I circulated my list of wants round my relatives and acquaintances in good time, and I sincerely hope that my place at the dinner table will be fortified with a great sangar of parcels. Lots of new gadgets. Large cheque from pa-in-law (I sent him a box of Coronas in *very* good time). Etc., etc., etc. But the open road? Archibald, certainly not!

A White Christmas.

PREACHERS and publicists often croak to the effect that Englishmen are becoming decadent. The climate certainly is. I can remember when nearly every Christmas was a white Christmas. But latterly the most the Exeter procession has had to contend with is fog and rain. It would be rather a rag if sometime a real snowstorm would suddenly descend upon these unfortunates, say, about Sherborne or Chard, and bury the roads thigh deep. Not if it were my job to report it, of course; except that I should probably learn quite a lot of new swears; and a good reserve of cusses comes in very handy for a motor cyclist on occasions, doesn't it? Suppose by the law of averages it will happen some day, won't it? And *what* fun we shall have! Wish I hadn't thought of it. But, you see, I am going to Exeter this year. Solo, too.

"Ixion's" "MOTOR CYCLE REMINISCENCES" are available in book form, price 2s. 9d. post free, from "The Motor Cycle" Offices, Dorset House, Tudor Street, E.C.4.

Who Is It?

ONE of the latest metallurgical processes is known as Pescol, and consists of building up a worn metal part, such as a crankshaft, with nickel, iron, or copper to its original dimensions. The treatment is largely analogous to electro-plating, though the details are secret, and there are several points worthy of mention. Being a cold treatment, it does not spoil heat-treated steels. The deposit does not peel off after the manner of cheap plating, or of plating which has been "done too thick"; for when a deposited part is tested to destruction, a film of the underlying metal comes away with the deposit. The deposit can be case-hardened, if desired. I am informed that a well-known racing motor cyclist is experimenting with nickel-plated valves *à la* Pescol in order to avoid oxidisation and pitting on long-distance records.

Thoughtless.

AS a journalist of some standing (ahem!) I expect, and sometimes receive, deferential treatment from firms in the trade. The other day I ordered one of the well-known dynamo-less accumulator lighting sets for a steed in my stud. It duly arrived, and after unpacking I fell a-musing as to how some folk continue in business. Item. No switch of any sort or kind was provided. I know full well that the merry urchin is prone to agitate visible switches and run down our cells. But no switch at all! I can only put the light out by pulling the plug out of the

Occasional Comments.—

bayonet socket, and leaving it to dangle cheerily about my bars. Item. The cable supplied to unite cell and lamp was not split or reeved through permanent terminals at the accumulator end; and was not long enough to permit of any accident, such as a very sharp penknife may originate. Item. The bulb socket was, as usual, pushed through a hole in the lamp and secured by a lock-nut. Being a standardised part in the electric trade, it had far more threads than the thickness of the back of the lamp required. No cover was provided, so that a solid inch of naked, wirelike threads, all rather flimsily plated, stuck out as a magnet for rust. I rapidly wound insulating tape over them, thereby fixing the lock-nut, but not without disfiguring a well-made and otherwise handsome installation. About three bobs' worth of sense and material would have cut out all these obvious criticisms. Perhaps one should add that all such sets should include one spare bulb, and a tough tag specifying the sort of bulb recommended for further replacements, seeing that certain types of bulb consume about twice as much current as others of similar voltage, and these plain accumulator sets have no surplus current at the best of times.

Those Hub Gears.

I SEE that my slighting remarks anent hub gears have wounded one or two earnest owners to the quick. Perhaps my reminiscences were founded too exclusively on trials experiences. "An Old 'Un" inquires if I ever rode a hub gear. I should have retired on a competency years ago, but for hub gears; for one of the flies in my ointment is that I am often set to ride a new gadget before it is marketed, and ever since about 1905, when *The Motor Cycle* started to clamour for variable gears, I have been testing experimental gear boxes, most of the early types being "hub." I have had them so heavy that the wheel wilted; so soft that they melted; so brittle that they sheared; so full of friction that when the engine had finished turning the low gear round, it had no power left to propel the machine or me. But coming to the comparatively recent types of which our correspondents speak, I will readily admit that for light work on ordinary roads they were not half bad. I owned early editions of the two most famous types, including that which was direct on middle and geared up on top. "Solo on the Portsmouth Road" sort of going, they only wanted a little care to last a season, after which even their manufacturers stated that a factory overhaul was desirable. In a "Six Days," if used solo, they needed adjustment and lubrication daily at lunch. With sidecars in such an event they generally gave serious trouble.

North and South.

I CONTRIBUTE a parable to this discussion. Once in the South and once in the North I lived in hilly country at a considerable distance from railhead. When my engine was temporarily seized up or otherwise *hors de combat*, I would reluctantly hire a horse trap wherewith to reach the slow but reliable train. The southron gee-gee merchant, at the first sign of a declivity, reined in his nag, and proceeded down the hill at a cautious crawl, with his eyes popping from their sockets, and every muscle of his frame rigid. *Per contra*, the stalwart northerner emitted a war-howl, lashed his horse to a gallop, and took the precipice at a hand-gallop. When examined as to his tactics, he would explain:—

(1) If one has to die, die like a man.

(2) Creeping down hills is boring.

(3) Anyhow, a horse is much less likely to stumble at a gallop.

His combination of humour, sportsmanship, and common sense appeals to me.

Sponge Rubber Tyre Fillings.

THE correspondent who sighs for a tyre filled with Sorbo unburstable balls can probably obtain his heart's desire after a fashion. A Canadian and an American firm have long been manufacturing tyre fillings composed of sponge rubber sausages. You buy the stuff by the yard; chop it into lengths; pack it out circumferentially with a pair of scissor levers; run it a few hundred miles; stick in another length to take up any clearance; and then forget about it for 10,000 miles or so. It is quite largely used, especially on Ford one-tonners. I have tested it on two touring cars, but it hardly struck me as sufficiently resilient for motor cycle purposes—at any rate, not on rigid frames. It is not to my knowledge sold in a small enough section for our ordinary tyres, but I imagine that anybody who uses car-size tyres, from 80 mm. up, could probably try it on his machine. Naturally, it would take some levering into our fixed rims. It certainly procures an astounding mileage from the cover, which is continuously maintained at its correct bulge.

A Waterproof Glove at Last.

LOVERS of the pre-war continental waterproof glove will be glad to hear that arrangements are at last in train for the production of a somewhat similar article in the Midlands. I have a pair under test, which seem, so far as short wear affords any evidence, to be equal to their famous predecessors. I will publish full particulars as soon as production commences.

More About Dynamos.

THE lighting dynamo question is more complex than at first sight appears. The ideal, of course, is an installation which gives a tremendous light, and which can be trusted to keep a powerful battery well up to snuff under the worst imaginable conditions, such as arise when a man uses his machine almost exclusively after dark in winter. These data call for a biggish instrument, run off the engine or countershaft, so as to obtain the benefit of heavy charging in the free engine and low gear positions. Then weight and size and cost begin to complicate matters. Combined with the ignition apparatus, the output of a dynamo is generally limited by space considerations. Driven off a wheel by the speedometer type of transmission, the dynamo speed covers a wide range, and the instrument is inactive in free engine.

The Fourth Selection of a Series of Instructive Notes for the Beginner.

Explaining in Non-technical Language Points which may have Mystified Him.

WITH the valves, the piston rings share the duty of rendering the combustion chamber compression tight. Piston rings are made of close-grained cast iron, and their inherent springiness causes them to bear outwards upon the cylinder walls. If they bear upon the cylinder evenly all round their circumference, they form a perfectly gas-tight joint, but it occasionally happens that at one or two places a slight "flat" destroys this seal. An inspection of the rings will quickly reveal such defects: the rings will be polished in places, but stained where the burning gas has been escaping. Now and again a score in the cylinder may be responsible, but generally the fault can be attributed to the ring, which should be replaced. In fitting a new ring, see that it fits freely in its groove, but without up and down play and that it does not jam into the groove when it is compressed, as it will be when the cylinder is in position. With cylinder up-ended on the bench, place the ring in the bore in its working position, and see (in the case of a diagonally cut ring) that there is next to no gap between the ends of the ring. (About 6-1,000ths inch is the gap generally allowed.) Many riders polish a new ring into the cylinder by placing it on the piston, and, using a piece of wood for a dummy connecting rod, work the piston up and down the cylinder bore, in which a small quantity of paste metal polish (*not* grinding compound) has been previously smeared. As the work proceeds, "flats" on the new piston ring can be traced, and the lapping-in continued until the ring is bright all the way round. This, however, is a tedious process.

POINTS ABOUT PISTON RINGS.

ONE term in particular which appears to be much misunderstood concerns the compressed ratio of an engine. Because he can rest his weight upon the kick-starter crank, one occasionally hears a novice remark that the engine has "high" compression. All that it really signifies, however, is that the engine has no leakage around valves or rings—in other words, "good" compression. The compression ratio, upon which "high" or "low" compression depends, has reference to the degree to which the charge of gas is compressed before it is fired. The higher the compression, the more powerful will be the resultant explosion, but the more prone will be the engine to knock. An average touring engine has a compression ratio of about 4½ to 1; a sports engine may have a ratio of 5½ to 1 or even slightly more. The use of alcohol fuel, which has been referred to in *The Motor Cycle* recently, permits of the compression ratio being increased without the pre-ignition which would be inevitable with petrol.

"HIGH" VERSUS "GOOD" COMPRESSION.

TO return to the question of improving petrol consumption, however; assuming the compression of the engine is good and the ignition sufficiently advanced, it is possible that wastage of petrol may be caused (*a*) by flooding of the carburetter, (*b*) by the use of too big a jet, and (*c*) by leakage at one or more of the unions. There should be no trace of wetness below the jet chamber when the machine is stationary; if there is, it is (1) because the level of the petrol in the jet is set too high, or (2) because the needle valve is defective. With many types of modern carburetter it is impossible to discover the exact level of the petrol in the jet, which should be just not running over, and more frequently the cause of flooding lies in a particle of grit having lodged on the seating.

CARBURETTER ADJUSTMENT.

THE weight of the float is taken into consideration by the makers of the carburetter when they set the cut-off of the needle valve. Any extra weight which the float may afterwards acquire, therefore, will cause the float to sink below its pre-determined level, and so fail to cut off the petrol supply at the proper time. The float will obviously become heavier if it should spring a leak, which will permit even a minute quantity of petrol to enter it. If this has happened it is much easier to buy a new float than to attempt a repair.

PUNCTURED FLOAT.

THE novice who has been doing a round of Olympia may have heard a term which is greatly to the fore of late—that is, "turbulence," and it signifies the whirling of the charge of unexploded gas after it is drawn into the cylinder. Even the best of carburetters does not transform the liquid petrol into a perfect gas, but delivers a mixture of atomised petrol and air which is "streaky," in that the petrol does not permeate the air, but hangs about in patches. To cause turbulence, the interior of the cylinder head is so shaped that the piston, as it draws the gas into the cylinder, causes a swirl which gives the "mixture" a chance to mix, with a repetition of the process on the compression stroke. Before this effect was imparted by cylinder head design, various types of mixing fans used to be fitted in the induction pipe, in the hope that the passage of the gas would cause these fans to revolve, but their chief practical effect was to block the inlet pipe.

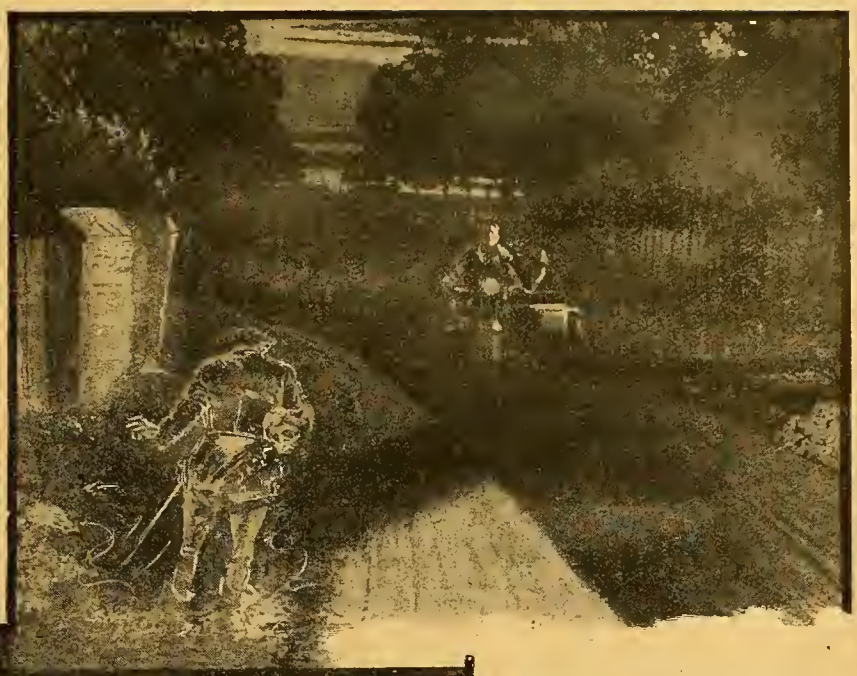
TURBULENCE.

"HINTS AND TIPS FOR MOTOR CYCLISTS"—gives hundreds of useful "wrinkles." Price 2s. 3d. post free from "The Motor Cycle" Offices, Dorset House, Tudor Street, London, E.C.4.

TALES THAT ARE TOLD.

Phantoms of the Road of which we hear over the Nuts and Wine at Christmas time.

OF A GHOST IN ST. LEONARDS FOREST AND A COUNTERPART IN WARWICKSHIRE. A tale is told of a certain Captain Powlett, whose spirit is said to wander about St. Leonards Forest with his head under his arm. Why, history does not tell us, for Captain (or Squire) Powlett was not beheaded and died naturally in 1746. In Warwickshire, somewhere near the old Roman Fosseway, there is a coppice and a barn between which another headless nomad of the spirit world is said to run on certain nights of the year.



IN ENGLAND AND WALES—AND PERHAPS IN SCOTLAND TOO—there are tales of a ghostly coach and four which silently passes along a highway where sped the flying coaches of 1785. The Great North Road has its phantom coach, as has the Old Colwyn Road in Wales. Perhaps during the festive season the hard-headed Scot, too, will admit to seeing one somewhere near auld Reekie. It is strange, however, that tales are told only of the —more or less—picturesque. One never hears of a ghostly gardener and his phantom wheelbarrow, nor of a shepherd and his sheep. There is, however, a tradition, emanating from somewhere in the Yorkshire Wolds, of a jangling tinker's cart dragging behind it all that is left of the driver

OF HIGHWAYMEN BOLD—AND OTHERWISE. Dick Turpin, so the story goes, still haunts the scenes of his misdeeds. Tradition says that his spirit is partial to a side lane on the Knutsford-Warrington road, yet we rarely hear of him on Putney Heath or near the Spaniards at Hampstead. Other highwaymen have left a ghost or two, and one of their victims, a sailor, is said to appear on Hindhead whenever the sky is cloud wracked and a watery moon is sailing.

* * *

A POPULAR FALLACY—that the camera cannot lie.

WHO'S WHO IN THE MOTOR CYCLE WORLD.

The Third of a Series of Biographies.

This feature is to satisfy the general reader as to who and what manner of men they are of whom he reads in "The Motor Cycle" week by week.

Hugh Gibson, Sales Manager, Liverpool.—Hugh Gibson, who was born at Southport, and is 43 years of age, set up long distance sidecar records in 1910 and 1911 which stand to this day. In the former year he drove a single-geared 489 c.c. Triumph sidecar over the "End-to-End" route in 40h. 47min., and followed it up in 1911 with a time of 38h. 47min. on a two-speed 554 c.c. Bradbury. He also created in the same year an Irish end-to-end sidecar record of 394 miles in 14h. 7mins., the Bradbury again being used. In 1914 he carried out a test of 2,000 miles in 200 hours under A.C.U. observation on a Clyno sidecar at a running cost of ½d. per mile. Won the N.W. Centre Motor Cycle Championship in 1921, and in 1922 a special prize and gold medal in the International Six Days Trials to Switzerland, riding a 348 c.c. Raleigh. Present mount: 348 c.c. Raleigh. Favourite type of machine: Single-cylinder sports lightweight. Hobbies: Music, tennis, shooting.

Thomas Silver, Works Manager, Birmingham.—Tom Silver is 59 years of age and a Londoner. He was a pioneer of the motor cycle, both in this country and abroad. In 22 years he has won 189 awards. Silver took part in the 1902 Motor Cycling Club's non-stop run, but was disqualified for exceeding the speed limit The following year he was the only man to get through in the Glasgow to London event. The speed limit was then 12 m.p.h., and the test consisted of two non-stop runs—Glasgow to Leeds and Leeds to London. In the 1903 Land's End to John O'Groats Trial he was 64 hours on the road, and won one of the only three gold medals. He represented England in the International Motor Race in France, and in 1903 took a machine across Africa—6,000 miles in all. An attempt to ride a motor cycle from Cape Town to Cairo failed. Present mount: 490 c.c. Quadrant. Hobby: Motoring.

Jack Emerson, Experimental Engineer, Walton-on-Thames. — J. L. Emerson, born at Walthamstow 31 years ago, is a successful speed man who has devoted particular attention to the attainment of power with endurance and has scored his best successes over long distances. In the Brooklands T.T. of 1912 he steered the 490 c.c. Norton to victory, and in 1914 with a 496 c.c. A.B.C. secured the kilometre record with a speed which worked out to 80 m.p.h. That occasion is notable as being the first application of the streamline tail to a motor cycle. Since the war he has brought off the "hat trick" in the Brooklands T.T. races by wins in 1920, 1921, and 1922. In the two former years he twice broke the hour record, and this year once. The machines used were: In 1920 398 c.c. A.B.C., and in the two latter years the 494 c.c. Douglas. Present mount: 494 c.c. Douglas. Hobby: Scientific research.

William Barr Gibb, Motor Cycle Agent, Gloucester.—Billy Gibb, a Scot and 44 years of age, was a successful racing cyclist before he took up motor cycling. He has done very little competition work recently, owing to business claims, but over a long period he was one of the most successful of riders in the West country. In 1913, for instance, he won seven cups and twenty gold medals, all on Douglas machines. Other awards gained have been Anglo-Dutch Motor Cycle Cup, Dutch Plaque and gold medal, Colmore Cup, Terry Cup, and Haslam Cup (English Six Days Trials), Birmingham Motor Cycle and Auto Cycle Trophy, Calthorpe 100 Guineas Trophy, and Ilkley Trophy. Present machines: 494 c.c. and 348 c.c. o.h.v. Douglas. Favourite type: Flat twin. Has no time for hobbies outside motor cycling.

Frank Warren Giles, Competitions Manager, Wolverhampton.—Frank Giles, who is 32 years of age, was born at Kidderminster. Has had a remarkable run of competition success with A.J.S. sidecars. Among his principal achievements are the following: Single-gear award in Colmore Cup, 1913; B.S.A. and Castle cups in the West Midland Open Trial, 1920; London to Land's End (Captain's Cup), 1921; Birmingham to Land's End (Sangster Cup), 1921; Ilkley Open Trial, 1921 (Ilkley Trophy); Wolverhampton M.C.C. Trials, 1920 and 1921 (Corke Cup); Kidderminster M.C.C. Trial, 1921 (Castle Cup); M.C. and A.C. Birmingham-Holyhead-Birmingham 24 Hours Trial, 1922 (M.C. and A.C. Trophy and Jordison Trophy); Reliability Premiership, 1922, Leicester and District M.C.C.; Paskell Cup Trial, 1921 (Paskell Cup and Reader Cup). He was the first sidecarist to climb the Screw Hill in Wales. Present mount: 799 c.c. A.J.S. sidecar. Favourite type of machine: Twin-cylinder heavy sidecar. Hobby: Motor cycling.

James Robert Alexander, Motor Agent, Edinburgh.—Jimmie Alexander was born at Edinburgh 47 years ago. In his young days he was an ardent cyclist and held the Scottish champion and many records at various distances from 1895 to 1900. In the early days of the present century he turned over to the motor cycle, and again was consistently successful in competitions. He has had several wins in the Scottish speed championships. Present mounts: 348 c.c. Douglas, 494 c.c. Douglas, and 249 c.c. New Imperial. Favourite type of machine: "No particular preference. Use all types and powers, both solo and sidecar." Hobbies: "Too many to enumerate."

The Rev. John Maxwell Philpott, Vicar of Stockingford, Nuneaton.—J. M. Philpott, who was born at Churchstoke, Montgomeryshire 35 years ago, claims to be the heaviest competition rider of a lightweight, as he rides at just over 15 stone. Is local consul of the A.C.U., chaplain of the Coventry and Warwickshire Motor Club, vice-president of the Nuneaton and District Motor Cycle Club, and is on the Board of the Midland Centre A.C.U. Professes "a greater dislike of sidecars than any other motorist in England"! Best performances in competitions were his gold medals in this year's Scottish and English Six Days Trials. Another outstanding achievement was his climb of Applecross and Tornapress on a 220 c.c. machine. Present mount: 249 c.c. Velocette. Favourite type of machine: 250 c.c. solo. Hobbies: Lawn tennis, chess, and "riding a motor cycle where no one else has done so."

THE LAST STRAW—

A Story Without Words of the Compleat Motor Cyclist.

ECCOTT

MOTOR CYCLES for NOTHING

The Will and the Way; or, How to Acquire Motor Cycles by Hook or Crook.

Illustrated by O. Cuningham.

By CLAUD D'AGINCOURT-JONES.

DEREK Mullins laid down the Show Report issue of the "Blue 'un" with a sigh.

"We'd better cancel this paper at the newsagents, you fellows!" he opined, with a sigh; "I'm sick and tired of reading about the finest sport in the world with no prospect of ever being able to afford it. Let's chuck it and resign ourselves to ping-pong."

The two men who shared his diggings put down their books and stared at him despondently.

"Mervyn's suggestion last week wasn't half bad," remarked Jim Elyard. "We all give up gaspers and little drinks, and save like blazes. In a year, with luck and prices going on dropping, we might raise enough of the ready to buy a fifth-hand outfit. One on the saddle. One on the carrier. One in the sidecar. Take turns at driving, of course. Better than nothing."

"Rot, Jim!" was Mullins' ungracious reply. "We all know old Mervyn's got a chin like a doorstep, and can live like a hermit when he wants to. You and I can't. Our average salary is round about £4 a week. These digs. run us in for two-thirds of all we earn. Then there's clothes and things. Can't be did. Besides, one of us is sure to shift his berth soon, and then we'd have to sell the 'bus anyhow. And what about our girls? How long should we keep them if we did bachelor stunts together every week-end. Think again, old chap."

An Idea.

Came a quiet voice from Mervyn in the corner.

"I've been thinking. . . ."

Derisive chorus from the other two.

Mervyn laid down "Sherlock Holmes' Last Bow," and expostulated.

"No, honest, you fellows. There's pounds and pounds about an inch from the tips of my fingers, and I really believe that if we put our heads together we can grab some of it."

The chums greeted Mervyn's brain-wave with derogatory suggestions. Backing winners by faked telegrams, they supposed? Marrying heiresses? Falsifying the cash books?

Mervyn let them exhaust their witticisms, and proceeded.

"I stepped into the Blank Motor Company's place on my way home—saw a 1923 twin Zenith that was worth looking at. Inside the office old Blank had about forty typed police slips pinned up, all warning him to look out for stolen motor cycles. I got home ahead of you chaps, and snatched the first read of our 'Blue 'Un.' I see that insurance societies think nothing of offering a tenner reward for tracking a stolen 'bus. Nobody seems to go after these pinched machines with any push and go. They just notify the police. The police notify the garages. The garage never bothers to verify a chap's frame and engine numbers when he stops for petrol. Seems to me that three lads who meant business might rake in a lot of these tenners, don't you think?"

Various Plans.

"Yes, and I've got the trick of it," almost shrieked Mullins. "We rig ourselves up as bobbies, and play the 'examine your licence' stunt somewhere every Saturday and Sunday. Jim squints at their papers while old Mervyn there cocks his eye over the machines and spots the crook stuff. I'm the Dempsey of the gang, and secure the criminal if he turns nasty. Then we collect from the insurance blokes."

Elyard, always matter-of-fact, torpedoed this notion. "And the sergeant arrives on his rounds before the first 'pinched' 'bus appears. So we all do time for impersonating police officers!"

"Well, that's not the only way," said Mullins, not a whit abashed. "How's this? We all three get jobs as petrol boys on one of the big roads out of town. Space ourselves out over 50 miles. Study those cop papers that Mervyn was yarning about. Cast our eagle eyes over every bike we have to serve. In say six months we ought to nab, say, fifty out of the hundreds that get pinched?"

"Stow it," growled Mervyn. "I've pretty well worked it out. Some of the little makes get stolen sometimes. Two of the papers at Blanks were about a 211 c.c. Creeper and a 249 c.c. Tripper. Now if

Motor Cycles for Nothing.—

I know anything about it, there aren't more than fifty of either ever been turned out. We approach the makers, get the frame and engine numbers of all the 'buses they have ever delivered, and advertise that we'll give a high price—say £5 under list—for a second-hand sample. The thief 'ull jump at the chance of such good money. We nab him—and we nab all the other machines which he has nefariously collected."

"Dud, old chap," answered the relentless Elyard. "Dudder than dud. It's the petty little once-in-your-life sneak thieves who pinch Creepers and Trippers. Your wholesale merchant won't look at anything that isn't both good and common. He'll specialise on something like Triumphs or Sunbeams of one model; change the numbers; camouflage them with new paint and different accessories; and pass as an honest trader. Your stunt is a wash-out."

Concentration.

"I believe you're right about wholesale thieving," mused Mervyn abstractedly; "but it don't follow that my stunt is a wash-out. Suppose we concentrate on a first-class 'bus that's been delivered by thousands like the 550 c.c. Triumph. With a few calls or letters we'd get to know how many have been stolen say in the last three months, what their numbers are, what genuine series numbers exist, and so forth. Then we bustle round and advertise extra good money for Triumphs. We ought to get into touch with a gang somewhere. I expect they pass these pinched 'buses through a lot of hands to cover their tracks, especially with the second-hand market as dead as it's been lately. They'll jump at a fair price."

This plan brought the three heads very close together. The 480 c.c. Peterson was substituted for the Triumph, as Mervyn had a pal in the Peterson works, and fancied he could rapidly obtain a lot of inside information. For the next day or two the three typed heavily on some specially printed memo. forms of rather "posh" character whenever their business superiors were out of range. Their bill for postage stamps was alarming; and when they left their respective firms' offices on official business, kindly but costly taxis enabled them to visit sundry insurance offices without arousing suspicion about the length of their absences.

A week later quite a pile of information had been correlated and memorised. The 480 c.c. Peterson, as everybody knows, is a high-class machine, of which probably some 18,000 have been made, and is always in steady demand even down to seventh or eight hand. Listed at £110 during 1922, its second-hand price in these slumpish days is certainly not over £75, unless the buyer be what salesmen call "easy fruit." So the following advertisement was calculated to stir the pulse of any anxious super-thief, who had two or three dozen Petersons leaking out from a back street workshop on to the market by devious routes at a net return of perhaps £45 apiece to the principal criminal.

The trap was baited as follows:—

> BRING your 1922 Peterson to us. We know you meant to keep it for 1923. In a year it won't be worth more than £50. We offer you £78/10 cash down in notes on inspection. We can do this because we need 100 immediately to fill an export contract. We will accept your order for any 1923 model. Easy payments if desired.—Salmons and Simpson, Commission Agents, 992, Wool St., E.C.

The Thursday on which this advertisement was published saw Derek Mullins commence his annual three weeks' holiday at an unwonted season of the year which considerably amazed his boss. It also saw him installed in a temporarily rented office at 992, Wool Street, complete with stenographer, typewriter and other accessories complete. The stenographer had nearly wrecked the entire business, for she was Elyard's best girl at the moment, and Elyard hardly fancied allowing his *inamorata* to spend possibly three whole weeks *tête-à-tête* with such a famous breaker of feminine hearts as Derek. But the funds did not run to paying wages; and Ella was a sport, and had some leave to draw from her office. So Elyard consented with rather a dubious heart.

"He was called many hard names."

Motor Cycles for Nothing.—

Derek had various lethal weapons in a drawer ready to hand. He and Ella were more than punctual at business for the first time for years; and it was with slightly quickened pulses that they faced a day which might mean death, riches, or nothing at all. For some hours it was nothing that happened. They postponed lunch till 3 p.m. on the chance of some motorcyclist in a subordinate position arriving during the dinner hour. It was not till Ella had sought the nearest Lyon's shop just after 3 p.m. that the first caller blew in. This young giant in a Trinity Hall scarf looked as if he was the spearhead of the Cambridge rugger scrum, and breezily remarked that having put his shirt on a loser he'd got to sell his bike to face settling day. He didn't know the number, but as Derek's well-drilled memory instantly informed him on inspection at the kerb outside, the machine was honest enough. It was hereabouts that Derek realised what he was up against. The three pals, by selling all their portable property and borrowing every half-crown to be smelt among their acquaintance, had raised enough to pay for *one* 480 c.c. Peterson. Of that solitary intended purchase more anon; in the meantime this cheerful Hercules had to be gently pushed off somewhere else; and when a man is expecting £78 10s. for what is barely worth £75, he takes some pushing off. However, Derek sized up the giant as not being too technical to be nice. He bent over the bicycle, feeling and rattling and sniffing. "H'm. Chains three thous. out of pitch. Lot of big end slack. Cylinder bit oval. H'm. H'm."

At last he straightened himself.

Temporary Relief.

"Very sorry, sir. Your machine isn't at all in the sort of condition my contracts demand. If you really want cash for it to-day, better try a firm who specialise in overhauling before resale. Say, ——, of Portland Street."

The giant departed rather sadly, with incoherent mutterings about his perhaps having forgotten to oil the dashed thing when he rode home blotteau after such and such a match. He left Derek foreseeing trouble.

By six o'clock Derek had interviewed a number of traders anxious to sell him 100 Petersons, even—if need be—at much less than he offered. He played them off against each other, and held out hopes of an immediate deal if the said machines could be arrayed for "his engineer" to inspect them. He got rid of various callers who had fancied that Rudges or Sunbeams or Triumphs would do as well as Petersons; of a clerk who regarded a Baby Levis and a 480 c.c. Peterson as interchangeable terms; and of a varied assortment of touts of one sort or another. In between-whiles he disposed of several honest private owners who had not been able to eat any lunch under the exciting prospect of getting £78 10s. for their roadworn Petersons, and who, having killed grandmothers or invested wives with inflamed appendices, had got leave off business to fetch their bikes up to town for Salmons and Simpson to purchase. He was called many hard names, invented some atrociously false diagnoses of perfectly sound machines, and, before evening, began to feel something of a brute.

A B te?

Next morning Derek and Ella were horrified to find a regular Mount Everest of letters heaped on the floor inside the letter-slit, and callers kept them more than busy. More lies. More insults. More stormy interviews with fierce private owners, who were not only disappointed financially, but also wounded in their tenderest spots by accusations of under-lubrication and the like. But at 2.30 p.m. a veritable mouse took the cheese. A young, decent-looking, well-dressed stranger appeared to offer his bike for sale, and on inspection its frame and engine bore numbers which had never been reached in the Peterson series. Derek counted out £78 10s. from the £81 in notes which represented the gross capital and credit of Salmons and Simpson, and allowed the capable, smooth-spoken young man to depart with the cash, whilst he, Derek, rode the obviously stolen machine round to a garage previously selected as the firm's official storage.

Strategy.

Had he gone mad? Not at all. Heroic as the stratagem was, the united brains of our aspiring trio had finally reasoned thusly: The thieves will certainly try us. They will send a test machine. It will cover up its tracks so well we could never trace them by it. The bringer will have a lovely alibi all cut and dried. If we seem green and ask no awkward questions, they will plant their whole stock on us within the next three days.

So Derek, not without a thumping heart, reduced his

"So it's you, Darkie, is it?" said the detective genially.

Motor Cycles for Nothing.—

firm to a state of complete insolvency, stored his solitary purchase, which represented a dead loss of perhaps £8 10s. on a forced resale, and returned to the office to see that his lethal weapons were handy and in working order. The rush of aggrieved clerklets, eager to secure top of the market price for machines they had tired of, had subsided by this time. The day's bulky correspondence had been disposed of, and the time was passed in a somewhat heated argument with Ella. There were two outstanding difficulties to be solved. Should they ring up Elyard and Mervyn, add them to the staff for to-morrow at the risk of dismissal from their present posts, and utilise them as amateur trackers of any suspicious bicycles brought to Messrs. Salmons and Simpson during the next day or two? This was Ella's brainwave.

Not According to Plan.

Derek for his part rather mistrusted amateur tracking, and having got the wind up, conceived ideas of ringing up Scotland Yard, and imploring the Big Four to place a cordon round his offices and rope in such trustful criminals as might rally to help themselves to his suppositious notes next morning. The argument waxed hot and strong when the door was suddenly opened without any premonitory knock. In walked three burly, alert-looking individuals, who without any more ado marched Derek and Ella off to the cells, leaving one of their number in possession.

The feelings which occupied the managing director and his charming stenographer during the evening can be better imagined than described. The proprietor of their garage was quite a punctilious person on the subject of stolen bicycles, and instead of being thief-catchers they now ranked as caught thieves. Meanwhile the junior partners were not wholly free from anxiety. The hours passed. Derek was missing. Ella was missing. £81 was missing. A visit to Wool Street produced nothing but locked doors. Nourished on Sherlock Holmes, Mervyn at least was well aware that only professional detectives jump to the obvious conclusion with confidence. But even he finally admitted that things looked uncommonly black.

Towards 9 p.m. a detective illumined the situation, but by no means relieved their anxiety. He wasn't one of the Big Four, as they both supposed, but he was quite a sensible fellow. When their nervous, bubbling explanations at last convinced him, he sat down and roared with laughter for full five minutes by the clock. And at last two very crestfallen junior partners walked round to the police station in company with a plain clothes man who stopped every few yards to hold his sides and let fly an extremely unprofessional cachinnation.

Explanations.

The staff of the firm then held an interview with the big noise at the station. It commenced by being extremely humiliating, but ended in quite promising fashion. Next morning saw the managing director re-installed at his desk. At a smaller desk to his left sat the pretty stenographer as before. Both of them wrestled—quite brightly, too—with the morning's correspondence. To all outward appearance the office was unchanged. It is true that the drawer near Derek's right hand no longer housed its former lethal armoury. Indeed, that armoury had suggested some rather awkward questions about gun licences. It is also true that the little room up the passage was no longer empty. Inspector Jenkins was seated there—in plain clothes, it is true, and armed with nothing but the *Winning Post*; but quite alive to anything that might happen. His presence was partially answerable for the increased *joie de vivre* of the staff, as compared with the previous morning. Only partially. For some of the inspector's best henchmen were variously disposed among the busy crowd in the street below; and one of them was taking an unconscionable time to swallow a cup of coffee near the front window of a first floor tea-shop opposite.

In the Net.

Derek not undeservedly spent several rather trying quarters of an hour with sundry honest, earnest, covetous and irritable motor cyclists, who greeted him warmly on arrival, but made unprintable remarks about Messrs. Salmons and Simpson before taking their reluctant departures. It was, however, written in the stars that 11.13 a.m. by Big Ben was to be Derek's lucky hour. For it was precisely at that moment that a youngster of some 28 summers, with whom to all appearance the Old Lady of Threadneedle Street might have trusted the National Debt, knocked smartly at the door and walked in. It was at 11.13.28 a.m. Greenwich mean time that Inspector Jenkins put down the *Winning Post* and followed hard on the heels of the aforesaid unimpeachable young man into Derek's office.

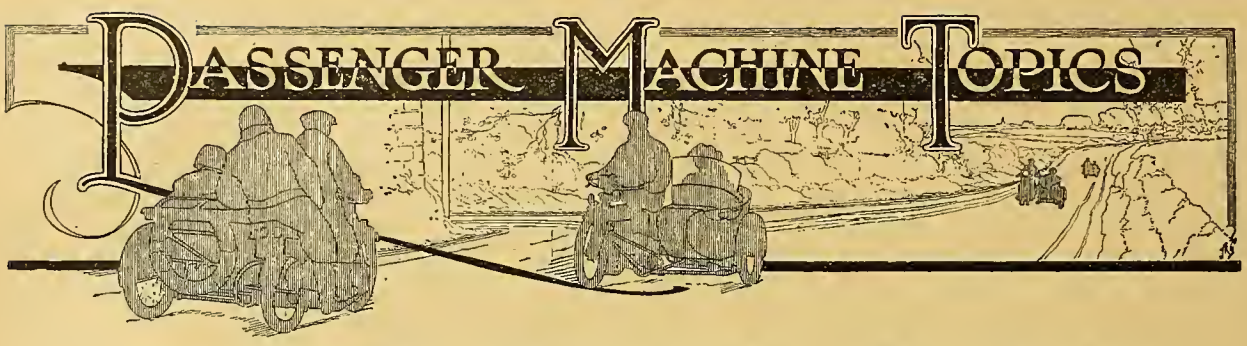
"So it's you, Darkie, is it?" he said genially. "We'd been wondering what you were up to. Now are you going to tell us where all the other machines are? Or would you rather be gagged and sit in the next room with me while my men downstairs shadow the rest of your crowd back to your private garages? Have you seen the *Winning Post* this week? I can tell you one or two of the best while you're waiting, if you like."

"Darkie" had quite a lot to say. His vocabulary was what you might call fruity in parts. But when his r.p.m. died down a little, he decided to tell. Meanwhile Derek cheerily disposed of several more quite honest Peterson owners.

Subsequent research on the part of Inspector Jenkins and his stalwart men proved that "Darkie" had specialised in several leading makes besides Petersons.

The Happy Ending.

The insurance companies behaved like gentlemen. Derek, Mervyn and Elyard have all taken deliveries of extremely attractive motor cycles. In fact, the profits ran to supplying Ella with an open-frame two-stroke. And what is in the bank suggests that the monthly garage bills can be met. That they will be met punctually is another matter—we all know what youthful motor cyclists are.



Jumping to Conclusions: Sidecar Outfits and Family Loads: Sidecar Racing.

By "FRIAR JOHN."

IN some natures the lure of the road is like the strangely persistent call of the sea, luring at all times and at all ages. And, whether the roads be old or new, they still exercise their spell in their own particular way. This passion for the road is not inherent in all natures, however, for I met a man recently who appeared not to care for the wide spaces and great highways, nor for the secluded by-ways for that matter. Yet he was an ardent motor cyclist, for he bought one of my sidecar outfits on a cold night when the rain was beating down on the galvanised roof of the garage. I apologised for the mud that was plastered about the wheels, and the oil that should not have disgraced the engine. But, to my amazement, he said he didn't mind that. In fact, he seemed rather to rejoice that the machine was dirty. "I like cleaning motor cycles," he said. "You see this machine on Sunday; you'll not know it; I'd jolly well rather be cleaning and tinkering the 'bus than riding it."

◈ ◈ ◈ ◈

I WAS too astonished to reply instantly, and wondered if his tongue was in his cheek. But he was quite serious. Strangely enough, I did see the machine, resplendent in its glittering nickel and polished enamel, on the following Sunday morning. It was a day, too, that one remembers—sandwiched between days of wind, cold drizzle, and fog, such a one that we fondly imagine to be the rule in the land of the mimosa. Motor cyclists on this morning left the town like bees from a hive on a a spring day, and the pulse throbbed at the exhilaration of speeding for miles over tolerable roads with a perfect blue sky above.

◈ ◈ ◈ ◈

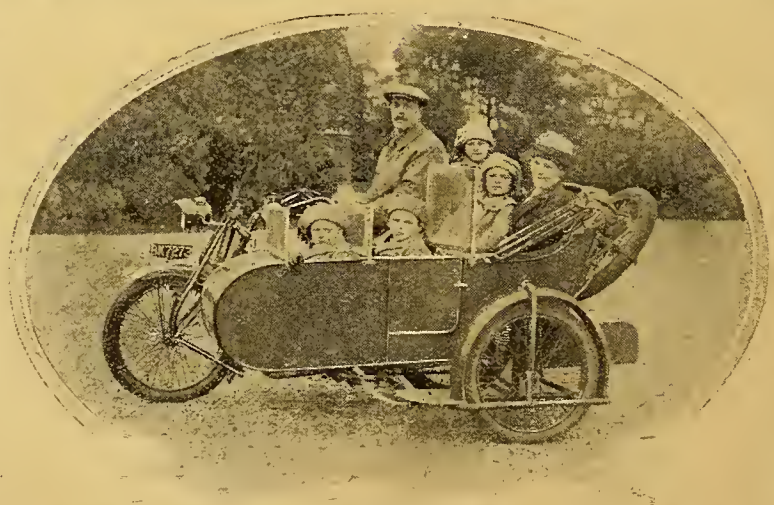
THE "Blue Cow" is a snuggery enticingly situated, enticingly comfortable and about four miles from the town, and it was on passing this place, passing it, mind you, I saw my former outfit with its sidecar wheel dropped four or five inches in a damaged drain cover. (Note the detailed observation.)

My friend and I rode on, and after making a circuit of about fifty miles stopped at the "Blue Cow" on our way to a late lunch. There we saw the outfit in exactly the same position, with the wheel in the drain cover. Although this did not prove the man's candid assertion that he liked tinkering, and cleaning as much as riding, it certainly appeared to show that he preferred to sit in the foul atmosphere of a bar in preference to filling his lungs with fresh air.

We almost hesitated to enter the inn, for there could be no pleasure in conversing with such a man. However, we did go in, very conscious, too, of our interest in, and condemnation of, the man.

◈ ◈ ◈ ◈

AT the bar we found a stranger, leather clad and quaffing beer. He had been quaffing beer "for *two hours or so*," he said, whilst a Johnny in the back yard put his 'bus right. Some "infernal, beastly thing" had gone wrong with the gear box, and this obliging Johnny had taken it down, had run over to the town and got a replacement, and was now busy reassembling 'midst the "ducks and cows, don't you know." We glanced through the window and saw, as we expected, that the "awfully obliging Johnny" was our friend who liked cleaning motor cycles, and whom we had condemned so ruthlessly for preferring to loaf in a bar instead of being on the road.

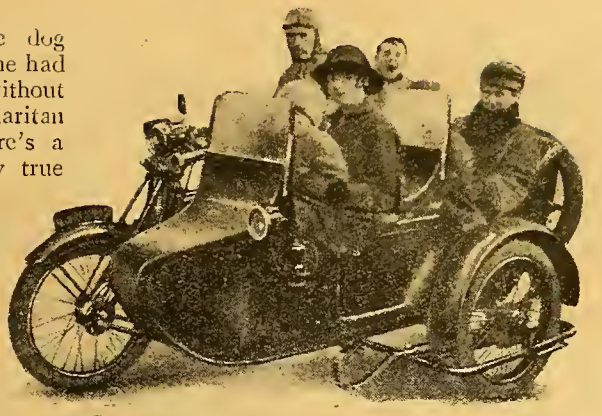


In order to accommodate four passengers Mr. W. Weaver, of Southsea, has lengthened his sidecar.

Very few men would have helped

Passenger Machine Topics.—

this rather self-satisfied lame dog over the stile as completely as he had been helped. We departed without congratulating the Good Samaritan on his superb altruism. There's a barbed moral in this perfectly true story.



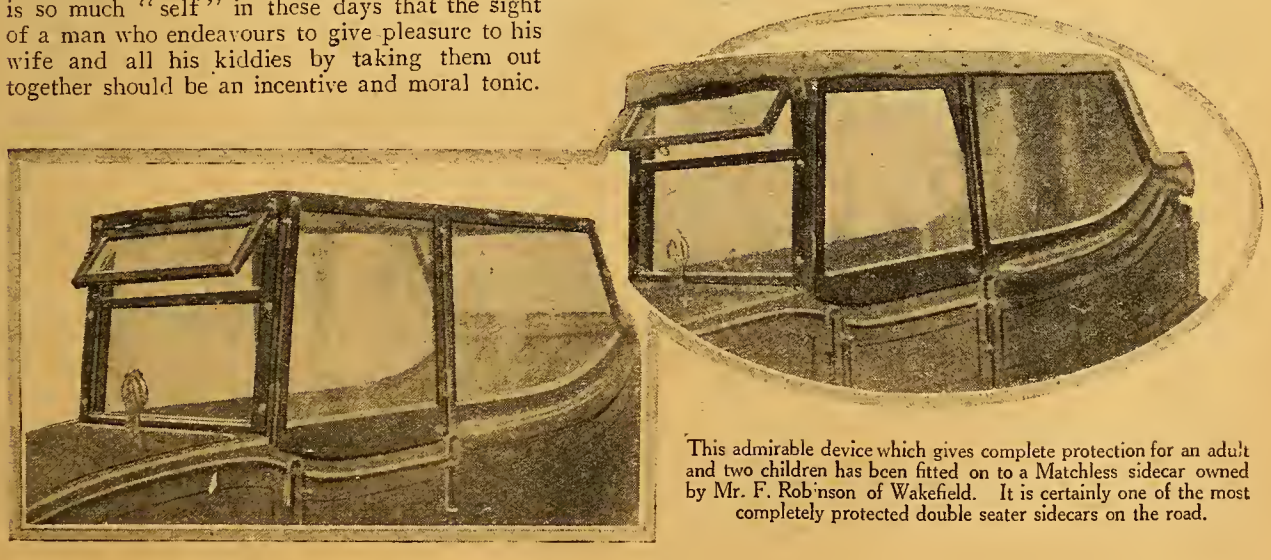
Mr. J. E. Sykes, of Scarboro', and his loaded A.J.S. outfit. In spite of the weight carried the machine does its work admirably.

ARE young club members the most enthusiastic of all motor cyclists? I know youngsters who would have slept with their first real fast machine—that is, for the first week—if they had been allowed. But these would-be T.T. winners soon simmer down to "average owners" who have to be gingered occasionally by an energetic secretary. No! commend me the family man who has to scratch a thinning thatch as, year by year, the problem of accommodation becomes more acute. He is the enthusiast, the man who maintains his interest, and one of the mainstays of the movement; curiously enough, in many instances that have come under my notice he could have afforded a small four-seater had he so been disposed.

WHO but the keenest of sidecarists would have gone to the trouble of lengthening a double-seater sidecar as Mr. Weaver did, in order to accommodate four children? (see illustration). Critics may bark as much as they like about overloading, and disagree with the taking out of the entire family together. But I staunchly uphold the practice when it can be done in safety, and that it can be done in safety is obvious. The speed "knut" may be contemptuous when he meets the loaded "chars-a-banc," as he calls them. But whenever I hear serious criticism of the man who pilots these big family loads I jump as hard as I can on the said critic. I know who is the more unselfish man of the two. And there is so much "self" in these days that the sight of a man who endeavours to give pleasure to his wife and all his kiddies by taking them out together should be an incentive and moral tonic.

THERE has been a good deal of discussion amongst the leading racing sidecar men as to whether a flexible chassis would be an aid to cornering on a course like the T.T., for on the dirt tracks of America it is universally used, since it enables the unbanked circular courses to be taken without lifting of the sidecar wheel, and some terrific speeds are attained. This type of chassis has not been exploited here, simply because there has been little more than an occasional need for a sidecar to take a bad bend at speed, either in trials or speed events. But a sidecar T.T. is a different matter. Stability of the outfit on corners will easily be the most important factor in the race; it is quite on the books that the flexible chassis will be seen on the island—if the regulation of the race permits.

ALL who say there will be no more danger in riding a sidecar in the T.T. than there is in riding a solo machine have their reasons, no doubt, but I am quite confident that the utmost discretion and finest judgment will be imperative when rounding a curve at speed if overturning is to be avoided, no matter what type of chassis is used. The acute hairpin bends and blind corners will, of necessity, reduce the speed automatically; the real undoing of many riders, I think, will be the deceptive curves which look as though they may be taken at a much greater speed than they can be with safety. However, the great majority of expert racing sidecarists are confident that there will be no particular danger in the race, and one only hopes that the contest will prove my misgivings to have been entirely groundless. The probable contestants are boisterously fearless.



This admirable device which gives complete protection for an adult and two children has been fitted on to a Matchless sidecar owned by Mr. F. Robinson of Wakefield. It is certainly one of the most completely protected double seater sidecars on the road.

LETTERS to the EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

Correspondence should be addressed to the Editor, "The Motor Cycle," Dorset House, Tudor Street, E.C.4, and must be accompanied by the writer's name and address.

T.T. SPEEDS ON THE ROAD.

Sir,—May I suggest to some of your correspondents that Brooklands is a very suitable place for record breaking.

It is rather a pity "Zenooth" could not keep quiet, as, I am sure, some of these persons are only trying to see if his speeds really are attainable.

Without wishing them any harm, may I also say that if they do manage to break anything, may it be nothing more serious than records. SLOW BUT SURE.

Worksop.

SUN-BLIND GOGGLES WANTED.

Sir,—Can any of your readers tell me where I can purchase a pair of goggles fitted with what I will call a "sun blind," this blind or shade to be hinged, so that when travelling east in the early morning, or west in the evening, it can be lowered to save the sun blinding one? Something after the style of an ordinary shop blind would be of great help to those who wear helmets.

A. C. HARRINGTON.

BENEFITS OF RESEARCH WORK.

Sir,—I was pleased to see the letter from Mr. H. S. Rowell, calling attention to the benefits of research work and to your remark that the brake mentioned was the first practical evidence of the activities of the Research Association.

Although, as you mention, this may be the first notification of any device to reach you, may I point out that the very nature of the work calls for a certain amount of secrecy, and is not such as would interest the motoring public generally, or directly. It has, however, benefited, and will continue to benefit, them through the members of the association, who are at liberty to, and do in confidence repeatedly, bring their problems and difficulties to be solved. Progress in research work throughout the world is carefully watched by the Research Staff, and reports of interest forwarded to members. The various problems connected with motor cycle design are continually undergoing investigation, and data with special reports, suggestions, etc., from time to time circulated, the results being seen in the more perfect machines members offer to the public. The work goes on quietly and unseen in the background, little being heard of it except by directly interested parties (the members of the Research Association of the British Cycle and Motor Cycle Manufacturers), but it is none the less valuable because it lacks the limelight of publicity. JAS. L. NORTON.

INCOMPETENT ATTENDANTS AT THE SHOW.

Sir,—May I use your columns to point out to manufacturers the great mistake of employing incompetent showmen at Olympia. You quote several instances in *The Motor Cycle*, and I have heard of several more cases and experienced it myself.

To one who is contemplating buying his first machine, an incompetent salesman is unconvincing, and breeds suspicion of the machine he represents, whilst to an old hand, or to one who rides the firm's machine, he is no less than an insult to the intelligence.

Two firms at least, and there must have been many more, had real experts in attendance, men who have forgotten more than most ordinary motor cyclists know, and they, of course, were equal to any demands put upon them.

It really is annoying to go to the stand of the makers of your machine to make an inquiry, and find that the representative not only knows less than you do about it, but also assumes that you know nothing and that any tale will do to keep you quiet.

May I suggest that firms should make a point of having a really competent *engineer* on the stand who will be able to give real information to those who seek it. If they cannot spare one of their own men, surely they could get some good exponent of their machines for the week, preferably one who performs on the track.

The contrast between stand and stand at the show was very marked in this respect, and there was a considerable amount of irritation produced by inefficiency on the part of some representatives, whilst other firms had put their best men at the services of the seekers after truth.

M. P. SARGENT,
Hon. Sec. Oxford University Motor Club.

[Several other correspondents write in the same strain.—ED.]

COOLING ON LONG DOWN GRADES.

Sir,—In his article in last week's issue, Mr. Mortimer Batten, in drawing attention to the uses of the valve lifter and throttle as cooling and oiling agencies respectively, seems to have overlooked the fact that modern clutches and gears should enable most motor cycles to emulate, if not to improve upon, the average car in this respect, by coasting either with the clutch held out or by getting into neutral, which, although it may involve going through second, is possible at almost any speed, keeping the engine ticking over, and getting back into top when this is found necessary.

Any modern machine which is unable to do this should be inspected for faulty adjustment, and if it is not found possible to correct this fault, its design—either with regard to clutch, gear box, transmission, or wheel bearings—must be regarded as not at the top of its class. "PIN."

S.W.2.

RECORDS BY PRIVATE OWNERS.

Sir,—I should like cordially to support "Private Owner B.M.C.R.C.'s" suggestion. Provided the trade did not object the A.C.U. might show its interest in the purely private owner by drawing up the necessary rules. It is to be hoped that a stricter adherence to rules be observed than was the case in the B.M.C.R.C. private owners' handicap races this year.

P. O. BEMSHE.

Bromley.

CASTOR OIL IN ENGINE LUBRICATION.

Sir,—Now that the Show is a thing of the past, and motor cyclists have time to think over things, may I refer to the letter of Mr. L. F. Wright, who put forth some able words on "Castor Oil in Engine Lubrication," in *The Motor Cycle* of November 30th?

After a very clear summary of the essential properties of a lubricant, Mr. Wright in his last paragraph stated that he has found fatty acid in carbon deposits, which he correctly concluded are due to the use of a vegetable oil in the engine. But he looks upon this fatty acid content in such oils as a fly in the ointment, instead of as a pearl in the oyster; for recent research has now proved beyond doubt that it is this acid content which gives animal and vegetable oil its superior "oiliness."

The fact that it may cause corrosion is due to there being more acid either present in the oil initially or generated in it subsequently, than is necessary to give it the required oiliness.

Mr. Wright apparently is unaware of the *via media* in this matter which, however, is the subject of letters patents in many countries, and consists in using a mineral oil to which is added a very small percentage of fatty acid giving the oil the lubricating properties of a vegetable oil with the additional advantage of the quantity of acid being controllable and hence kept under the limits which cause corrosion.

Mr. Wright can refer to *The Automobile Engineer*, December, 1921, page 450, for further information, or better still to the writer, who withholds the proprietary name lest this correspondence should savour of advertisement.

JUSTIN H. WELLS.

TWENTY YEARS AGO.

Sir,—The remarks of Mr. B. H. Davies are always worth reading, and may generally be depended upon, but we fear his memory must have failed him when writing "When we oldsters rode the '1¾ h.p.' Clement-Garrard or the '1½ h.p.' Minerva, twenty years ago, there were no Sunbeams or Nortons, or Douglases."

Now, as a matter of fact, Nortons were quite a healthy little family more than twenty years ago, and they have been steadily and uninterruptedly (except in the war period) growing in beauty and power ever since. Before the days of motor cycle journalism the Norton Company was designing and building for the trade, and also under its own transfer.

From the first machine we built our faith in the motor cycle movement has never waned, and in spite of the "slump years," when a number of large firms nibbled at the motor cycle business and then dropped it to re-enter after the heavy pioneer work was done, we have continued manufacturing right through, and we believe we are justified in our claim to be the oldest purely motor bicycle manufacturing concern in existence to-day.

JAS. A. NORTON.
(Norton Motors, Ltd.)

THAT TENTH COMMANDMENT.

Sir,—As I write I am surrounded by volumes and volumes of your incomparable paper. Year in and year out have I absorbed the valuable information contained therein and its matter has been as a law unto me. "If I see it in *The Motor Cycle* it is so." But how are the mighty fallen! My pet idol has feet of clay. How sad is this world! After reading "Ixion" in the current issue my faith in his word is shattered; every statement he writes will in future have to be taken *cum grano salis*. To quote him: "Moses . . . forbade the faithful to covet each other's houses and servants . . . but . . . motor cycles were not invented at that era so a pious man may visit Olympia without committing deadly sin." Sir, Moses forbade houses, servants, or *anything that is thy neighbour's*. If "Ixion" has the temerity to submit that Mr. Norton or Mr. Matchless are not his neighbours I'll make him read his own comments. To soften the blow, however, Mr. Editor, I beg to thank the delinquent from the bottom of my heart for many and many a pleasant evening spent in the perusal of his "Reminiscences." Am eagerly looking forward to "Further Reminiscences."

Bradford. FAUNTLEROY L. LITTLE.

ALMS HILL WET.

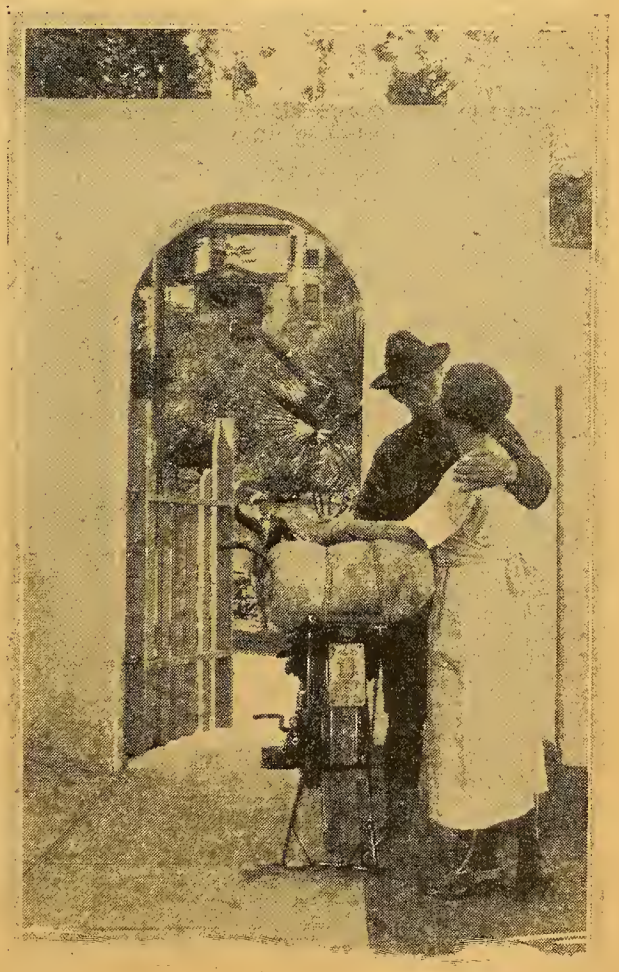
Sir,—May I inquire whether Alms Hill is considered climbable when wet, as I have made several attempts at it, in this condition, without success?

On a dry day I can get up quite comfortably on second, on my 550 c.c. Triumph, but on a wet day, if I open the throttle in bottom gear, the back wheel starts spinning and I skid into the ditch.

If I go sufficiently slowly to prevent wheel-spin the engine is turning round too slowly to take the "Cannons."

Hanon. EFFENNO.

[In a South Midland Centre trial this year several competitors made faultless ascents of Alms Hill at its worst. —ED.]



THE MOTOR CYCLE AND THE "MOVIES."

THE EXPLOITS OF 'ERB. (Episode 17.) 'Erb reassures Elaine that he will find the Flaming Disc in the Clutching Hand. It is interesting to note this, for most American clutches are foot-controlled.

32 H.P. FROM 350 C.C.

Sir,—I was most interested in Mr. B. H. Davies' article on the Show, but are we seriously asked to believe that one of the best firms in the country has "coaxed 32 b.h.p. out of a 350 c.c. engine"? Assuming an engine speed as high as 7,000 r.p.m., the above power output is equivalent to a brake mean effective pressure of 170 lb. per sq. in.! I think I am safe in saying that this figure has never been reached before by *any* other aeroplane, car, or motor cycle engine at *any* speed on *any* fuel. Looked at in another way the claim is equivalent to an output of over 91 b.h.p. per litre capacity. The best result obtained from the Vauxhall 3-litre T.T. car racing engine this year on special fuel was 43 b.h.p. per 1,000 c.c.—*i.e.*, something under half the above figure! Further, the wonderful 2-litre Fiats which won the Grand Prix were never claimed to give more than 47 b.h.p. per litre at the very outside.

Will the firm in question confirm the figure given by Mr. Davies, as such an achievement should not be allowed to hide its light under a bushel? FRANK B. HALFORD.

HARDIER NORTHERNERS?

Sir,—In view of the immense number of pros and cons on the above subject, perhaps it would be advisable to quote from personal experience only.

In our club we have but one Lancastrian member, and he very very seldom puts in an appearance at our competitions. Maybe, of course, he finds them too soft for his Northern taste; but, on the other hand, I have heard him protest that our "billiard table roads" (to quote Mr. G. R. Sylvester) "cut his tyres about too much," and "that it's only a mug's game to enter these trials." As a proud official of the club, I am ass enough to be pleased that mugs predominate.

As for Southern terrain, the M.C.C. appear to find plenty of stiff going in our areas for their purpose, and their trials are famous.

We ourselves are supporting an inter-club team trial to be run off at night this month. The well-known Kentish hills of Cudham, Crown Ash, Titsey, and Hogstrough will be included, in addition to the usual colonial sections.

Last winter we held a flexibility test on Saltbox Hill in the snow. *And* it was well attended. "BEAM."

Bromley.

[We learn from our Kent correspondent that the South-Eastern Centre inter-club night trial has been abandoned owing to insufficient entries.—ED.]

Sir,—"Park Rash" got very near the mark when he compared the men of the North to the denizens of the hills, and the men of the South to those of the plains. Let us leave the question of manners aside. They are the means by which a broadminded man shows his consideration for others, and can take an infinity of variety of form. On the Scott stand at Olympia I heard, "Sit on it, it'll cost ye nowt," in the homeliest of broad, good-natured voices. I might have heard a soapy voice drawl out, "Just try the riding position, sir; I can assure you that we don't make any charge for this privilege."

It isn't the manner or the voice, it is the man behind it that matters, and will "Park Rash" kindly note that there are also hills in the south, from where I come, and what they lack in sheer ruggedness they make up for in beauty of detail, and the fact that the sun shines on them quite a lot. 90 BORE.

Middlesex.

Sir,—"Ixion's" remarks on this subject appear to have upset the tranquillity of several southern motor cyclists, and caused a great deal of unnecessary heartburnings.

Motor cyclists, on the whole, whether they reside "up North" or "down South," are a body of sportsmen, and quite capable of adapting themselves to any conditions or environments which may occur whilst following their favourite pastime.

Those riders like "Benurow" (whose *nom de plume* camouflages the name of a well-known and successful T.T. and trials rider), who have had a long and varied experience of riding under all conditions throughout the country, are agreed that "up North" the severe nature of the country does breed a very keen and hardy type of rider; but nobody suggests that a Southerner coming to reside "up North" would sell his "'bus" after a few weeks of riding under our conditions, and take up some other less strenuous pastime.

W. H. TAYLOR.

THE AMATEUR ROAD RACE.

Sir,—I notice with great pleasure your announcement that an amateur road race will be held in the Isle of Man.

As one of the prospective competitors I hope it will be a real race, *i.e.*, the same distance and conditions as in the actual T.T. race.

Also, referring to the discussion between North and South riders now raging, why not make up a score sheet with some kind of trophy, to be won by the best division on points? By this I mean divide the entrants into classes, for instance: Scotland, Ireland, Wales, the North, the South, the Centre (the Midlands).

I am ready for my entrance form any time! Also, there are another six riders certain from Manchester.

CHARLES M. NEEDHAM.

POST-WAR UNIT CONSTRUCTION.

Sir,—In the article, "Through a Designer's Eyes," under the heading of "Unit Construction," it is stated that until recently the British firms which had tackled the problem seriously were almost negligible.

Perhaps the majority of your readers are unaware that a pioneer of unit construction design—the Wooler—was evolved several years ago.

Your contributor mentions several very desirable features obtained by the employment of unit construction, *e.g.*, elimination of the primary chain and part of the magneto drive, a constant flow of oil to all engine and gear parts, without employing a single external pipe, and a considerable increase in crank-case area, which would help to cool the engine.

Every one of these points is incorporated in the Wooler, where the oil circulates round the frame, and is thoroughly cooled and filtered before returning to the sump.

Having ridden both belt and chain driven models for more than a year, I cannot speak too highly of unit construction as exemplified by the Wooler. Usual disclaimer.

J. B. PERKINS.

HUB GEAR DIFFICULTIES.

Sir,—Being another impecunious owner of an old hub-geared 1914 Triumph (Sturmey-Archer) I should be glad if "An Old 'Un" or "B.C. 1499" would give me a few tips on gear changing. Ordinary gear box methods seem useless with my hub gear, as it positively refuses to change either up or down on the clutch, so that, if stopped in traffic "on top," I cannot change down until the engine is stopped.

The gear either remains in top with the rod hanging loose, or a blood-curdling shriek results. BREEZY.

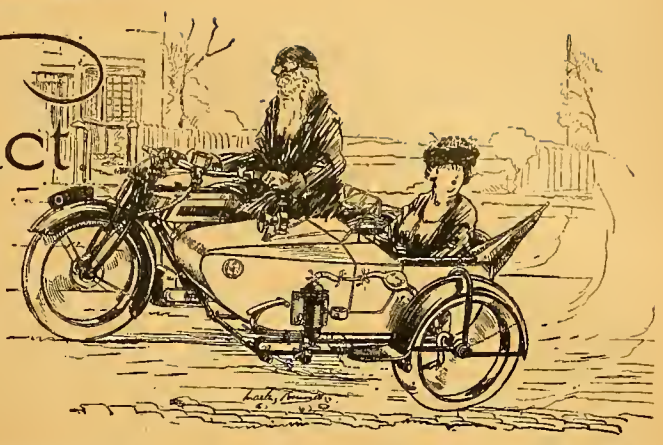
Accessories before the Fact



Revolutionary Inventions to make Motor Cycling More Interesting. First Fully Illustrated Descriptions of the Astounding Grabal Patents.

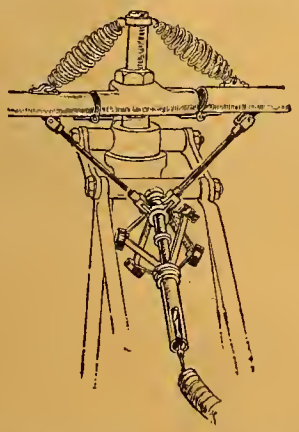
ALL motor cyclists will be interested to learn that the well-known firm of Messrs. Graphter and Balmie, Incorp., has decided to enter the motor cycle accessory market.

Hitherto, of course, this most successful business house has specialised in the sale, by post, of fibre-ball and elliptical-roller bearings, and correspondence courses on Couéism, relativity, book-making, the game of Beaver, etc., etc. Therefore the ingenuity, indeed genius, of the managing director of this go-ahead concern, Mr. Angus I. McCohen, is already common knowledge. But, to use his own words, Mr. McCohen does not think the motor cycle field has yet been as thoroughly exploited as it might be.

Catering for All.

The Grabal specialities, as the new products will be named, appeal alike to the speed man and the potterer, to the expert and the novice, to the family man and the man without a family.

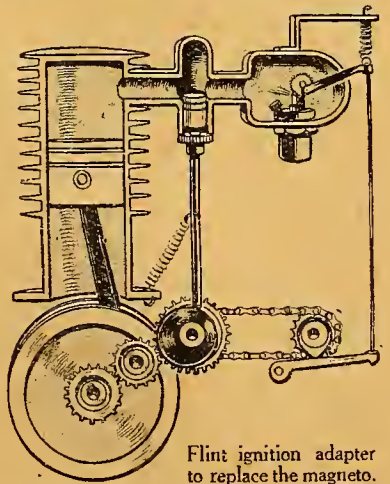
Not the least momentous invention is an automatic sidecar tyre pump. Every sidecarist knows that the weight carried in his sidecar is by no means a constant factor. The talented inventor of the Grabal pump, although not himself a sidecar driver, has recognised this. He attaches to any convenient chassis member the body of a cylindrical pump connected by tubing through a hollow sidecar axle to a pipe extending from the tyre valve and ending in a circular channel coincident with a ¼in. hole in the sidecar axle. The rest is simple. Attached to the sidecar body is the pump plunger member; and a release valve on the system is controlled by an ingenious arrangement of reversed pressure gauge and link mechanism bearing against the sidecar body so that the lower the latter falls the higher the pressure in the tyre, and *vice versa*. The drawing in the heading illustrates the device in action.



Centrifugal control of the automatically adjustable handle-bars, in the "20 m.p.h. and under" position.

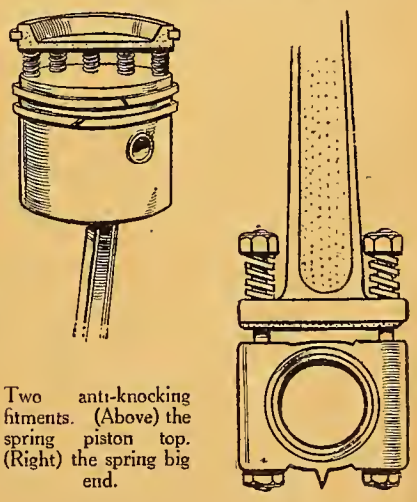
Centrifugally Controlled Handle-bars.

Next in importance, if not more so, come the Grabal automatically variable handle-bars, which change from the fully touring shape at 20 m.p.h. to the flat type at 50 m.p.h., and to the fully dropped pattern at 90 m.p.h. Each side of the bar is hinged at the steering head, being normally retained in the "up" position by two powerful coil springs. Two link members are directly connected to the collar member of a centrifugal governor, driven by a speedometer type flexible cable from a gear wheel on the front hub. As the speed of the machine increases the collar moves down, and with it the bars. By the addition of a suitable scale one of the bars becomes a speedometer needle. Like all great inventions, the idea is simplicity itself.



Flint ignition adapter to replace the magneto. The piston valve exposes the ignition chamber at the correct moment.

The puncture bogey has also received attention from Mr. McCohen. By one master stroke he eliminates this and the dust nuisance as well. Again his great brain has gone to the root of the problem and literally removes the cause before the trouble occurs. A powerful revolving brush and vacuum cleaner are mounted on the steering head, so that they sweep a clean path, 9.567 inches wide, in front of the wheel. There is some talk of introducing legislation to make this fitment compulsory on all motor vehicles. The saving to the country would be immense, especially if public-minded motorists could be persuaded to take kerb-side duty occasionally.



Two anti-knocking fitments. (Above) the spring piston top. (Right) the spring big end.

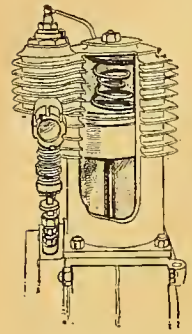
Magneto-less Ignition.

Quite in a different class, but none the less astounding, are some of the Grabal 365% efficiency increasing devices. One, for instance, dispenses with the magneto, admittedly a weighty, expensive, and unpatriotic instrument, and substitutes a flint spark mechanism, already familiar to, and respected by, the great general public in their cigarette lighters. The sketch in this case is self-explanatory. Suffice to say that a gross box of flints is sufficient for 1,876,921 sparks, and since

Accessories before the Fact.—
these cost only 4s. 11¾d., the infinitesimally low upkeep per spark is at once apparent. Incidentally, the company has purchased all the Boliguarian government's huge war stocks of flints.

No More Knocking.

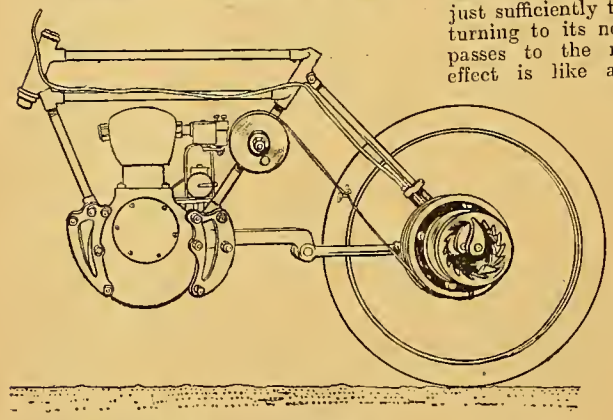
Even the most modern engines are prone to knock on occasion. No less than two Grabal fitments have been evolved



Cut-away cylinder, showing the Grabal recompressioner in position.

to banish the phenomena. One is a spring top piston; the other is a spring big end. Obviously by fitting both it is possible to do even more.

Owners who are hampered in selling their second-hand machines because their engines lack compression will welcome the Grabal recompressioner, which is a specially designed coil spring to be fitted in



By this device the energy of braking is stored and given out to assist the machine in its acceleration.

the combustion chamber. It restores lost compression miraculously, and, by its action in assisting the piston down on the suction stroke—a phase hitherto ignored by the designer—it is claimed to give a 17.625% increase of power. Further, it is very moderately priced, the 250 c.c. pattern costing only £19 19s. 11d.

Brainy Brake-work.

Two indispensable Grabal specialities affect the all-important question of braking. One, of the magnetic type, we regret we cannot yet describe in full, as one or two points remain to be perfected. It is extraordinarily ingenious, and automatically stops the machine dead within 20 feet of any obstacle directly ahead of the front wheel. Difficulty has, however, been experienced in narrow streets, where it has been found that the machine refuses to take a corner on account of the proximity of a brick wall across the way. Experiments, however, are being pursued, with every confidence, and the company is prepared to accept nominal deposits of £10 on the first batch of production models. Until these are available there is the combined brake and accelerator illustrated. A touch of the handle-bar button engages the pawl of a two-way free wheel in a pulley on the rear hub, and this winds up a cable from a frictionally retarded drum, which also contains a powerful spring. The machine is thus smoothly decelerated and ultimately stopped when the cable reaches a fixed stop. When the danger is passed the button is released, and the friction clutch on the drum is disengaged. The coiled spring releases its stored energy and greatly assists the engine is accelerating. For a sufficiently large fee only *one* licence to use this device in the T.T. will be issued.

Soundless Silencing.

Next to braking, silencing is perhaps among one of the not least important points requiring attention at the present moment. Here again the master mind has strayed from the beaten path of convention. The Grabal No. 1 silencer consists of a plain exhaust pipe made of a fully-patented elastic substance, not unlike rubber. Thus, immediately the gases leave the exhaust port the pipe expands just sufficiently to accommodate them, returning to its normal size as each burst passes to the rear. Externally, the effect is like an ostrich eating large apples; and the device, instead of magnifying the sound like an ordinary resonant metal expansion chamber, causes silence so complete that it is impossible to tell whether the engine is running or not without watching the pipe very carefully.

On the other hand, some fortunately situated motor cyclists, and most professional speed men, do not object to noise. They, too, have been catered for—by the Grabal No. 2 silencer (or extractor). An annular chamber on the exhaust pipe, and directly connected thereto, is exhausted by the swift rush of the gases. From this vacuum chamber is led a pipe to the exhaust port, thus assisting in securing perfect scavenging and greater efficiency (17.625% to be exact).

Then mention must be made of the Grabal automatic gear change. In effect it consists of a weighted extension to the gear lever, sufficiently heavy to move it down one notch on all gradients above 1 in 10 and two notches on 1 in 5 or steeper hills. On the level ground being reached again a reverse action takes place. It is easily fitted, instantly adjustable, heavily constructed, and guaranteed for three years after the war against breakage.

Further Patents Pending.

It would be impossible to describe the full Grabal range in one issue of *The Motor Cycle*, but it may be said that among other epoch-making and revolutionary fitments are such diverse and remarkable articles as collision-proof number plates, mudguards and footrests of rubber, a magnetised carrier for carrying tools and repair outfit accessibly instead of in the old-fashioned tool bag, and a

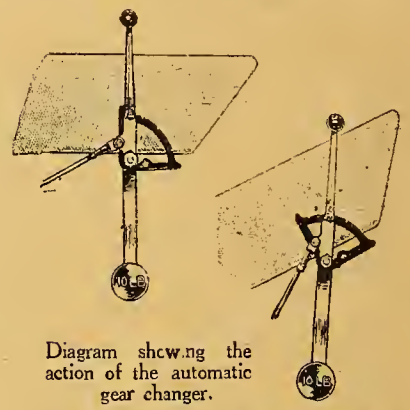


Diagram showing the action of the automatic gear changer.

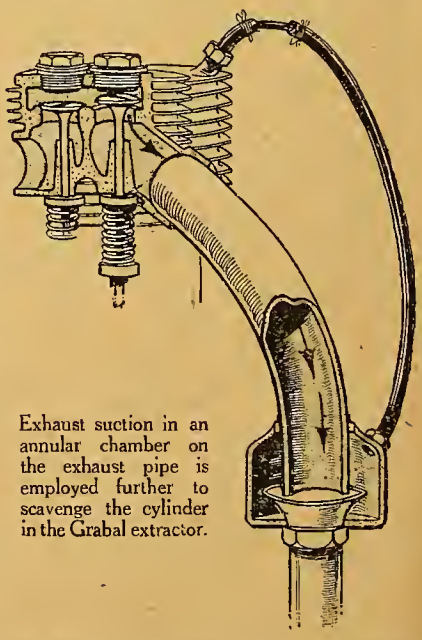
(Left) Machine on level road, lever in top gear; (right) machine on a hill, lever in second gear. Neutral is avoided by redesigning the gear box.



Exhaust suction in an annular chamber on the exhaust pipe is employed further to scavenge the cylinder in the Grabal extractor.

lattice-work type extensible lamp bracket for driving in fog and obtaining a clear view round corners.

As we go to press we hear with regret that Mr. McCohen has been removed to a private nursing home, but letters addressed care of the Editor will be forwarded in due course.

The Christmas Trial

Details of the "New" Hill and a Complete Guide to the Trial. 199 Solo, Sidecar and Three-wheeler Drivers.

ON Boxing Night (Tuesday next) the customary band of heroes—308 in all this year—will foregather at Staines for the M.C.C. London-Exeter-London run. Of these 308 entries, 95 are solo riders, 90 will drive sidecars, and 14 three-wheelers.

Hill Climb in Darkness.

The ronte of the outward journey is exactly the same as last year, but Peak Hill, Sidmouth, which No. 1 of the long string of competitors climbs in the darkness of 5 a.m., is now a non-stop section. There were quite a number of failures here last year, but comparatively few lost marks as the majority had enough time in hand to scramble to the top somehow. The fact that failure now means a certain loss of marks should have an appreciable effect on the award list.

On the other hand, the inclusion of White Sheet Hill, near Beaminster, will probably prove a disappointment in this respect. Several members of the Sarum and District M.C.C. rode over on the week-end before last to try the new "find" and report that it is unlikely to cause any great trouble.

White Sheet is approached from Beaminster along a narrow road, usnally wet, the first half-mile being an easy rise. Then comes half a mile with an average gradient of 1 in 10, followed by about 600 yards of 1 in 6 with a comparatively gradnal left-hand bend where the gradient is 1 in 5. Trees overhang the road from the bend upwards, and the surface is somewhat soft, but, at the time of inspection, there was a moderately hard track on either side. The gradient eases some distance before the summit, but increases to 1 in 6 right in sight of the top.

If it rains on Boxing Night, as it almost assuredly will, careful driving may be necessary. Solo machines should keep to the left and sidecars to the right.

Incidentally during the visit of the Salisbury Club good ascents were made by Miss M. Horrell (269 Clyno), Miss M. C. P. Timpson (225 Royal Enfield), M. C. Thorne (247 Levis), and Capt. A. P. Thorne (Aero Morgan).

New Section.

From the top of the hill to the main Maiden Newton-Dorchester road (approximately one mile) is a narrow, muddy lane.

Salcombe Hill, which of course is reached before White Sheet, was climbed last year, when it caused several sidecars—but more cars—to fail owing to wheel-spin.

Those who intend to watch the competitors *en route* will find the time of the first man at any point from the accompanying schedule.

125. J. Morris (550 X.L.).
126. B. Bourke (595 New Hudson).
127. V. F. Long (976 Excelsior).

CURRENT CHAT

Times to Light Lamps.

Dec. 21st	.. ..	4.21 p.m.
„ 23rd	.. ..	4.22 „
„ 25th	.. ..	4.23 „
„ 27th	.. ..	4.25 „

One number plate must be illuminated as above *vide* Road Vehicles Registration and Licensing Order (1921). According to the Lights on Vehicles Regulations (1903) the lamps ordinarily required by law may be lit half an hour later.

In Season.

The first 365 days of the year are the best for motor cycling.

Hints for Beginners.

How to make a cheap motor cycle stand—lean it against a wall.

Trying It Out.

A single-cylinder outside flywheel sports model with a new 500 c.c. engine will make its *début* in the Exeter.

Another Club Dinner Story.

Member, who has dined well but not wisely, making violent kicks at the spring-stand of his Norton : "Oh, —— this cold weather" !

The Italics Are Ours !

A motor noter : "Referring to his wonderful ride in 1911, *which I described last week* . . ." Congratulations on the scoop !

£10,000,000.

During the year ending March, 1922, a sum of well over ten million pounds was collected by motor taxation. The cost of collection was approximately 3%.

Road Costs.

Twelve and a half million pounds were credited to the Road Fund last year; eight millions were expended on main road work and four and a half millions on unemployment schemes.

Before and After.

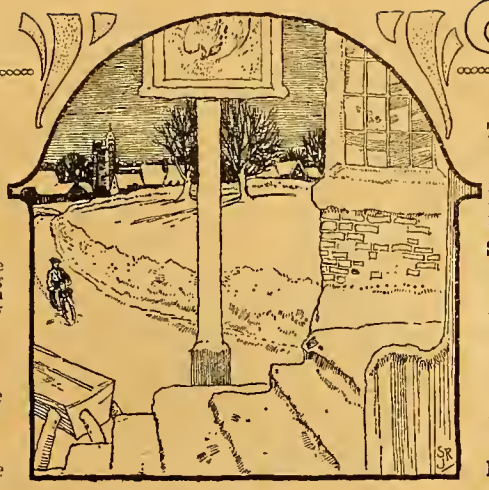
As it was : "Crack, crack, crack!" As it is : "Plonk, plonk, plonk!" A famous single-cylinder mount is now being equipped with large expansion chamber and tail pipe in lieu of the straight-through system previously fitted.

A.C.U. Annual General Meeting.

The annual general meeting of the Auto Cycle Union will be held at the Royal Automobile Club, Pall Mall, London, S.W.1, at 2.45 p.m. on Friday, January 19th, and will be followed by the annual meeting of individual members.

Familiarity Breeds Contempt.

Porlock Hill has lost its terror for the clubmen who live in the West. The Bristol Club has ignored it for two seasons past, for the reason that it does not find a winner; on the last occasion in which it figured in the programme it was climbed successfully twice in the day by every competitor except one, and some of the officials rode up and down half a dozen times in the day.



Imports and Exports.

During the last few months there has been a gradual but definite increase in the importation of machines. The figures for November show an advance on the previous month of £3,000.

	1920.	1921.	1922.
Value of machines ..	£13,725	£1,499	£2,137
Value of parts	£6,766	£4,727	£7,286
Total	£20,491	£6,226	£9,423

The increase of imports coincides with an increase in our exports, which is really more vital to the national well-being. The value of exports in motor cycles shows roughly £6,000 increase both over last month and the corresponding month last year. But to observe that there is an increasing overseas trade, even though this increase is only gradual, is reassuring after the depressing export returns for the summer months.

	1920.	1921.	1922.
Value of machines ..	£166,405	£26,794	£27,412
Value of parts ..	£82,284	£17,500	£23,167
Total	£249,689	£44,294	£50,579

The Newcomers.

Quite a number of recently marketed machines appear in the entry list of the London-Exeter run, several of which are miniatures of very small capacity.

Sensible Traffic Regulation.

Birmingham has introduced a very sensible new traffic rule. Drivers of vehicles stopped at a cross-road by a police officer are requested to divide themselves into two files, the inner or left-hand stream to consist of those who wish to turn to the left at the crossing, which they may do without waiting for the release signal.

Not a Fairy Tale.

Scene : A local agent's depot two weeks before Christmas.

Owner of a large car drives up and calls out the agent. "I want a good motor cycle for my nephew; what have you got?"

The agent promptly recommended his best line. The client wrote his cheque in the car without inspecting the mount. "See that it is delivered on Christmas Eve," was the parting instruction.

Something like an uncle !

For Overseas Motor Cyclists.

All who are resident abroad, as well as members of the Navy, Army, Air Force, Diplomatic Service, or Mercantile Marine who are abroad at least three months in a year, may become overseas members of the A.C.U., and as such are entitled to full privileges when at home. When abroad they are supplied with news in the shape of a quarterly budget, or certain numbers of *The Motor Cycle*, such as the Show, T.T., and Six Days Trials report issues, which are posted to them direct. The cost of overseas membership is 10s.

ANOTHER TOLL ABOLISHED. Vehicles in future will be permitted without payment to pass over this bridge which spans the river Hamble at Bursledon in Hampshire.

Not to be Taken Seriously.

We wish to make it quite clear that the names mentioned in the mechanical *jeu d'esprit*, on p. 959, are entirely fictitious.

The Weather at Christmas.

There is every likelihood of the weather at Christmas being mild and dry, for the official weather prophets forecast frost and snow.

Careless Competition Riders.

Last Saturday's London-Gloucester-London Trial was notable for the disgraceful inefficiency of quite 75% of the competitors' lamps. Even acetylene lighting properly looked after should be perfectly reliable.

A French Brooklands?

At Montmorency, about 9 miles from Paris, it is proposed to erect a track which will primarily be constructed for the testing of motor cars for trade purposes. It is thought, however, that it will eventually be available for public races.

Renewal of Licences.

It is estimated by the Ministry of Transport that over 800,000 motor licences will expire on December 31st, most of which will be renewed. In order that the work of renewing licences may proceed expeditiously it is essential that motor cyclists should see that their applications for renewal are in order and submitted promptly. Renewals may be had at the principal post-offices, except if there has been a change of ownership since the last licence was taken out, or if the old licence has expired more than fourteen days previously.

START OF A 1,400 MILE JOURNEY. Two enthusiasts who came from Prague to visit the Olympia Exhibition about to start on their long journey home after taking delivery of their 986 c.c. B.S.A. sidecar at the works in Birmingham.

Preparing for the Winter Runs.

If we are favoured with a few days of bright frosty weather at Christmas many owners who usually travel by train may utilise their machines. The suggestion that machines should be looked to before the day they are required ought really to be superficial advice; unfortunately it is advice that is not heeded by very many owners.

The "Die-Hards."

The majority of the old "never again" London-Exeter riders will turn up as usual on Tuesday night. They will, it is expected, register the same old vows on its conclusion.

Unexpected Praise.

"Who?" asked a competitor at the finish of a recent trial, "was responsible for the arrowing between —— and ——?" There was an instant chorus of "Some people are more satisfied . . ." "If you can do the job better yourself . . ." etc., from officials standing near, when the original speaker broke in quietly: "I only wished to congratulate him!"

The 1923 French Grand Priz.

Sunday, June 24th, has been selected by the U.M.F. as the date of the French Grand Prix (Circuit de Touraine). The car races—the Grand Prix de Tourisme and the Grand Prix de Vitesse—will be held on July 1st and 2nd respectively. It was announced at the F.I.C.M. meeting in London that the date of the Belgian Grand Prix would be 15 days later than that of the French.

Insurance-Press Propaganda?

Ten little English boys playing round a shrine,
A motor-bus ran over one, and then there were nine.
Nine little English boys setting out to skate,
A sidecar ran over one, and then there were eight.
Eight little English boys, eyes as blue as heaven,
A motor-cycle snaffled one, and then there were seven. . . .

Several readers have written expressing disgust at a lengthy effusion in a leading daily newspaper starting (and continuing) as above. It is entitled, more aptly, perhaps, than was intended, "A nursery rhyme for grown-ups"; so why worry?

CLUB NEWS.

Bristol M.C. and L.C.C.

Among the officers elected for the ensuing season at the annual general meeting were the following: Mr. C. T. Pearce, president; Mr. Rex Foweraker, hon. secretary; Mr. E. Kickham, captain; Mr. H. T. Seamp, hon. treasurer. The club's membership is over two hundred, while the secretary's and treasurer's reports showed a very strong position.

Newark and District M.C.C.

It is proposed to form a club as above, to be distinct from the existing motor and motor cycle club. An inaugural meeting will be held at the Palace Cafe, Newark, on the 3rd prox., at 7.45 p.m., which those interested are earnestly requested to attend. Meanwhile, any information may be obtained from Mr. W. G. Donald at Donald's Garage, London Road.

Wessex Centre A.C.U.

All the clubs of the Centre were represented at a board meeting held at Bath on the 7th inst. Mr. Eli Clark reported the allotment of the first open speed trials for 1923 to the Centre, and a sub-committee consisting of Messrs. Kickham, Simpson, Gibbs, and Moore was appointed to run the event. A scheme of inter-club team contests is being considered.

Birmingham M.C.C.

On Saturday, December 30th, a half-day sporting trial will be run with solo and passenger silver cups to be won outright. The marking is such that time-keeping and skilful driving will be of almost identical value. Particulars may be obtained from Mr. H. Riley, 94, Yardley Rd., Little Bromwich, Birmingham.

Bradford M.C. and L.C.C.

Thirty-six out of forty-one starters finished the course of the club's annual winter trial run off on the 10th inst., results of which are now to hand. The Richmond Trophy (won outright) was secured by D. Rhodes (578 c.c. Scott Sociable), while R. A. Bourne (Perry light car) tied with him, and was awarded a silver cup (won outright). Third place was taken by H. G. Mitchell (Jowett light car), for which he is awarded a silver medal.

Prescot and District M.C.

A very successful carnival was held at the Parish Room, Prescot, on the 11th inst. Early in January the club will hold its annual dinner and prize distribution.

Two of five members of the Richmond and District M.C.C. who advertised the club's exhibition of "The Motor Cycle" film by a novel method.

Worcester and District M.C.C. and Worcestershire M.C.

At a meeting held on the 11th inst. a satisfactory membership and treasurer's report was presented, and a substantial honorarium was presented to Mr. Howell in recognition of his services as hon. secretary.

Several witty speeches were made at the annual dinner and presentation of prizes held on the 7th inst. under the chairmanship of the club's patron, Lord Beauchamp. "I firmly believe that not long hence the time of a member's departure from one place will synchronise with his arrival at another," said one speaker, referring to members' successes in various speed events.

East Midland Centre A.C.U.

Being desirous of developing the movement in Lincolnshire the centre suggests that there is scope for a club in Bourne, Boston, Skegness, Louth, Scunthorpe, and Brigg. All interested and willing to assist should communicate with the hon. secretary, Mr. K. S. Topping, 64, Frederick Street, Loughborough.

South Shields and District M.C.C.

The above club held its annual dinner at the Regent Hotel on the 11th inst., the president, Mr. Wares, presiding. During the course of the evening Mrs. Wares presented trophies won during the season. The annual general meeting will be held early in January, when officials for the ensuing year will be elected.

North-West London M.C.

Considerable interest is being shown in the Club's "Schoolboys' Competition" to take place on the 13th prox., but it is realised that passenger machines are not popular, and the organisers have therefore decided to accept teams without the required passenger outfit. The closing date for the trial is January 1st, and full particulars are obtainable from the organiser, Mr. O. B. Smyth, 114, Denbigh St., London, S.W.1.

CLUB FESTIVITIES.

Well-attended Annual Dinners in the Midlands and the North.

Edinburgh and District M.C.

AS one might expect, there was an excellent representation of motorists from all parts of Scotland at the annual dinner of the Edinburgh and District Motor Club, during which one of the chief features of entertainment was the showing of *The Motor Cycle* Film, run off at intervals between song and speech. In the absence of Mr. Graham Davidson, Mr. Campbell McGregor, the energetic secretary, presided during the initial portion of the evening, but later Mr. Davidson arrived.

The chief speaker was Mr. Robert J. Smith, of the R.S.A.C., who proposed "The Club." Mr. Smith paid a sincere tribute to the memory of Sir H. A. Macdonald, to whom so much is owing in connection with the automobile movement in Scotland, and he proceeded very ably to discuss the political aspect of club life. He urged that very important matters, such as just taxation and the abolishment of the speed limit, were at present before those working in the interests of the motoring community, and if that community realised to the full how much its future interests are involved, there would certainly be no lack of support. The question of taxation has now almost reached unanimity, and even the owners of commercial vehicles are agreed that the tax on spirit presents the only reasonable course.

In addition to the film, which was very enthusiastically received, there were some excellent conjuring performances and musical items.

Coventry and Warwickshire M.C.

A VERY happy gathering took place at the Craven Arms Hotel, Coventry, on the occasion of the Coventry and Warwickshire Motor Club's annual dinner.

Mr. J. K. Starley, in the absence through indisposition of the president (Lieutenant-Colonel J. A. Cole), officiated as chairman, and the guests of the evening were Lieutenant-Colonel F. S. Brereton (chairman of the Auto-Cycle Union), Major L. A. Baddeley (chairman of the M.C.C.), Major R. Vernon C. Brook (chairman of the Midland Centre, A.C.U.), Mr. W. G. McMinnies, and Mr. R. W. Duke.

Mr. J. F. Spencer, in replying to Mr. Starley's toast of "The Club," remarked that the club was held in very high esteem by all other motor clubs in the country, and claimed the honour, together with one other club, of being the second oldest of its kind in the country. There were two directions in which the club was prominent—the first in speed events and the second in team trials. In connection with speed, the speaker referred to Mr. Walter Brandish, junr., one of their most respected members, who was second in the Tourist Trophy (Senior) race this year. In addition to this, Mr. Spencer said the previous year Mr. Brandish's times were remarkable, in so far as they did not vary more than two minutes in each lap, "and I am given to understand he will be first next year," added Mr. Spencer, amid laughter.

Mr. Geoffrey Smith warmly complimented Colonel Brereton on his interest in the motor cycle movement, and remarked that the work involved was a great deal more strenuous than was generally realised.

A very enjoyable musical entertainment was given during the intervals, and during the course of the evening the year's prize-winners received their trophies from Mr. Roberts.

Bradford M.C. and L.C.C.

OVER 170 members and guests, including ladies, attended the annual dinner of the Bradford M.C. and L.C.C. at the Royal Restaurant, Bradford, on Friday, December 15th.

The toast list was an extensive one, interspersed with songs by the club's "own" rag-timers, the Dewhirst Bros. A feature of the menu card was the inclusion of a *résumé* of the year's competitions, giving the nature of the events, the number of entries, starters, and finishers, and the award list. Prizes were distributed during the evening.

Sutton Coldfield and North Birmingham A.C.

THE tenth annual dinner of the Sutton Coldfield and North Birmingham Automobile Club took place in the Assembly Rooms of the Royal Hotel, Sutton Coldfield, Friday, December 15th. There were present many well-known members of the motor cycle trade and prominent persons in the locality, as well as a large number of competition riders who had distinguished themselves during the past year.

In proposing "The Club," Major R. Vernon C. Brook emphasised the necessity of every rider supporting his local club and thus, indirectly, the governing body. In response, Mr. Frank Whitworth pointed out the good work which had been done in the past by the club and its officials, stating that the club, which was founded in 1908, was not only one of the oldest but also one of the most go-ahead bodies in the Midlands.

In a witty speech, Councillor George Hooper proposed "The Ladies," remarking that he was delighted to find that there were seven lady members of the club, most of whom took an active part in competitions. The toast was responded to by a lady, Mrs. A. Henderson, whose speech, though very short, met the requirements of the case admirably.

The Editor and Staff of "The Motor Cycle" extend to all readers—young and old, at home and abroad—greetings for a happy Christmas and Prosperous New Year.

LONDON—GLOUCESTER—LONDON.

Dark Deeds on Kop Hill. Muddy Roads in N.W. London Classic Trial.

JUDGED by the route card, last Saturday's London-Gloucester-London Trial—the twelfth of the series—was not difficult. Actually, a minimum time allowance at the checks, greasy bye-lanes, and a non-stop section in the dark, including Kop Hill, combined to make the event arduous enough to be sporting, or sporting enough to be arduous (according to how one looks at these things).

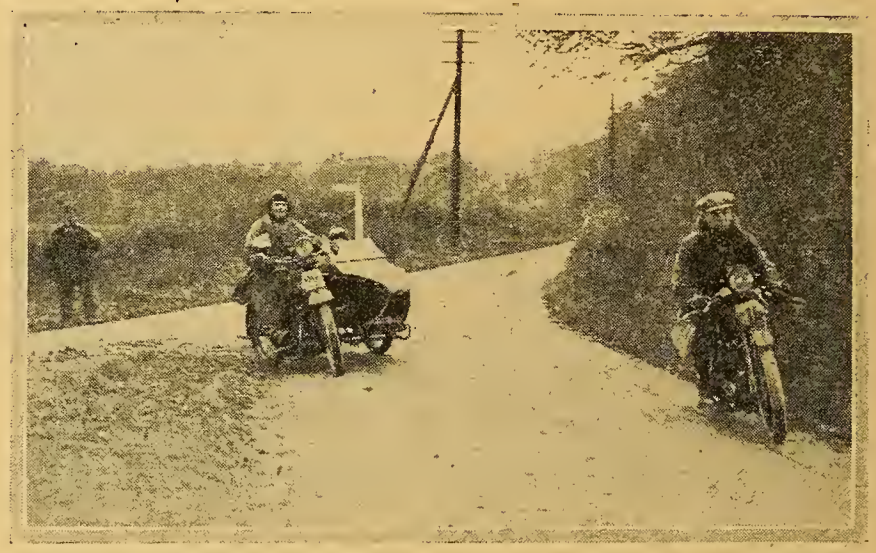
Consequently the North-West London M.C.C.—the organising club, and, incidentally, an amateur body—will not have to find an award for each of the seventy motor cycle starters after all; and if there had been more observers on Kop, a still greater saving might have been effected in this respect.

Embodied in the trial was an inter-team contest between the North-West London M.C.C., the Birmingham M.C.C., the Essex M.C., the Coventry and Warwickshire M.C., and the Surbiton and District M.C.C.

Main Roads at First.

The 8 a.m. start took place at the De Haviland Aerodrome, Edgware, but since the Edgware Road has been put in order conditions did not justify an observed section in the first twenty-five miles to Tring. The main roads were left behind and a merry scramble ensued, through the Chilterns to the Oxford Road.

Waterworks, Whyteleaf, and Kingston Blount were the chief test hills, but a succession of faultless ascents made the observer's task a monotonous one, enlivened only by the difficulties of deciphering the *blue and black* number cards.



One of the most acute bends in the event was the turn from the summit of Whyteleaf towards Kop. The riders are C. C. Labin (738 Martinsyde) and R. B. Clarke (925 Clyno sidecar).

On Kingston Blount, thought by some to be the least easy of the three, many of the competitors simply crawled up, obviously under the impression that a park of spectators' machines at the summit was the next check. For this reason it was doubly difficult to differentiate between the various climbs, and it will suffice to say that the new 349 c.c. B.S.A.'s made a very promising debut, as did a 348 c.c. Grigg Viper in the hands of E. M. Gwynn.

That a Morgan overtook D. W. Rhodes' Scott-Sociable may only mean that Rhodes was not in a hurry, and that W. Brooke's 348 c.c. Cotton was considerably faster than most of the larger solo machines may similarly have been because Brooke was.

Nobody failed, but M. K. H. Bilney (249 Holroyd), who had lost his contact-breaker cover and was very late, footed once.

Trouble in the Non-stop Section.

D. H. Noble (654 Quadrant sc.) punctured his sidecar tyre shortly after entering the non-stop section, but gamely carried on without loss of marks. D. F. C. Fitzgerald (490 Norton) bore signs of having had a tumble, not a surprising occurrence, for the roads were slippery enough to be treacherous without being uniformly bad enough to demand continued caution. R. J. Piper (998 Indian sc.) also appeared to be having a lot of trouble, but managed to keep going.

There was another check on the Oxford road, and thereafter it was plain sailing to Gloucester by the most direct route (down Birdlip; up coming back). There had been a considerable amount of rain during the night, and there was some mud; but there was no excuse for the serious roadside tinkering indulged in by many competitors.

It was necessary to light up before the early starters had gone twenty miles on the return journey, but until the first electrically-illuminated arrow pointed the way down Kingston Blount Hill, the going was good, and practically all had time in hand at the Lambert Arms check.

D. F. C. Fitzgerald (490 Norton) on a picturesque corner in the non-stop section, typical of the whole trial.

Gloucester—London—Gloucester.—

But a trials course that is easy in the daylight becomes remarkably difficult at night. Solo, one skids more. Lamps have not reached a high pitch of excellence. Engines *may* run better, but steering certainly is not made easier.

Long before Kop was reached several riders were unofficially noted to damage their non-stops, and usually their footrests and lamps at the same time.

The hill itself presented some curious spectacles. A soloist with flickering headlamp would come shooting out of the darkness down below in fine style, but right on the steepest part he would suddenly lose all control and run into the bank. If he was quick he might get away before one of the solitary three observers rushed up to find out his number. Rain fell before half-a-dozen competitors had passed, and the surface—not too good to start with—gradually became worse and worse.

The officials did not attempt to mark down the successful people; at least two wily failures recognised this and flatly refused to give their numbers when asked. Probably, too, all the cases of missing number cards had not been caused accidentally.

Any report of the performances on the hill must needs be qualified as accurate only as far as circumstances and visibility permitted.

H. W. Deacon (490 Norton) and W. H. Hardman (993 Matchless sc.) led the van in faultless style. Three unrecognisables followed, then a Morgan (thought to be H. E. K. Sawtell's) steaming badly but going strong.

C. W. Bairstow's Indian sidecar went up very well, leading a long string, including a soloist (? L. Crisp on a Humber) without any lamps at all, and picking a precarious path by the light of a sidecar passenger's electric torch in front. B. F. G. Fowkes (349 Beardmore B. and S.) was sure but slow, so slow that balancing must have been difficult. The Scott Sociable had a healthy hum but also was slow; apparently its occupants feared wheel-slip, for the passenger crouched over on top of the driver.

One of the new B.S.A.'s was excellent, as also was a Cotton and a Wooler, but another Wooler was seen to run up the bank higher up. The same fate, at the same spot, overtook C. W. Dickenson (498 Ariel).

After much clutch-slipping C. L. Sprosen (348 Connaught sc.) stopped temporarily right on the brow of the hill, and P. W. White's 700 c.c. Raleigh sidecar petered out just behind. R. Pugh's 499 c.c. Triumph sidecar made a particularly fine climb, but what looked like L. V. Freeman's big Sunbeam outfit nearly brought a fast ascent to an inglorious end owing to wheel-spin.

L. W. Goddard (993 Matchless sc.) failed absolutely, but eventually got away under power. The last of the motor cyclists positively observed to fail was E. Eland (225 Royal Enfield).

When darkness settled down once more and the last observer was about to move away, No. 13, E. A. Marks (349 A.J.S.), turned up and decided to retire, having experienced the lack of stability on grease usually accompanying such a number if mechanical troubles remain absent!

The most difficult check of the day came a few hundred yards after Kop, and although there were no more serious obstacles between here and the finish, spills were still common. F. V. Edward's flat twin Harley, for instance, refused to recognise that the trial was over after Watford, and executed a spectacular spill on the Edgware tramlines.

F. V. Edwards (548 Harley-Davidson) and F. M. Gwynn (348 Grigg) leading a file of solo riders up Whyteleaf.

"THE MOTOR CYCLE" FILM.

CONGRATULATORY letters continue to reach us from secretaries of clubs and institutions which have had *The Motor Cycle* film.

Considerable enthusiasm was displayed by the audience at the Cosy Cinema, Queen's Ferry, near Chester, where, the manager informs us, the film was received with loud applause by the audience, many of whom had ridden from Wrexham, a distance of 12½ miles, on purpose to see it.

The Widnes M.C. was more than delighted with the film, which was shown to a packed house, and a member of the audience was heard to remark that the film was all that could be desired but it was a pity there was no noise! The secretary has made application for next film for an early date in 1924.

The members of the Altrincham County High School Old Boys' Club followed the races for the Tourist Trophy with the keenest interest, while gyrations of sidecar drivers in a trial over very muddy roads caused plenty of amusement.

Not only is the 1922 film in circulation, but applications are occasionally received for last year's. This was the case with the Eton College Scientific Society, whose secretary writes:—"Everyone who saw the film thoroughly appreciated it, and a vote of thanks to you for loaning it was carried unanimously." Eton will have the 1922 film at a later date. The Barrow and Dist. M.C. and the Loughborough and Dist. M.C. have also been allotted both the 1921 and 1922 films.

Of the southern film, the secretary of the Blaina and District M.C.C. states that everybody was highly pleased and that *The Motor Cycle* film was the best picture on the programme.

Where to See the Film.

Southern Film.

THURSDAY, December 21st.—West Kent M.C., Grand Hall Cinema, High Street, Bromley.

FRIDAY, December 22nd.—Ashford M.C. and L.C.C., Palace Cinema, Tufton Street, Ashford.

THURSDAY, December 28th.—Norfolk M.C. and L.C.C., Theatre de Luxe, Norwich.

Northern Film.

THURSDAY, December 21st.—Saltcoats and District M.C.C., La Scala Picture House, Saltcoats.

FRIDAY, December 22nd.—Montrose and District M.C.C., The Municipal Cinema, Burgh Hall, Montrose.

TUESDAY, December 26th (Boxing Day).—Inverurie M.C., Town Hall.

By H. MORTIMER BATTEN, F.Z.S.

Illustrations by Le Ray.

Reminiscences of Christmas in Other Lands.

"Hi, you laddie with the red motor cycle! Your turn!"

A huge log fire, all alone in the great grey loneliness. It is Christmas. Ruddy faces brighten and glow like burnished copper in the ruddy light. Somewhere a coyote howls, and, as though in response to the wild, thin cry, the man with the mouth organ plays a few silver notes. They melt off into the infinite, vague and vast and all around——melt like the cry of a gull in the wake of a liner. Our own voices seem minute, so great is that great grey loneliness, and, peering round at the desert and the stars and the buttress of distant blue hills, we wonder how we dare to be here—such minute atoms of creation, such creeping, crawling things on the face of God's great work.

Round the Camp Fire.

"Kick it in, son!" says the man who had spoken previously. Seated on a log nearest the fire, he is chairman of the proceedings. "The tale of a woman. Good or bad, any woman you have known. There ain't likely to be more than one. It's your turn, you with the red motor cycle."

So there is nothing for it but to kick it in—the tale of a schoolgirl and her governess, and of the *café* girl who hadn't panned out just as a nice *café* girl should—the *café* girl who went limp after pushing a sidecar outfit only 7 miles. I coughed the story out, and the silence closed again. The man with the mouth organ ran his lips back and forth along it, finishing with a significant "pom-pom." Then he polished it carefully, and for the twentieth time that evening he restored the precious little weapon to his shirt pocket.

"That's all?" queried the president.

"That's all, Bill."

"Well, you haven't seen much. Your turn, Panhandle Jake. Remember, it's Christmas, and we don't want no murders."

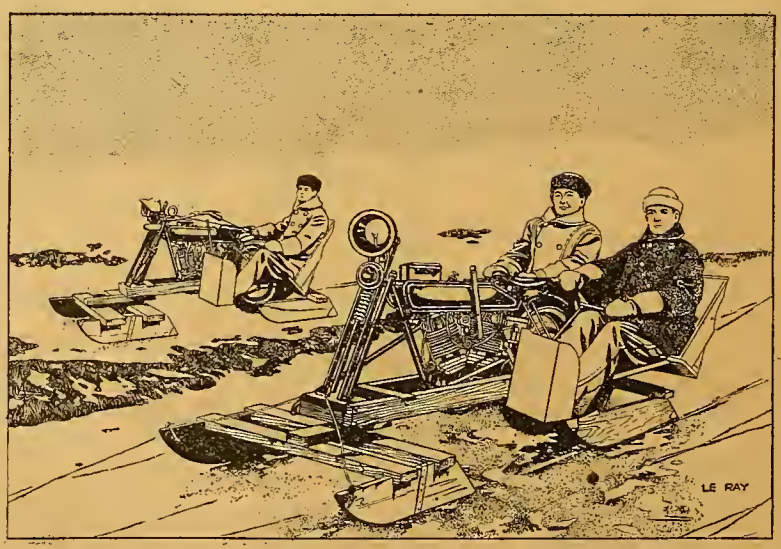
"I ain't never loved but one girl," says Panhandle. "She stuck to me faithfully ten years, and when she died, after eating a chunk of poison, she licked my hand and wagged her tail. That's better'n all your women!" . . .

There were other stories, of course, and my turn came again, but I was silent. The best I could have told them was something they had witnessed themselves.

* * * * * *

Snow, please! Mr. Comp., daub on plenty of snow. Nothing but snow from skyline to skyline, vaster even than the great deserts of the South, immeasurably vast, inconceivably vast, and unspeakably desolate. The spruces are snow-laden, and now and then one of them half a mile away snaps like a pistol shot. The party on the ice turn instantly, for the smallest of sounds becomes great in a silence so vast and tangible as this.

Our own voices do not break the silence. It is too



"This is a new institution in the North country, and one which is gaining in popularity—the motor cycle sled.

Northern Lights.—

profound, too impenetrable. They merely accentuate it, for this is Christmas under Northern skies.

Spring will come some day, rushing savagely across a glaring sky—spring, with its mud and its damp and its flies. The vast icefields will boom and crash asunder; millions of tons of ice, piled mountain high, will grind pack after pack out of the creeks and rivers and into the sea. The southern prairies have their glare and desolation, but in the vastness of this great white world there is an immeasurable something which crushes a man into the innermost recesses of his own soul, like no other land in existence, save possibly the South Pole.

A Real Sport.

But the party on the ice is by no means crushed. A dozen long, narrow sledges are arrayed in line. Each carries aboard a motor cycle, complete save for its front wheel. The rear wheel in one or two cases has been removed, for one can supply whatever method one likes for the purpose of propelling the vehicle over the snow and ice. This is a new institution in the North country and one which is gaining in popularity—the motor cycle sled race.

At sunrise we are off, each with his passenger. Two hours later we switch on our dynamos because it is night again. Accumulators have been discarded as unnecessary weight. Our single headlamp is equipped with a bulb which will stand any voltage that the dynamo in direct circuit is likely to generate.

The going at first is deadly. Over most of it we cannot make 5 m.p.h., and that only at the price of repeatedly pushing and hauling. We are outside as often as in. The exhaust pipe glows a dull red in spite of the intense cold—cold so intense that our controls are wrapped with wool, for to touch naked metal with the naked hand would flay the skin like a glowing coal.

Intense Cold.

So we sweat through our sweaters, and the sweat without cakes into solid ice. The very breath freezes as it leaves our lips, to rim the parki hood with sparkling jewels. It is brilliantly moonlight now, and the party which saw us off will be waiting bright and early when sunrise comes again, unless, of course, blizzard renders a finish impossible.

The procession is straggled out during the first 20 miles, and when at last we stop to refill with gasolene the aurora is rustling overhead, like silken banners. We listen for the sound of a neighbour's engine, but there comes to our ears only the distant howling of wolves ranging for game. A long, thin,

"It is Christmas. Ruddy faces brighten and glow like burnished copper in the ruddy light."

Northern Lights.—

wavering cry it is, indescribably melancholy, soft yet sinister, seeming to float through the whole heavens as though a part of the bitter cold, which in turn is a part of the silence.

Soon we are under way again, and the night air sings in our ears as we seek out mile after mile of wind-swept ice. Up to the Lake of the Little Trees, the complete circuit of which has to be made, following the trail of the dog sled sent ahead to mark out the route. Here and there is a square of black cardboard supported on a cleft stick standing upright in the snow. At one place we pass the complete backbone of a deer, cleanly picked by the wolves, stuck up as a sign-post by some traveller, the nose of the skull pointing in the direction he wished to indicate. In a trial of this kind there is no diverting from the route without being discovered by the observers in the rear, for the snow tells its story, each sled leaving the distinctive marks of its runners.

Winning Through.

So twenty hours go by, when suddenly we overtake the marker with his team of malamutes, the only living soul seen so far. He yells and cheers lustily, eagerly urging his dogs in our wake, anxious to finish not far behind the winners. In the end there are only two finishers. The rest have packed up on the way from one cause or another. They drift in days or may be weeks later, having spent the interval caribou hunting.

It is no small affair being a finisher in a sporting event under Northern skies, for Jupiter and Venus drink side by side from the flowing bowl along with bearded dog drivers from the Hudson Bay, forest rangers from the Rainy River, half-breeds from the Athabasca trails, men who count distance not by the mile, but by the hundred miles. Men who would think less of setting out a thousand miles on foot than you and I would of tramping fifty, men whose map is printed in the heavens and who pride themselves on the achievement of manly things in a country made for men.

Yes, here, too, is the same old romantic, wonderful world. Here, where the power to live and to keep alive is all that counts, where the blow-holes and the rotten ice and the wolf packs are one's hourly foes, where heritage is nothing and great possessions less.

Drama.

Here where fortunes change hands in a night, vast sums, tens of thousands, from one ragged adventurer to another under the glare of the flaming arcs. So the stranger watches wide-eyed, watches that grotesque drama of humanity, naked and unashamed, seething about the centres of its gambling hells and drinking halls. But strong fingers close upon one's forearm, and a voice, husky by long unfamiliarity with speech, growls out, "Don't believe it, boy. I've lived here thirty years, and I know. I'm one of the old sour-doughs who packed in from the White Horse Pass, so take the straight tip from me. The women are hell, and the liquor is worse. There ain't no romance about it, so quit before it gets you down!"

True, very true, bearded stranger, but above the clash of that jazz band, beyond the faro tables, there sound the Pipes of Pan.

* * * * * *

But what does it matter?—Peering thus down the Milky-way with its dancing satellites, jazzing to the world-old tune, which is sweet or sad or harsh or soft as we choose to make it—what does it matter when at 7 a.m. each morning one is wakened by a little Milky way of one's own, seated astride one's manly chest and bumping up and down; and when a soft voice in one's ear gently pleads, 'Daddy, dear, do play at Brough Superiors with me. I'se been waiting to make a motor cycle of you since 6 o'clock."

Change.

How things change, and how very far away stands the schoolgirl and the syren of the *café*. I suppose the old scene shifters will go on with their work, pulling down castles, building new ones, piling up mountains, crushing the ice of winter seawards, and so on for just so long. But though they do their worst, may the utterance of the *blasé* fool never break from the lips of those who try to use what little wisdom may be theirs—that there is no romance in life!

INTERNATIONAL MOTOR CONFERENCE.

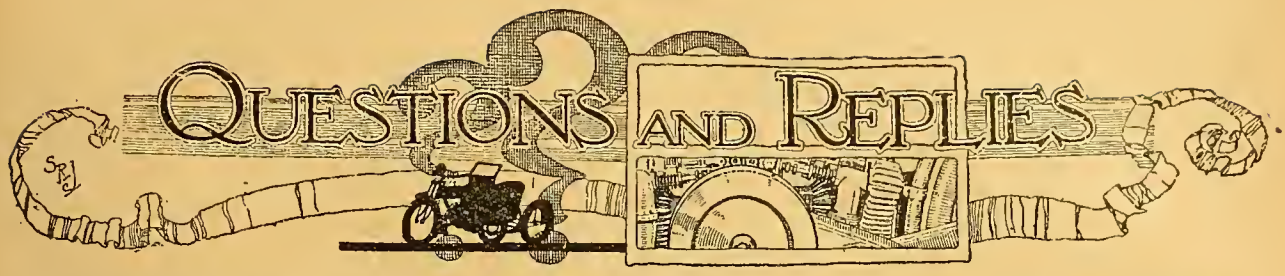
Proposal for Universal Danger Signal. Control of Cycle Cars Reserved to Recognised Car Organisations.

SOME items of interest to motor cyclists arose at the recent conference in London of the International Association of Recognised Automobile Clubs.

On the proposal of the Italian Club, Austria was admitted to the conference, and it is proposed to admit Germany at a later date. These two countries are at present excluded from the International Federation of Motor Cycle Clubs.

The Automobile Clubs of Denmark, Finland, Norway, and Sweden brought forward a proposition for a universal danger signal; it was adopted, although the conference realised that it would take a considerable time before people would abandon their present systems.

As announced in our last issue, the conference adopted the resolution put forward by the Royal Automobile Club that all pleasure motor vehicles of four wheels (including cycle cars) should come under the jurisdiction of the recognised automobile clubs. Three-wheeled cycle cars will, of course, be looked after by the motor cycling bodies. This ruling takes away all possibility of the A.C.U. controlling small four-wheelers in this country.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 1½d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the top left-hand corner of the envelope, and should be kept distinct from questions bearing on technical subjects.

ROUTES.—By special arrangement with the Automobile Association and Motor Union, readers of "The Motor Cycle" desiring routes may enjoy the benefit of the Road Service Department of that organisation. Queries should be addressed to the Editor in the ordinary way (enclosing a 1½d. stamp), and will be dealt with by the A.A. and M.U., who are regularly in receipt of reports from their representatives all over the country as to the existing state of the roads in any particular locality.

LAP DISTANCE AT BROOKLANDS.

(1.) What is the distance of a Brooklands lap? (2.) Who are the owners of Herne Hill racing track, and also what is the address of the owner of Canning Town track?—S.J.

(1.) The distance of one lap at Brooklands Track is 2 miles 1,263 yards. (2.) Herne Hill track is owned by the London County Athletic Club, Burbage Road, Herne Hill, London, S.E., but Canning Town track is no longer in existence.

REMOVING ZENITH BACK WHEEL.

I have been overhauling my machine, a Zenith-Gradua, and cannot get the back wheel, nor the sliding plungers which carry it, out of the frame. What is the best way to get it out?—G.D.A.

You do not give the date of your machine, but if, as may be expected, it is of later manufacture than 1912, the plungers carry the fork ends, and the wheel may be removed by loosening the two axle nuts. If the machine is of 1911 date or earlier, however, the plungers themselves must be removed, as they are screwed on to the axle. Everything in the way of the wheel should be removed, such as mudguard stays, etc., and the caps at the rear ends of the forks taken off, and then the gear should be completely unscrewed beyond its lowest position until the plunger threads are free and the wheel can be withdrawn.

A FOUR-CYLINDER F.N.

(1.) Can I obtain jets for the *breveté* single lever carburetter which is fitted to my F.N. four-cylinder? How does one adjust it to run slowly? It will hardly fire below 10 m.p.h. (2.) Is there any special setting of the valves? The exhaust is set to close as the piston reaches the top of the stroke. What lift should the a.o.i.v. have? (3.) And, lastly, what is the maker's name, and what do the letters F.N. mean?—F.N.

(1.) The word *breveté* merely means patented. We presume the carburetter in question is an F.N. Successful adjustment of the automatic inlet valves and carburetter is the secret of slow running. All air leaks should be eliminated from the induction system. The inlet valve springs should not be too strong if very easy starting is required. (2.) Your idea of setting the exhaust valve is correct, and the inlet valves should have an opening of about $\frac{3}{32}$in. (3.) The machine was manufactured by the Fabrique Nationale d'Armes de Guerre (National Manufactory of Arms), of Liège, hence the initials F.N.

Important Dates.

Tues., Dec. 26th and Wed., Dec. 27th—M.C.C. London-Exeter Run.
Fri., Jan. 5th to Wed., Jan. 24th—Italian Motor Cycle Show
Sat., Jan. 13th to Wed., Jan. 24th—The Belgian Salon.
Fri., Jan. 26th to Sat., Feb. 3rd—Scottish Motor Show.
Sat., Feb. 24th—Colmore Cup Trial.
Wed., March 14th—A.C.U. Stock Machine Trial.
Sat., Mar. 17th—Victory Cup Trial.
Fri., Mar. 30th and Sat., Mar. 31st—M.C.C. London-Land's End Run.

Mon., June 11th—Junior T.T. Race.
Wed., June 13th—Lightweight T.T Race and Sidecar T.T. Race.
Fri., June 15th—Senior T.T. Race.
Sat., July 21st—B.M.C.R.C. 500 Miles Race.

SMALL CAR PROGRESSION

"THE AUTOCAR"—published from the offices of "THE MOTOR CYCLE" and conducted on the same enterprising lines—is the complete automobile journal embracing small, medium, and large cars. Every motor cyclist contemplating the purchase of a light car should read

The Autocar

Every Friday **4d.**

Founded in 1895, "THE AUTOCAR" is the largest and most successful automobile paper and enjoys the greatest circulation. It is universally accepted as the representative British motoring journal.

CONVERTING A LIGHTING-IGNITION UNIT.

Is a single cylinder Maglita machine (of the heavy type) suitable for three lights, electric horn and ignition? At present it is running at engine speed and giving two sparks, one at firing stroke the other at exhaust. Is it possible to convert this machine for use with a twin-cylinder engine? Presumably I shall have to replace the present cam-ring with one having two cams, but do not understand how I can tap the high tension winding to obtain two sparks in the four strokes.—J.S.

The Maglita can only be used for twin cylinder engines with cylinders set at 180 degrees. It still must run at engine speed and only one high tension lead is taken out from the winding, this is led to a distributor fixed on the contact breaker end of the armature spindle and the two wires to the plugs are led from the distributor cap. If it is for a flat twin that you wish to convert it the makers would supply all the necessary parts and you should not have any great difficulty in fitting them.

INVOLVED RESPONSIBILITIES.

While riding a sidecar outfit which was forwarded to me by a garage for inspection and trial under trade numbers I was stopped by the police, who noted that the trade plates had not the licence in the triangle provided for that purpose (the garage proprietor had the licence in his possession), that the front brake had one block missing, but was otherwise fairly effective, that my licence had expired two days, and that the machine had an old private licence expired December 31st, 1921 (which should have been returned) in the holder. What is my position?—A.D.

As the machine was presumably the property of the garage owners who supplied it to you for trial, the responsibility for the illegally used trade numbers and the defective brake should be theirs, although, of course, you would in part be responsible for taking it on the road in a condition which did not comply with the law. The fact that your licence had expired is your own responsibility, of course, and the police will be in order if they summon you on this ground. It was the duty of the last owner to return the expired licence.

EXPERIENCES WANTED.

Readers' replies to questions published under this heading should be addressed c/o The Editor, "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4, when they will be forwarded direct to the querists concerned. Requests for experiences should be accompanied by a stamp.

"R.A.M." (Crawley).—349 c.c. sports A.J.S., 490 c.c. Norton, 490 c.c. o.h.v. Norton, and 496 c.c. B.S.A.

"T.S.L." (Treffgarne).—499 c.c. Triumph or 490 c.c. Norton: suitability for rough roads.

"F.F." (South Woodford).—211 c.c. Sirrah, 245 c.c. Calthorpe.

"A.P.L." (N. Kensington).—211 c.c. Levis ("Popular" model 1920 and 1921): weight with usual equipment.

"J.H." (Durham).—550 c.c. Triumph, 700 c.c. B.S.A., 678 c.c. Martinsyde, and 796 c.c. Ariel sidecars: occasional solo use; strength of frame and sidecar connections.

"G.W.R." (Leith).—550 c.c. Triumph: comfort and suitability for middle-aged rider.

"J.L." (Preston).—Binks three-jet carburetter on 976 c.c. Royal Enfield.

"E.R.W." (Headingley). — 292 c.c. Hawker: automatic lubrication.

"N.A.V." (Wrexham).—486 c.c. Scott Squirrel (1922 model): stability on tramlines and stone setts.

"T.T." (Warwick).—Old 499 c.c. B.S.A. engine: tuning for speed and fitting of Ricardo piston.

"P.H.S." (Bridport).—370 c.c. Connaught sidecar, 349 c.c. A.J.S. sidecar, 398 c.c. Raleigh sidecar, 348 c.c. Ivy sidecar, and 292 c.c. O.K. sidecar.

"W.H.B." (Manchester). — F.E.W. valve attachments on 550 c.c. Triumph.

"J.B.S." (Horbury).—650 c.c. Zenith (sports model): belt wear.

SPARKLETS

Admiralty Contract.

A contract for the well-known Kaye's serrated steel oil cans has been effected with the Admiralty.

Price Reduction.

The price of the 545 c.c. Hawker sidecar outfit has been reduced from £105 to £99 15s.

For Christmas.

Several clever little tricks can be effected with five playing cards which may be had from the Leicester Rubber Co., Ltd., Post Office Place, Leicester.

Guarding Against Punctures.

A machine on which Jackson's Impervo is to be standardised is the Morgan. The inner tube on the wheel will be filled with this puncture sealing compound.

Lost.

Near Kirriemuir, an acetylene lamp loaned to rider of a New Gerrard travelling to Montrose, and not returned. Ref. 118.

The Toronto Fair.

On previous occasions the major portion of the goods exhibited at the Toronto Fair have been of Canadian or American origin, and this is to be regretted, as the participation of English firms should be much greater on account of the opportunities for British business in Canada which exist. Information concerning the Toronto Fair can be obtained from the Federation of British Industries, 39, St. James' Street, London, S.W.1.

Christmas Holiday Motoring.

On Christmas Day there will be no A.A. road patrols on duty, but during the rest of the holiday season they will be at their posts in full strength.

Toolmaking Instruction.

Those preparing for the manufacturing side of the motor trade may be glad to know that the Polytechnic Education Department, 309, Regent Street, London, W.1, has a class for instruction in jig and tool design.

Another Proprietary Flat-twin.

Up to the present, proprietary engine makers have confined themselves in the smaller sizes to singles and V twins. A flat-twin Bradshaw engine of 494 c.c. is now marketed by James Walmsley and Co., Ltd., of Preston, which should be eminently suitable for sports models.

Diary for Motorists.

Included in the well-known series of Charles Letts' specialised diaries is a new one for the motorist, published jointly by Charles Letts and Co. and the A.A. (price 2s.). It contains much useful information, and, with tabular spaces for running costs, forms a very complete motorist's log-book.

More 1923 Prices.

To our classified list of motor cycles must be added the 538 c.c. Stanger two-stroke, the prices for which are as follows:—Spring frame (all-chain drive), £99 9s.; (chain-cum-belt drive), £88 4s.; rigid frame (all-chain drive), £90 6s.; (chain-cum-belt), £85 1s. Sidecar, £21 extra.

Catalogues Received.

Martinsyde Ltd., Maybury Hill, Woking, Surrey.—1923 Martinsyde catalogue.

Trump Motors, Ltd., Foxlake Works, Byfleet, Surrey.—List of Trump motor bicycles.

Douglas Motors, Ltd., Kingswood, Bristol.—Catalogue of the Douglas flat-twins, also three folders relating to Douglas record and racing performances.

Grindlay (Coventry), Ltd., Melbourne Works, Coventry.—Folder giving particulars and prices of Grindlay sidecars and sidecar screens, luggage carriers, and hoods.

HOW THEY ADVERTISE IN AMERICA.

A sign that gives a brief history of the district in addition to serving its purpose as an advertisement. The page on the left says that in 1853 Lieut. R. S. Williamson, on investigating the feasibility of railroad routes to the coast, entered the Colorado desert through San Gorgonio Pass, the first stop being at Palm Springs. In Great Britain there is strong prejudice against obtrusive advertisements in places of natural beauty.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words 3/-, and 3d. for every additional word. Paragraphs of under 8 words are charged double rate. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable to ILIFFE & SONS Ltd., and crossed & Co. Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle" by the first post on Friday morning previous to the day of issue. Advertisements that arrive too late for a particular issue or that are crowded out will automatically be inserted in the following issue unless accompanied by instructions to the contrary.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box ooo, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. ooo, c/o "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4. *Readers who reply to Box No. advertisements are warned against sending remittance through the post except in registered envelopes; in all such cases the use of the Deposit System is recommended, and the envelope should be clearly marked "Deposit Department."*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the machine offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor. Carriage is to be paid by the buyer, but in the event of no sale each party pays carriage one way. The seller takes the risk of damage in transit. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, 1%. All deposit matters are dealt with at Dorset House, Tudor Street, London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

A.B.C.

£46.—1920 T.T. A.B.C., very fast, recently overhauled Sopwiths, lamps, Klaxon, Watford, tools, spares, etc., perfect throughout; bargain.—Rae, 88, Fitzjohns Av., Hampstead. (D) [5701

The Sign of G Good Service

A Real Good Time
to You and Yours
This Christmas

May Yule logs blaze upon your hearth and in the glowing embers of your fire may you see many pleasant pictures of the coming 1923 Season.

Have you realised what a wonderful year 1923 will be for Motor Cyclists?

Prices reduced to zero and stabilised for the season, the certainty of better and wider roads, and the prospect of cheaper petrol and lighter taxation.

All these pleasant pictures stand out bright and clear this Christmas with just one flickering warning "Tempus Fugit." Time flies, so to avoid disappointment place your order now.

To all Fellow Motor Cyclists
A Merry Christmas
and a
Prosperous New Year

With our sincere thanks to all those good friends of ours both at home and overseas for their continued support.

It was their support and recommendations that first inspired that old slogan of ours:—

"Our sales increase our friends,
Our friends increase our sales,"

and which will continue to be the inspiration of Godfrey's service to all their customers during the coming year.

GODFREY'S Ltd.
208, GT. PORTLAND ST., LONDON, W.1.

Matador.

MATADORS are creating a sensation by reason of their wonderful value. Don't be left without one for the spring Orders are rolling in daily.

A 2¾h.p. o.h.v. Bradshaw engined machine that can do 60 miles per hour with ease is a machine to be seriously considered. The finish is exceptionally good, the tyres are Dunlop 700×80, the mudguards sensibly wide. Burman 3-speed, clutch, and kick-starter. There is a host of other good points. Come along and see it.

AT £75 they are excellent value.

ALLAN GRUZELIER, Ulster Chambers, 168, Regent St., W.1, know a good thing when they see it! Come and see it too.

A FEW Agencies still open in London, Surrey, Sussex. [4310

Let your XMAS GIFT be a DOUGLAS.

It is always seasonable, always useful, and a constant source of the greatest possible enjoyment. The 2¾ h.p. Douglas fully equipped at £50 is cheaper than pre-war price.

I am a Douglas Specialist and handle nothing but Douglas Motor Cycles. I can therefore give you the best possible service. Cash or terms to suit you. I can supply the special Douglas fitted with Zoom Zoom Exhaust system, Alloy Air Cooled Valve Caps, Aluminium Combined Footboards and Footrests, etc., fully equipped, and GUARANTEED TO DO 55 m.p.h. for £52.

I shall be pleased to send you a copy of the interesting 1923 Douglas Catalogue, and to give you any helpful information and advice you may require.

Here are some more seasonable gifts for motor cyclists.

THE TONY COMBINED ALUMINIUM FOOTBOARD AND FOOTRESTS. Beautifully finished—giving a natural riding position. A real job. Something that lasts for ever. Price 30/- per pair complete.

A beautifully made and reliable **HANDLEBAR WATCH,** fully guaranteed by makers, jewelled movement. This is an excellent lever watch and is supplied complete with waterproof and beautifully finished case to clip on the handlebar for 30/-.

PARALLEL JAW, SELF-ADJUSTING, 6" SPANNER. No milled adjusting nut to worry you. The adjustment is effected by a slight movement of the thumb. Price 2/6

LOW POSITION SADDLE. The front clip is secured to the top frame tube, and the back springs are anchored to the special seat bolt supplied. Gives a much lower riding position, and therefore greater security on greasy roads. Price complete, 25/-

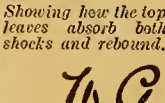
ZOOM! ZOOM!! The popular Exhaust System. Beautifully made, finished in burnished nickel or copper. A pleasant Zooming note without back pressure. Adds pounds to the appearance of any Douglas. Price 30/- in copper finish, 33/6 nickel.

LEATHER TOOL ROLL. A real heavy affair that will stand rough usage. Fitted with leather pocket, two side flaps, leather centre tool holder and leather strap. 5/- each.

You will appreciate this convenience for 4 h.p. Models. A funnel, Oil Filler, and Crankcase, Compression Reducer combined. Neat and out of the way of dirt. You can get the last drop out of a can without soiling your hands; fitted in a jiff. Price only 10/6.

The Spring in its normal position.

The Spring heavily loaded. Movement 4 inches.



Showing how the top leaves absorb both shocks and rebound.

UNBREAKABLE SIDECAR SPRING. GUARANTEED FOR 12 MONTHS.

Double the comfort. Actual photographs reproduced showing the wonderful 4 in. movement of the spring. You can practically turn this spring inside out, and it will return to its normal setting without fracture. its secret is in its self-shock-absorbing qualities, and it works both ways, thus taking the rebound, which is also absorbed by friction. Have one fitted to your chassis, and you'll be surprised at the added comfort. Price 17/6.

HOODS, WINDSCREENS, ETC.

ALL prospective purchasers of Easting windscreens should buy from the recognised agents only.

BEWARE of spurious imitations! None are genuine unless bearing the name Easting.

COMFY always. All ways is our slogan, and every Easting lives up to this motto.

DON'T be 1d. wise and £ foolish. All materials used in Easting windscreens are of the finest qualities obtainable.

EASTING is a recognised trade-mark. Anyone using same for the passing of spurious goods will be prosecuted.

FOOLS will part with their money if they think they can get genuine articles at Pirate prices. Buy Eastings.

GOOD articles well made always give unbounded satisfaction, hence the popularity of Eastings.

HAVE you got the latest Easting catalogue? It fully describes the full range of sidecar screens and handle-bar screens.

IMITATION is the sincerest form of flattery, but don't get misguided; buy Eastings only.

JUST another reminder.—Easting prices have been reduced again.—Write for catalogue to Easting Windscreens, Ltd., 132, Steelhouse Lane, Birmingham [5089

IGNITION, LIGHTING, ETC.

AN Amazing Offer.

COUNTY of London Engineering Works, Ltd.

WE hold the largest and most varied stock of magnetos and spare parts in England. Our stock comprises over 30,000 magnetos, and an inside estimate of our spares is £250,000. We would bring to your notice that these magnetos are not old disused magnetos painted on the outside to look like new, like many being offered to the public like so-called magneto specialists and experts, but are new unused Government surplus, and every magneto, previous to being sold, is thoroughly overhauled and subjected to the same test as by the makers.

GUARANTEE.—These magnetos are all fully guaranteed for 12 months against all defects, and should any magneto at any time within this period prove in any way defective, we will willingly replace or repair same free of charge. Approval.—Notice, all goods sent on approval for 14 days per return of post on receipt of cash, and in the unlikely event of these goods not meeting with your entire satisfaction, we will refund cash in full, making no deductions for packing or carriage. Magnetos despatched through this paper's deposit system if required.

BOSCH ZA1 and ZA2; £4/10.

BOSCH ZE1, ZE2 and ZEV, all degrees; £5.

BOSCH ZU1 and ZU2; £6.

BOSCH DU2, open type; £4/10.

THOMSON-BENNETT AM1, AM2, and AMV, all degrees; £2/15.

THOMSON-BENNETT AC1, AC2, and ACV, all degrees; £3/10.

THOMSON-BENNETT ASC2, for 180° 2-stroke; £4.

THOMSON-BENNETT AD2; £3/10.

C.A.V., Type 3U1. This magneto can also be supplied with Rudge spindle; £3.

C.A.V., Type 3U2; £3.

C.A.V. KU1 and KU2 pattern; £2/10.

E.I.C., Type A1, A2, and AV 2, all degrees; £3.

M-L, Type PM1; £3/5.

EISEMANN WGD2, 180°; £4/18.

MEA, Type M1; £4/15.

HECO BX2, 180°, with dist. board; £3/15.

SPLITDORF EU1 and EU2; £2/5.

SPLITDORF EUV, all degrees; £2/10.

DIXIE M20/21 and M1; £2.

BERLING N11 Single-cyl.; £2.

THESE Magnetos are all enclosed waterproof and variable ignition unless otherwise specified.

REPAIRS.—Magnetos, starters, and dynamos.

IF you have one of these for repair, save money and send it to us for an estimate. Remember, we hold the largest stock of magnetos and spare parts in Great Britain, and have one of the finest workshops fitted with the most modern appliances, especially for this type of work. All repairs guaranteed for 12 months.

SEND your next repair to us; it will pay you.

COUNTY of London Engineering Works, Ltd., 27, Stockwell Rd., S.W.9. Tel.: Brixton 2841. T.A.: Ignitionac, Claproad, London. [5440

DYNAMOS with enclosed cut-out, 4 to 6-volt, 4 to 6 amps., approximately, speed 1,500 r.p.m., well made, 50/-; pounds below production cost, carriage extra.—Acton Motor Exchange, 55, Churchfield Rd., Acton, W.3. [5602

LIGHTING Sets.—Stupendous offer, comprising P and H. No. 132 electric head lamp, tail lamp, bulbs, also 4-volt 40-amp. accumulator in metal case, with clips, switch, and wire, complete; £3/16/6.—Universal Motors, St. James Rd., Derby. [3868

EUSTON Ignition Co., sole representative for the Splitdorf Electrical Co.—Repairs, spares service to Splitdorf magnetos, dynamos, Dixie magnetos, etc. We have the factory, plant and experience. Official Indian electrical service station. Thomson-Bennett repairs and spares; spares and repairs to all makes of magnetos; all repairs are tested on an approved A.I.D. test bench before dispatch, and carry our guarantee for 12 months. We hold the largest stock of guaranteed magnetos in London Twins, all degrees, charged accumulators, all voltages always ready. We stock everything electrical for the motorist. We give you real live service always.—Euston Ignition Co., 329, Euston Rd., N.W.1. 'Phone: Museum 5034. T.A.: Magdyno, Euston, London. [0263

Sittingbourne, Kent.
August 17, 1922.

Mr. Brodrick,
The South-Western Appliance Co.

Dear Sir,

The St. Helier Building arrived on Saturday, two days before promise of delivery, and we are more than satisfied with it.

We erected it on Wednesday and it went together like clockwork. I am very pleased we left the order with you, as all who have seen it think the value is remarkable and admire the artistic appearance. Trusting and believing it will get you further orders from this district.

Yours faithfully,
THOS. E. KENNETT.

RELIANCE Magneto Repairing Co.

RELIANCE for Repairs, new magnetos, and spare parts of every description.

RELIANCE have the largest and most up-to-date repair factory in London or Provinces

RELIANCE carry out all repairs on the premises, including armature winding. Trade inquiries solicited.

RELIANCE have one of the most modern armature-winding plants and test rooms in the country, and can therefore offer you the following advantages:—

TIME.—All work within 6 to 48 hours, and a solid 12 months' guarantee in writing to back it up.

CHARGES.—No flat rates. You are charged according to the work that is required; therefore you are not in some cases helping to pay for other people's repairs.

OUR Offer.—We shall be pleased to allow you to see your magneto on test after repair at our works. How many others can make the same offer?

RELIANCE have the following magnetos in stock, all fully guaranteed and on approval.

THOMSON-BENNETT.—Singles and twins, new, any degree, waterproof, variable, suit any engine; price 55/-.

C.A.V. Singles and Twins, new, ideal for any light-weight, 2½h.p. and 4h.p. Douglas; 55/-.

BOSCH, Type Z.A.2, second-hand, enclosed, waterproof, variable, latest pattern, for Douglas 2½h.p and 4h.p.; £4/10.

ACCUMULATORS, best makes only, for all purposes, any voltage, charged and uncharged, always in stock; send for prices.

BOSCH Enclosed, waterproof, type D.A.L. magnetos, Government surplus, any degree, ready to fit on Indian, Harley, J.A.P., or any big single or twin. We guarantee these to give you slow running and easy starting, and they are in every way ideal for the big machine; price, carriage paid, £4/10

GUARANTEE.—Every magneto, no matter what the price or make, is guaranteed by us. Not merely that same is in good order at time of sale, but a plainly written statement that we guarantee each machine against all defects for a period of 12 months. This, we maintain, justifies us in charging a few shillings more than certain of our competitors. List sent post free upon application.

RELIANCE were established in 1914, since when we have enjoyed a reputation which is second to none for straight and fair dealing.

TANKS Made or Repaired, re-enamelled, lined, transferred, handle-bars, etc., plated; estd. 30 years.—Attwoods, 25, Pentonville Rd., London, N.1. [9451

COVENTRY Tankers, Ltd., makers to the principal manufacturers; petrol tanks for any style supplied extra capacity.—Hearsall Works, Coventry. [3239

TANKS re-enamelled to pattern, high-class work only; 16/6; special terms to trade.—Jenkins and Sons, Richard St., Atkinson St., Deansgate, Manchester. Established 25 years. [1027

AVERY'S Make and Stock Tanks to suit machines of most the leading manufacturers, with plated fittings complete, at 35/-; guarantee for 12 months with every tank supplied.—Gordon St. Tank Works, Coventry. 'Phone: 1774. [0896

TANKS of every description replaced, repaired, and re-enamelled at our own works; all kinds of fittings stocked; quick service and reasonable charges. Illustrated list free.—A. Green, Water St., Chapel St., Salford, Manchester. Tel.: 2191 Central. [0256

TANKS, all makers, latest improved designs, supplied, old tanks in part payment, partition leakage, fastenings, and every repair undertaken, re-enamelling, makers' latest colours and designs guaranteed.—Park Tank Works, 1A, Paradise Rd., Highbury, N.5. [3854

MANUFACTURERS and Enamellers.—Old tanks overhauled, repaired, and re-enamelled equal to new, complete, 27/6; tested under pressure; new tanks, any make, made by experts; satisfaction guaranteed.—Green Bros., 19A, Teneriffe St., Gt. Clowes St., opp. Broughton Baths, Manchester. 'Phone: 727 Hr. Broughton. [2709

BELTS.

BALATA and Chrome Belts for winter use; ¾in., 1/4; ⅞in., 1/6; 1in., 1/9; 1½in., 2/- per ft.; fasteners, 9d. each; postage 1/-.—Sole Manufacturers, W. Pollin and Son, Hollington, St. Leonards-on-Sea. [2987

CHEAPEST way to buy your belt, and genuine guaranteed material. Dunlop, Avon, and Pedley, cut as required, 1¼in. 2/-, 1in. 1/9, ⅞in. 1/5, ¾in. 1/4 per foot; John Bull, 7ft. 6in. lengths, 1½in., 16/-; ⅞in. 12/6; hook fasteners, 1/4.—Maude Rubber Co., 58, Praed St., W. [4896

BELTS.—Clincher clearance, not W.D., ¾in., 6ft. 6in., 8/2; 7ft. 6in., 9/5; ⅞in. 7ft. 6in., 9/5; 8ft., 10/1; 8ft. 6in., 10/9; 1in., 7ft. 6in., 10/4; 8ft., 11/-; 8ft. 6in., 11/8; 1⅛in., 8ft., 16/-; Bates short lengths, ¾in., 5ft. 6in., 5/-; ⅞in., 5ft., 5/6; leather belts, ¾in., at 1/6 per ft.; Belt fasteners, 9d. and 1/-. Post 1/-.—The Bancroftian Co., 64 and 78, Bishopsgate, E.C. [0933

CARBIDE.

CARBIDE, guaranteed highest grade, lowest price; immediate delivery nearest depot.—Write, Jackson and Co., High St., Chesham, Bucks. [5185

CARBIDE, highest grade Norwegian, 18/6 cwt., 11/6 ½-cwt., immediate delivery; 1 lb. decorated tins, empty, 17/- gross.—Kemp's Garage, Importers, Louth. [5081

CARBIDE, finest quality, ½in., 19/6; larger meshes, 18/6 cwt., f.o.r. nearest depot; coated, 25/-, ex Bristol only.—Hedge and Co. Warwick Rd., Bristol. [4681

CARBIDE, finest quality, giving 100 per cent. pure gas yield, all sizes; cwt. 21/-, ½-cwt. 12/6, 28 lb. 7/6, drums free. (Depots in all parts.) 1 lb. carbide tins 17/6 gross. Hundreds testimonials. Established over 30 years.—Young, Importers, Misterton, Somerset. [3511

PATENT AGENTS.

J. E. S. LOCKWOOD, 3, New St., Birmingham. 'Phone: 5816 C. Patents guide free. [4808

PATENTS Advice, handbook free.—King, Registered Patent Agent, 146a, Queen Victoria St., E.C. 35 years' references. [0129

W. BRYSON, B.Sc., Assoc.M.Inst.C.E., Chartered Patent Agent, 29, Southampton Buildings, London, W.C.2. 'Phone: Holborn 672. [7917

PATENTS, EXPERIMENTAL WORK, ETC.

VERY Promising Motor Cycle Accessories.—Box 5158, c/o *The Motor Cycle.* [5686

EXPERIMENTAL Work.—My tool room, engineering works, drawing office, and laboratory are devoted entirely to experimental engineering; secrecy guaranteed.—Leopold Wurd, B.Sc., A.C.G.I., Harmood Place, Chalk Farm, N.W.1. 'Phone: Hampstead 7559. [0943

The Popular Sidecar.

JUST prior to the car and motor cycle shows, it will be recalled that many expressions of opinion appeared in the daily press foretelling the early demise of the sidecar. *The Motor Cycle* energetically controverted these views for the benefit of the uninitiated, recalling that similar views had been put forward year after year by persons interested in or over-enthusiastic concerning the small car.

The curious part is that those who are loudest in their criticism of the sidecar are in the main people who never drive one and know nothing of its capabilities. As we have often urged, there would be little need for sidecars if cars were as cheap, both in first cost and running cost, as the more economical three-wheeler. But we must face facts as they are and not as one might like them to be. The first important trial since the Show took place this week, and what do we find? There were no less than 93 sidecar outfits and 14 three-wheeled runabouts in what is generally regarded as the most difficult trial (excepting freak events) of the year, namely the M.C.C.'s 24-hour run from London to Exeter and back. This number, of course, considerably exceeds the number of small cars in the trial, and in fact exceeds, by one, the total number of solo motor cycles engaged.

The would-be prophets seem to have been silenced of late, but it is not without interest to recall their ill-advised comments concerning sidecar machines. Notwithstanding the assertions of the critics, the sidecar remains one of the most popular types of vehicle on the road, thanks to its extraordinary carrying capacity, and its economy as compared with the small car, in the matter of taxes, tyre wear, garage charges, petrol consumption, and indeed all expenses that form the main items in the annual running cost account.

Next week we shall analyse the results of the strenuous trial mentioned and have no fear of the good showing which the reliable sidecar will put up, as compared with other forms of light transport.

Comfort for the Sidecar Passenger.

THE comfort of the sidecar passenger is to-day closely studied by sidecar manufacturers. An examination of the many admirable designs of hoods and screens reviewed of late in these columns proves the statement, and a superficial survey of completely equipped sidecars of modern production almost leads one to believe that perfection has been reached. But this is hardly so.

The hall mark of experience is clearly apparent in many types, since certain designers have really endeavoured by their own practical experience to eliminate weaknesses and faults. But there is room for improvement in detail refinements which add so much to the comfort of the lady passenger in particular. The matter of body width, the quality of the upholstery, the amount of leg room and the convenient, or otherwise, disposition and dimensions of the door are points that still demand attention.

One or two models are, of course, notable exceptions, capable of comparison in finish and comfort with the best light cars. The feeling, however, gains currency that too many manufacturers have concentrated on the sporting type sidecar to the partial neglect of the touring pattern. No doubt the fashionable streamline designs are effective in appearance, but it must be remembered that the bulk of sidecar passengers prefer comfort to elegance, and it is possible that the streamlining of bodies may be carried so far as to prove a detriment to the development of the touring or family sidecar, instead of a stimulant as it is intended.

An index to the advertisements in this issue will be found on page ii of supplement.

Secrets of Track Tune.

FROM time to time *The Motor Cycle* publishes articles on tuning up engines for speed. The authors' directions are generally sufficiently advanced to enable a reader to win some local club event, in which he does not run up against a factory expert on a "works 'bus"; but they are quite inadequate to furnish a short cut to a first at Brooklands or to endow the user with the power to press George Dance hard in an open event. When such articles appear I occasionally get a querulous letter from some disappointed speed man, who has ambitions to levack, and is annoyed because we don't offer him sufficient help. There are two main reasons for our failure. The first is that every make and type of engine requires individual treatment. The second is in the rare cases where we happen to know how the champion in a given class gets his extra m.p.h., and we are pledged not to tell.

A Speedman in a Talkative Mood.

I WILL, however, tardily betray one "secret of tune," which was responsible for some smashing victories a little while ago, and concerning which my lips are now tardily unsealed. A certain aspirant to record honours was a sound technician, and knew exactly what his engine had got to do in order to register the desired figures. He worked out on paper the necessary data, translated certain of them into a camshaft of the indicated type, went down to Brooklands, and completely failed to obtain the expected results. Puzzled, he returned to his drawing office, checked his data, plotted the camshaft afresh, compared the drawings with the steel, and arrived at no solution. Finally, in bewilderment, he returned to Brooklands with several soft camshafts, carburised them mildly, and did two or three laps on each. Then he examined the damaged cam surfaces, and discovered by the markings that they failed to produce on the track the valve openings which he required. Valve bouncing had nullified his elaborate preparations.

Perseverance Rewarded.

HE stuck at the job until at last he got the valves to behave in the engine as his original calculations had required. But by this time he had departed very far indeed from the original drawings, which had been vitiated by the fallacious supposition that tappets would always cling to the cams like gum to a stamp, that valve springs would function uniformly, and that a valve once restored to its seating would stop there till the tappet flew up once more. He duly got all the intended records, and then some, as the poets say; but he states that the work occupied no less than 200 hours on the track.

Another Instance.

TO quote another tale equally based on the sweat and blood of famous men, a little group of track specialists were confounded once upon a time. They had either mutually or individually put all they knew into a certain popular engine, and amassed many secrets of tuning it. They had obtained certain results, which they regarded as the outside edge of the absolute limit. Further they could not go. They were prepared to wager all they were worth that nobody could get any more out of that engine; and they themselves could not risk more than a lap or two without wrecking its filigreed intestines. Judge of their speechless rage when a nonchalant amateur appeared at the track one day with a sister engine, and calmly proceeded to *lap* at an appreciably higher speed than they could fly kilometres at. They had told him, as a representative of their stable, all they knew (well, perhaps *nearly* all). Needless to say, he had no peace at all till he confessed what else he had done. Blushingly he at last admitted that he had made himself a new and thicker cylinder, and within its fat walls the heat, radiating circumferentially, had ceased to pull the barrel out of round.

Once More.

ON yet another occasion a lad—he was in the trade, as it happened—annoyed the factory experts by getting some 3 m.p.h. more out of his sports model than any of the Coventry staff could squeeze. No suspected Hun was shadowed on the East coast in 1914 as tightly as that lad was followed. At last a member of the espionage department spotted the fact that the cylinder head was not standard. The lad, as it chanced, had hit by some side track upon a type of head not unlike those which Mr. Ricardo now turns out; he never knew why it was good, nor did the factory discover the reason when by various foul and nefarious methods they secured a cast of it; but as long as they used it they did well. Now if *The Motor Cycle* could obtain such knowledge when it is red-hot (which we cannot do), with leave to use it (which would never be given), and our readers could spend the necessary time and money (which they couldn't), the entire field at the next local club sprint would be miling in round about 40s. dead. Many would then fall off and be killed. So things are probably best as they are.

"Ixion's" "MOTOR CYCLE REMINISCENCES" are available in book form, price 2s. 9d. post free, from "The Motor Cycle" Offices, Dorset House, Tudor Street, E.C.4.

Occasional Comments.—

Those Sports Models.

SEVERAL buyers enquire how a sports model differs from a touring model so far as the owner's sensations are concerned. The riding position is less of the "sit up and beg" type. The speed and acceleration are superior. If a close ratio gear box is fitted, the climbing of freak hills may only be possible at a higher road speed, and the machine may not like sidecar work. Engine compression ratio is possibly higher, so that the machine takes more handling, pinking is more common, and carbon must be cleared out at shorter intervals. The ignition lever may have to be used more skilfully and frequently. The piston is possibly of an alloy demanding increased clearance, and will "slap" till it is hot. Certain vital engine parts probably show a reduced margin of strength, and rank bad driving may break something. Upkeep charges need be no higher than those of a touring edition. Touring models are usually preferable for the inexpert rider, and also for pillion or sidecar work.

Mechanical Oil Pumps.

THERE are several new mechanical oil pumps for 1923, some of which will be heard of again. I was surprised at Olympia to find that my personal favourite, the Best, appeared in a new guise. After a mileage which is rapidly approaching five figures, I really thought that the 1922 pattern was perfect. If I had been asked to criticise it, I could only have said that if a careless owner let his tank run dry, it was rather a nuisance to have to recharge the oil-pipe, so as to renew the "pulsating column" of oil on which the feed depends. However, the 1923 model is obviously better still. It may be described as a "sleeve valve" pump, the working parts consisting merely of a piston and port slots; and as it positively draws the oil from the tank and dispatches it to the engine, a sight feed is not absolutely necessary, so that a trustful rider can both simplify his piping and clean up his tank top. As an example of how clean a motor cycle tank can look, the new Dot fitted with the Bradshaw engine stands out. It has a handsome saddle tank with just one solitary excrescence—the nickel petrol filler cap. I foresee a day when, what with twist-grip control, hub brakes, enclosed power unit, saddle tank, and mechanical lubrication, our machines will become as smooth as a cowhide suitcase. And a good thing, too.

"Clean" Units.

IT is possible to get a smooth-sided block of mechanism at the waist of a motor bicycle by two different methods. One is by designing the exterior of your gear box, engine, etc., in as few planes as possible, plus the use of capped nuts or sunk screws. This system is adopted on the Ray lightweight, which is streets ahead of any similar lay-out in this respect, and incidentally achieved two other forms of greatness at one leap, by adapting the flywheel dynamo to four-stroke uses, and by a price which is truly phenomenal considering what it includes. The rival policy consists of letting the various parts assume their natural shapes and then encasing them boldly in sheet metal, just as Huntley and Palmer convert 7 lb. of cracknels into a perfect cube. The most successful exponents of this notion are the Ner-a-car and the P. & P.

A CALIFORNIAN PANORAMA. Although the roads are rough the fine mountain ranges and magnificent canyons in California fully compensate for any discomfort in riding. The peak in the distance is San Jacinto (10,805 feet).

A SIDECAR HOLIDAY

On the Killin-Crianlarich Road.

From London to the Scottish Lowlands and the English Lakes. 1,300 Miles on a Medium-powered Outfit.

By LESLIE EVELEIGH.

AFTER deciding that our annual holiday should be a tour, my wife and I sat down to study *The Motor Cycle* road maps, and eventually agreed that we would attempt to see as much as possible of the North of England and Lowlands of Scotland in the two weeks at our disposal.

The "'bus" (a 595 c.c. Douglas sidecar) was given a clean up and a new tyre fitted to the back wheel. I always ride with either "Puncture Proofed" or "Challenger" tubes, and one of the latter was on the back, while the former were on the front and sidecar wheels. By this means I cut out the possibility of punctures (having tested them for some thousands of miles and found them absolutely reliable).

A Samaritan Sought in Vain.

We started away one Saturday morning from London and took the North Road *viâ* Grantham to Tuxford, where we stayed the night. Next morning we started off again with the intention of reaching Marske, a village between Redcar and Saltburn on the North Yorkshire coast.

Six miles from Tuxford the back spring of the sidecar snapped, and we rode to York with the sidecar flat on the chassis. Some time ago, fortunately for my wife, I put four extra springs in the sidecar cushion, so she was able to endure the jolting.

In York we were told that only one man could supply our need. Having found his place, which was closed, it being Sunday, I knocked and explained what had happened. Replying that this was the Sabbath, he promptly closed the door.

After this my wife decided she would "stick it," so we set off once more. From York we went to Helmsley, thence over the beautiful Cleveland Hills to Great Ayton, Saltburn, and so to Marske. Next day was spent with some friends while the garage people in the village were making a new spring.

The Wild Borderland.

On Tuesday we set out once more across the moors to Barnard Castle, and then struck north to Middleton-in-Teesdale. A really beautiful run this, which continued over the Cumbrian Hills to Alston. The last ten or twelve miles to Alston would be hard to beat for sheer wildness, and it would be unpleasant to run out of petrol anywhere on this stretch. Lunching at Alston, we replenished the tank and made for Longtown and the Scottish Border. Crossing this to Gretna, we continued on through Dumfries to Moniave, where we rested for the night, having covered 138 miles that day of ever-changing scenery of rare beauty.

Rain fell heavily, but we started away next morning for Turnberry, on the Ayrshire coast. Taking the Dalmellington road, we branched off and visited Loch Doon (of R.A.F. fame). Getting back to the road, we passed through Dalmellington to Ayr and down the coast road to Turnberry. Anyone in this district should run down the coast from Girvan to Ballantrae. I should imagine it would be hard to find a more attractive stretch to a lover of sea and rocks.

Friends in the district were visited on the Thursday, and on Friday morning we set out for the Trossachs *viâ* Glasgow, Stirling, and Doune (what a road!) to Callander. The latter place became our headquarters for the remainder of Friday and Saturday, with the object of seeing the lakes, falls, etc., in the district.

A Sidecar Holiday.—

On our trip to Loch Katrine the machine had to be left at the pierhead (the road runs no further at present, but men were noticed hard at work cutting a way alongside the lake), and we took the steamer up the loch and back, which is a trip not to be missed.

After seeing Loch Katrine we took to the road again and ran over the Pass of Leny to Loch Lubnaig. Continuing, we reached Lochearnhead and made the circuit of Loch Earn, one of the most wonderful lakes I have ever seen, and on the way back to Callander we struck inland through the valley to see Rob Roy's grave, where his wife and two sons are also buried, thence returning to Callander, tired, but with a wealth of memories.

Turning Southwards Again.

This brought us to the end of half our holiday, and we turned our thoughts southwards again, but were so enamoured of our ride the previous day that we decided to visit Loch Lomond on our way. So we ran up to Lochearnhead and took the Killin road, branching to the left, two miles from Killin, in the direction of Crianlarich. From here we dropped down to the head of Loch Lomond and so down the whole length of the "bonnie banks." After the other lakes I considered Lomond much overrated, or at least the lower fourteen miles. Skirting Dumbarton, we ran into rain again a few miles from Glasgow, so decided to stay the night in the Scottish "London."

Having plenty of time in hand, we next morning took the coast road *viâ* Greenock to Ayr, and it was well worth it. From Ayr we continued south over the mountain road through Dalrymple and Crosshill. After leaving the latter place we saw no human being or sign of habitation for twenty miles. But the scenery was grand, especially the climb known as the Nick of the Balloch. That night we spent in Newton-stewart, a quaint little place with some extremely pretty walks.

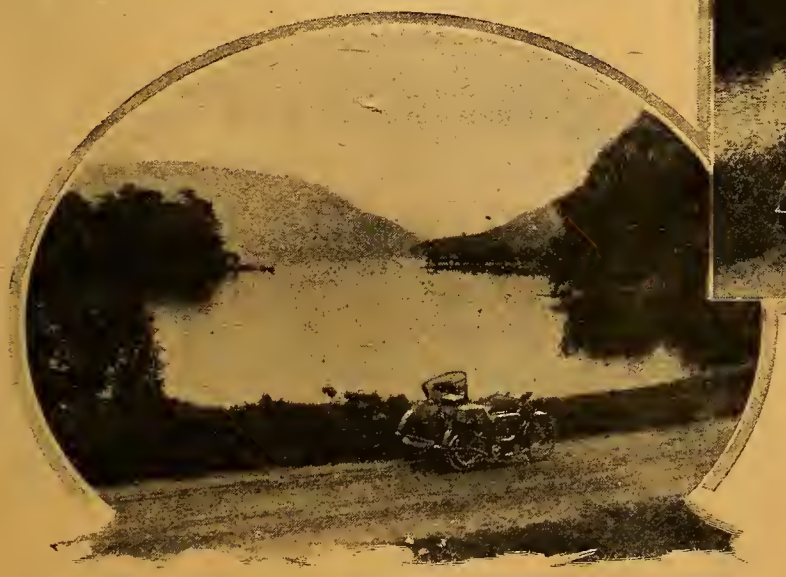
Next day we bade farewell to Scotland, travelling along the coast to Castle Douglas, thence *viâ* Dumfries and Carlisle to a village named Bothel, in Cumberland.

Only one day was devoted to the English Lakes, so in the morning we made our way round Bassenthwaite Lake, through Braithwaite, to Keswick. From there we took the Penrith switchback road (one of the most exhilarating rides), and turned to the right just before the town, for Ullswater. This lake is just wonderful.

On Kirkstone Pass.

From Patterdale there is no alternative but to try conclusions with the formidable Kirkstone Pass. We had never been in this district before, so did not know the hill. The first two miles were negotiated quite successfully, but my wife had to be tipped out of the sidecar on the 1 in 6 portion, and the last 200 yards were climbed with the sidecar empty. This was the only time on the tour that the machine failed, and the small amount of work the low gear ratio was called upon to do was really surprising. Continuing, we ran along the side of Lake Windermere and so to Lancaster, our stopping place for the night.

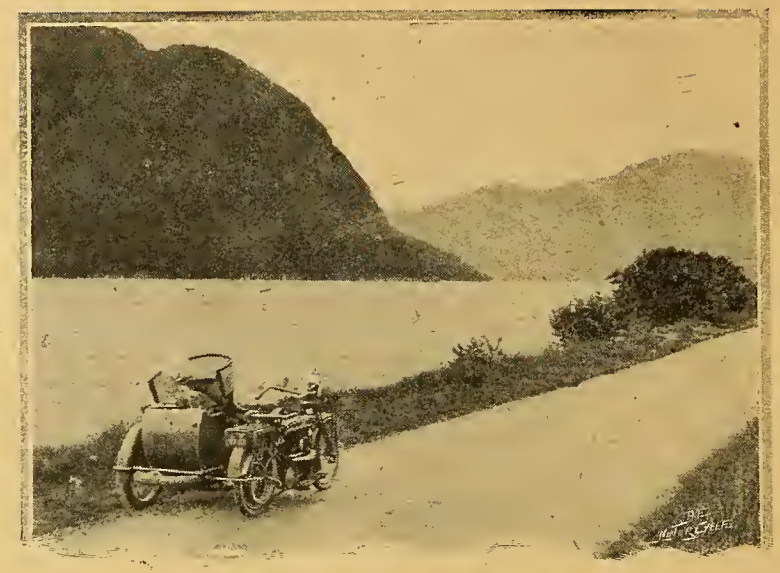
Wishing to visit the Peak District on the way home, our next stage proved the worst of the whole



(Left) On the placid shores of Loch Lomond. The road skirts the lake for a considerable distance.

(Right) Near Kirkstone Pass. The actual ascent commences to the right of the hill depicted.

A Sidecar Holiday.—



Loch Lubnaig between Callander and Lochearnhead.

series, embracing as it did Bolton, Manchester, and Stockport. Arriving in the neighbourhood of Buxton, we stayed at a little place called Taddington, and after tea took a short run to Tideswell, Chapel-en-le-Frith, and Buxton. There are some good climbs for the ordinary tourist on the main roads in the Peak District!

The next day, Friday, found us comparatively near home, so we took the road to Ashbourne after visiting Haddon Hall, thence to Matlock and Matlock Bath, and on to Belper.

A curious incident befell us on this road. The engine suddenly started to labour, and, despite a change of gear, conked out. In neutral it restarted easily, and seemed quite all right. Efforts to move, however, were quite ineffective, and a rattle came, apparently, from the gear box. While examining things an R.A.C. Scout and an A.A. Patrol came along, and both helped, and it took the three of us nearly an hour to discover that the "engine trouble" was due to ten spokes in the back wheel being broken, throwing the wheel out of truth and binding with the brake block in the belt rim. This, thanks to the condition of some of our 1922 roads.

Getting some new spokes fitted at Belper, we stayed the night at the Quorn, famous for its hunt, and next day arrived home, having covered 1,326 miles in fifteen days, on two of which the machine was not used.

Now a word for the machine; it was new in March, 1920, and had covered roughly 11,000 miles previous to this tour, on which it ran like a train. The only involuntary stop was the one which I have described. Just over 25 gallons of petrol were used; this works out at approximately 52 m.p.g., which is not bad, considering the hilly districts which were covered. I am always extravagant with oil, and used Castrol X.L. Thanks to the tubes, no tyre trouble was experienced, and the belt pulled out once, 72 miles from home, on the return journey. Altogether, our expedition proved a wonderful holiday, on which we can look back with infinite pleasure.

Expenses Sheet.

	£	s.	d.
Petrol (13 tins at 4s.)	2	12	0
Oil		12	0
Repairs (sidecar spring and spokes for back wheel)		16	7
Hotels, lunches, etc.	17	14	7
Sundries (post, etc.)	1	8	8½
Total	23	3	10½

Hotels and Inns.

Tuxford, Newcastle Arms.
Moniave, Craigdarroch Arms.
Callander, Waverley Temperance.
Glasgow, Duncan's Temperance (Renfield Street).
Newtonstewart, Galloway Arms.
Bothel, Queen's Head.
Lancaster, Bear and Staff.
Taddington, The George Inn.

Above is a full expenses sheet, covering everything, together with a list of hotels and inns visited, and will guide those planning similar expeditions in the coming summer. Of course, prices are getting lower.

All the above hotels can be recommended. We were quite fortunate in our choice of sleeping quarters.

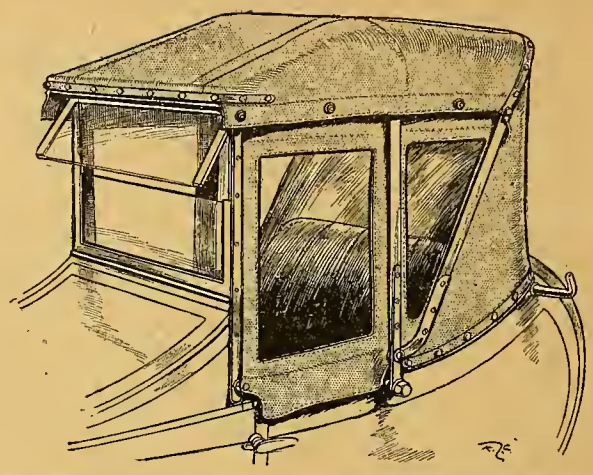
On the "Nick of Balloch," a wild, sparsely populated district between Dalrymple and Newton Stewart in the Western Lowlands.

THE "SUPER-SPORTS" JOY RIDE.

A Study in Speed Faces. By F. GORDON CROSBY.

Hoods and Screens on Modern Sidecars

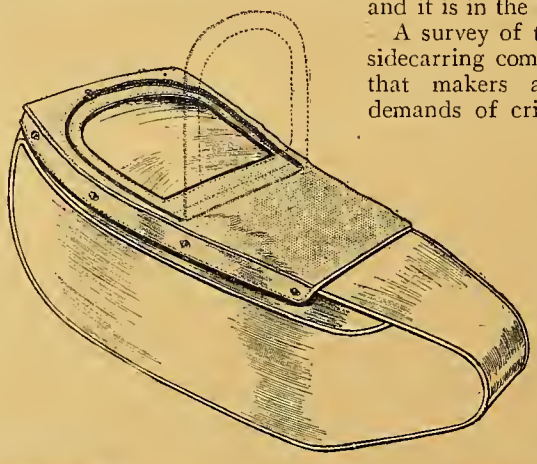
A Comprehensive Survey of Weather Protection Fitments for the Passenger.



An excellent all-weather New Imperial hood and screen Observe the accurately fitting side-curtains.

WHAT Spartans sidecar passengers were ten years ago! They faced all weathers in a little wicker sidecar on an equal footing with the driver on the saddle.

Of course it is not certain whether the saddle was not the better place in a downpour; the passenger had no screen or hood, and the draughts round the feet were even far worse than those in the "drawing room" of a modern villa with French windows—and that is saying a good deal. There were no grumbles about side draughts, hard cushions, bumpy roads or mechanical breakdowns.



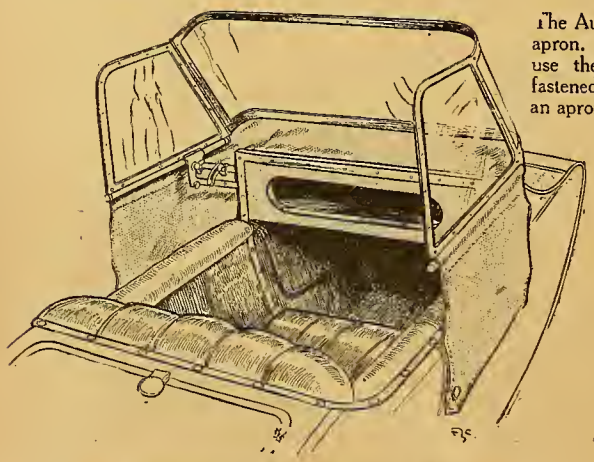
Passengers were, indeed, in those days as sporting as the driver himself; now, alas! they have screens, side-curtains, hoods, air cushions, hot-water bottles, spring wheels, instrument boards (equipped with mirror and watch), and small lockers religiously devoted to feminine fripperies—in short, they have been completely spoilt and made fastidious and critical.

We have the no-trouble machine: no trouble, that is, in the hands of an intelligent owner, and we have now to provide the perfect sidecar. Still, ever since the day we stuck a piece of oilcloth on two sticks to act as a screen have we endeavoured to pander and please, and it is in the nature of things so to continue.

A survey of the many devices that go to make sidecarring comfortable, if not luxurious, shows that makers are endeavouring to meet the demands of critical passengers.

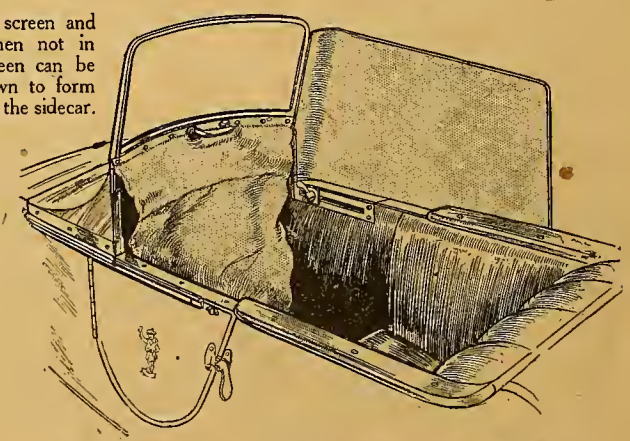
Ease of Manipulation.

Looking back on many improvements and innovations made during the past year, the most noticeable thing is the attention that has been given to combined hoods and screens, also rigid hoods which fold back instantly behind the body. Quick adjustability and simplicity is a worthy aim, for it is irritating indeed to have



A Bluemel screen adapted for use on P. & M. sidecars.

The Auster screen and apron. When not in use the screen can be fastened down to form an apron for the sidecar.



New Douglas screen on sliding scuttle. An effective side shield is also supplied.

Hoods and Screens on Modern Sidecars.—

to manipulate a badly fitting hood after the rain has started, and worse still to find the rain still beating in on the passenger at the side or through a gap between the top of the screen and the front of the hood.

Every hood should be so designed that it is instantly pulled over and locked into position by the passenger without the driver having to leave the saddle to tighten up a strap or fitting. A study of modern car hoods and the way some of the best designs lock on to the top of the screen without leaving a gap might be made with advantage. Side-screens, too, might be made to open with the door without having to fold back the hood.

Requirements in Sidescreens.

Up to quite recently even cars have been notoriously draughty when equipped with the ordinary cape hood and the old type sidescreens, and sidecars are just as bad. If the flat screen is to persist, the problem of sidescreening will have to be tackled afresh. Quick adjustability and freedom from cracks and crevices that permit irritating draught should be the designer's endeavour. Even when perfect-fitting sidescreens are provided, the job is unfinished if an accessible storage place is not found for them. It will not do to pack the sidescreen underneath the seat, behind the back cushion, or anywhere that necessitates the passenger moving. It may seem an insignificant item, but it is such small details that make or mar the pleasures of sidecarring.

Probably the solution of all the difficulties in connection with flat screens and folding hoods was attained when the adjustable Easting screen was introduced. Its designer solved the question in a simple manner and gave comfort to thousands of passengers who had hitherto imagined sidecarring to be a cold and draughty pastime.

In spite of the unquestioned utility of curved flexible screens, however, there are people who dislike the celluloid and the comparatively large loose area of apron, and it is these fastidious passengers with a preference for the transparency of glass screens who give the biggest problem to designers. Still there is much to be said in favour of the adjustable celluloid type, and the sidecar manufacturers have to thank its sponsors for the stimulation it gave to sidecarring in general.

Flexible Screens.

The advantages of the flexible type, which includes not only the Easting but the Cameo and the Sandum, are its ease of attachment and quick adjustment. The Easting and Sandum can be raised and brought backward so that they form excellent substitutes for a hood in an ordinary shower.

All the accompanying illustrations exemplify the interest makers have in the question of weather protection. Several of them are ingenious and show a practical knowledge of what the passenger really requires. The Holt celluloid screen, for instance, is simplicity itself, and if it stands the test of moderately rough usage it should become a popular type; the Sandum miniature folding screen, too, is a desirable little fitment, practical, light and sound in construction and well adapted for a child's seat.

It must be admitted that many screens sold with sidecars are quite useless. The hoods, too, leave much to be desired. If the Easting or Sandum type of screen is to be used all well and good, the user knows exactly the protection he will get: but if the tendency to use the flat screen is fostered, then more attention will have to be paid to the efficiency of the sidescreens and to the designing of these in conjunction with a well-fitting hood, and a door that opens without having innumerable fasteners to manipulate.

The little screens attached to sporting bodies cannot very well be altered, and as a matter of fact some of these are astonishingly effective when the passenger assumes the usual reclining position. The aforegoing remarks, however, apply chiefly to touring sidecar protection, and there really is no reason why grace of design should not be maintained, even though a glass screen be used with permanent transparent side-curtains, and a door which opens with the sidescreen in position.

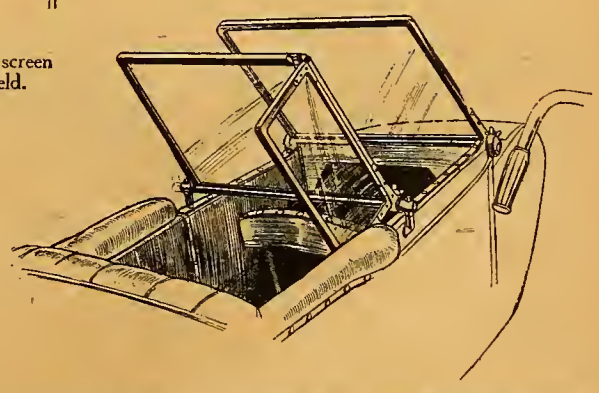
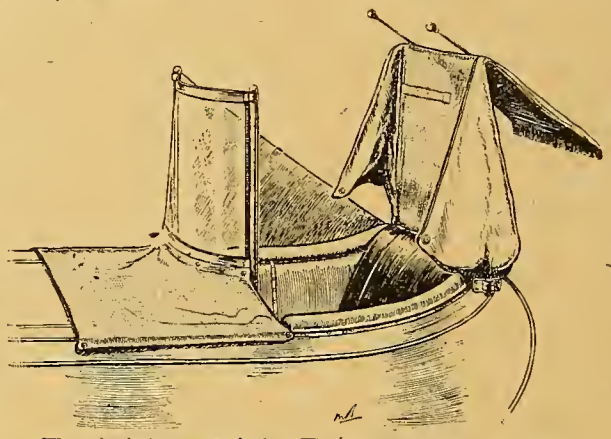
Compact Hazlewood hood and screen



Double screens on the Matchless two-seater sidecar, the rear design being the Orto pattern modified to suit.

Hoods and Screens on Modern Sidecars.—

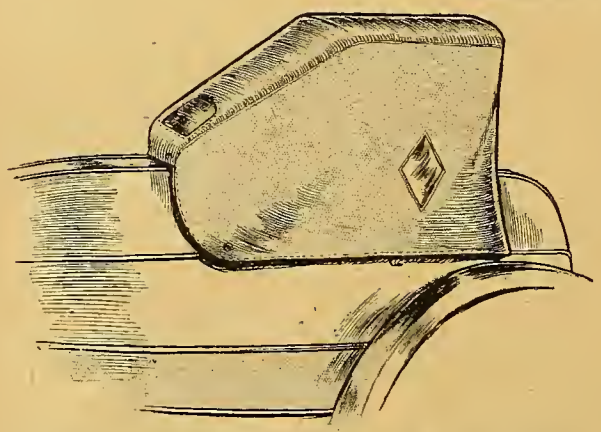
Probably one of the biggest drawbacks against the development of efficiently protected sidecars is that the screen-makers and body designer so seldom work in co-operation. The body-maker may be striving after points he considers essential but which do not harmonise with the modern proprietary screen and hood. Many firms, of course, adapt and modify excellent accessories to their own particular sidecars, and when this is done a harmonious whole generally results. In those cases, too, where the makers of an outfit have considered the question of the hood and screen in conjunction with their sidecar body, designing specially and not adapting existing designs, the result is usually a success. A good example of this is the New Imperial all-weather design shown at the heading of this article.



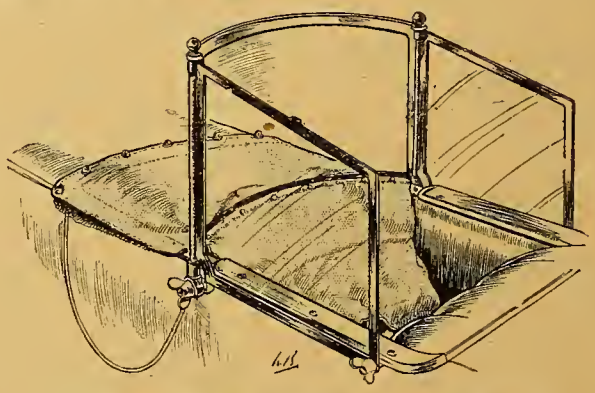
The chief features of the Thapex hood are its quick adjustability and neat construction.

Several makers have departed completely from the orthodox style of folding hood and instead have fitted a cover which forms hood, side curtains, and screen all in one. This slips easily on to a quickly erected framework. It is an excellent scheme where light weight is the all-important consideration, but it must be confessed that the passenger becomes rather isolated and can see very little of the scenery and practically nothing of the driver. But he (or she) is not likely to be interested in scenery in the midst of a rainstorm.

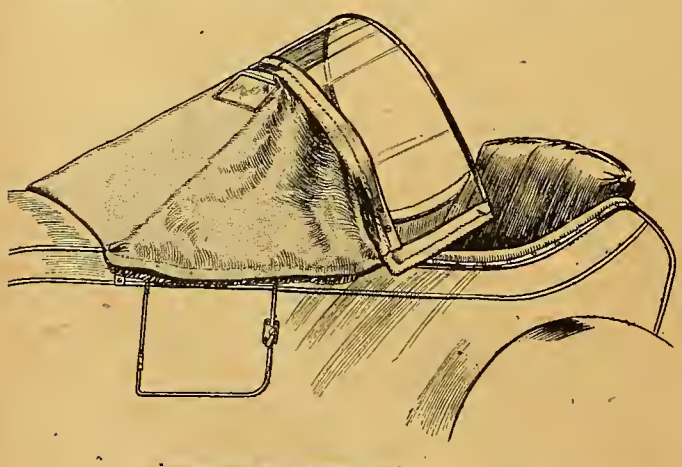
There is no doubt that the problem of effective sidecar protection is bigger than might be imagined, but, like car manufacturers, sidecar designers are alert to the insistent demand for the abolition of the discomforting side draughts, and there is not the slightest reason why this should not be eventually achieved.



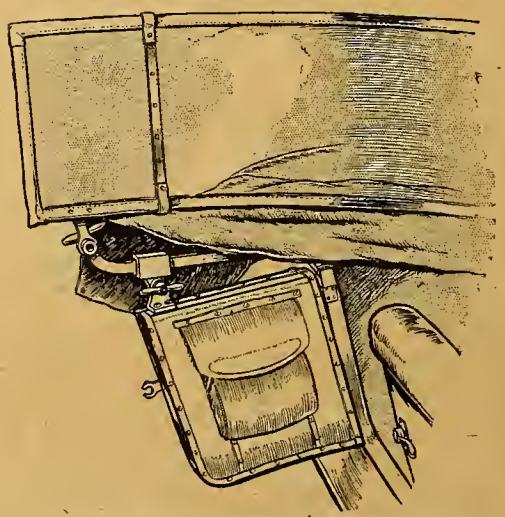
Combined screen and hood included in the Swallow sidecar equipment. A few seconds only are needed for its erection.



The familiar Cameo screen with effective side shields.



Years of satisfactory usage have proved the Easting to be everything the makers claim for it. It is the pioneer folding screen.



An admirable feature of the Sandum is that it folds back with the door, thus obviating the unfastening of attachments.

MODERN IDEAS IN WEATHER PROTECTION.

Legends & Superstitions

by

Chas. G. Harper.

Varied Stories of Varied Places. Names and Scenes and their Associations.

A village sign at Lye, Worcestershire, commemorating the myth that vast Russian armies passed through the place.

EVERYONE loves a legend, and most people are superstitious. I have a superstitious objection to walking beneath a ladder, and I always touch wood when, in answer to enquiries, I confess to being, and doing, well. Generally, under those circumstances, I touch (if it be possible) the head of the person who makes the enquiry. This age-old action causes great fun. But the point is that you must carefully choose your man. Choose an equal, or an inferior, or someone who owes you something or other. Even then, it is desirable he should have a sense of humour.

Well, then, we have got away with the beginning of this serious subject. It is a subject of vast proportions, for legends are always in the making. There was, for example, that amazing and widespread legend, absolutely unfounded on fact, which, in the early part of the Great War, told us of vast armies of Russians who were travelling through England to help us on the Western Front. Some people actually said they had seen them, and a slot-machine on the platform at Crewe even was said to have been put out of gear by a Russian soldier placing one of his country's coins in it. As our automatic delivery machines are not constructed for kopecks, its digestion was said to have been ruined.

Swaffham's sign of a pedlar who was reputed to have benefited the town by his find of a treasure.

That "Russian Army" story has never been forgotten, and it bids fair to become a classic since the design for the village sign to represent Lye (formerly called "The Lye"), a place situated in the Cradley Heath district of Worcestershire, was adopted. The mordant wag who invented the design, illustrated here, gibbeted that legend and made some humorous capital out of the place-name, all in one stroke.

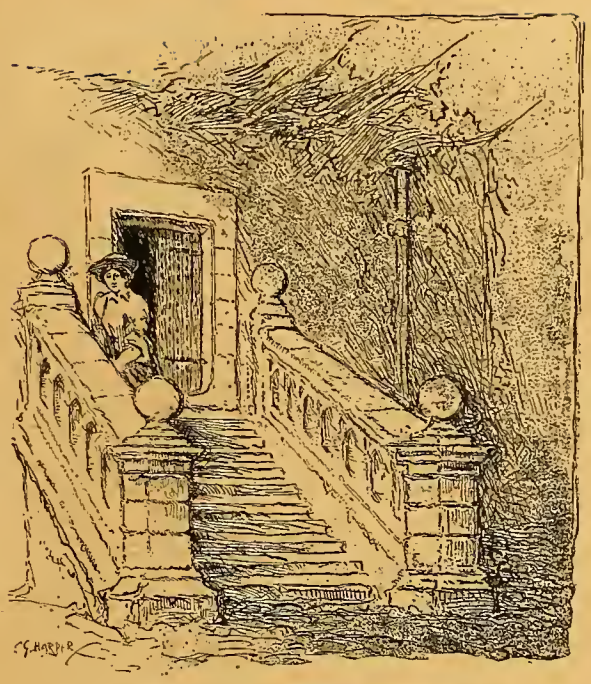
Entirely on the serious side was the legend, long held by some to be worth credence, that Lord Kitchener really was not lost in the *Hampshire*, but that he was made a prisoner and was held in Germany. This belief may have been due, in part, to the inclination, greatly to be observed at that time, to believe any story of marvels. Marvel-mongers found many eager listeners. But such ready belief in the improbable was nothing new. English history alone is full of it. It was long believed that Richard the Second was not really murdered in the castle of Pontefract, and that belief caused Henry the Fourth a good deal of trouble in dealing with pretenders. As he was responsible for the death of Richard, this seems to have been quite in order.

The legend that King Arthur lies sleeping somewhere, and will return to help England in her hour of need, is well over a thousand years old. There was opportunity enough for him during the great war of 1914-18, but he did not put in an appearance; although the "Angels of Mons" are reported to have been on the spot at a critical moment. Let us doubt those angels. The "missing heir," too, finds a ready acceptance, for romance inhabits every heart. So it was, a generation ago, that when the butcher, Arthur Orton, an enormously fat and a very uneducated man, coming from a place in Australia with the intolerable name of Wagga-Wagga, set up a claim to be Sir Roger Tichborne, and laid claim to the family estates at Tichborne in Hampshire, his contention was popularly accepted. And not only by the people, but by two or three of the family. His claim was defeated, and he suffered a long term of imprisonment, but there are many yet who believe in that claim. Certainly, on his release, after many years, having grown old and lost all that too much flesh, he did indeed look an aristocrat.

The rustic belief in legends is of the most robust kind. In a by-lane off the Great North Road north of Potter's Bar there is a singular and not beautiful brick gateway to Brookmans Park. It was built, probably, about the time of Henry the Seventh. The rustics have the oddest belief that "Folly Gate," as they call it, has a farthing placed between every one of its bricks. How this notion could have arisen no

Legends and Superstitions.— one can truly say, but the suggestion may be offered that there is some confusion in the rustic mind deriving from the old price of bricks, which was round about a farthing apiece.

Then there is the ancient legend of Swaffham, which tells how a pedlar dreamt of a treasure which would be his if he journeyed to London and met a stranger on London Bridge, who would tell him of the spot where that wealth would be discovered. He travelled to London, and (always according to the story) found the treasure at home in Swaffham. This fairy tale seems really to be based on the career of a man named Chapman, who, five or six centuries ago, provided the money for rebuilding portions of Swaffham church, in which there will be found little carved figures of a pedlar and his dog. A pedlar was, in those times, a "chapman"; and it would thus seem that the tale is merely a play on the personal name. Some versions make him a tinker; but they ignore the obvious play upon the name. That is the variant of the legend adopted for the village sign of Swaffham, set up last summer.



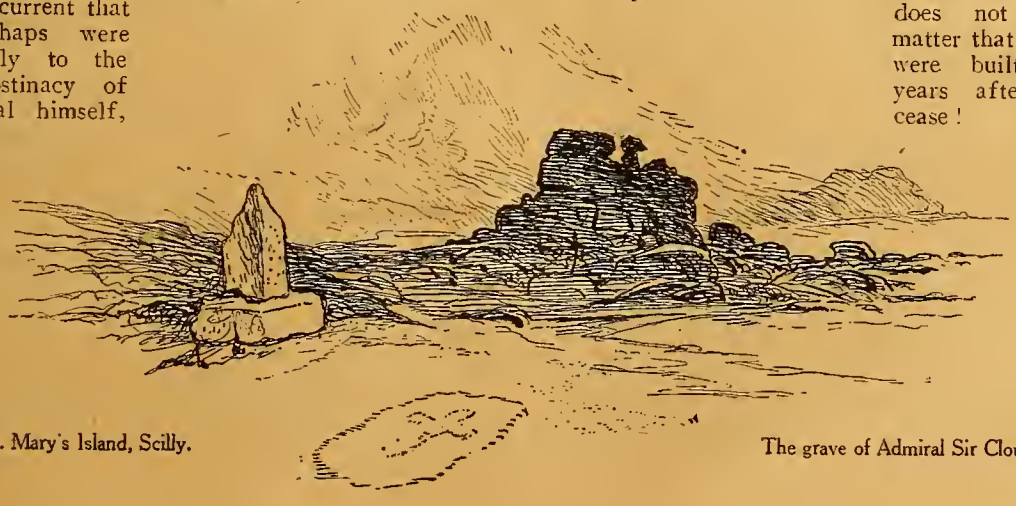
Dorothy Vernon's steps, Haddon Hall, Derbyshire.

On a Lonely Island.

On a solitary sandy seashore at Porthellick on St. Mary's Island, in the Scilly Isles, beneath a weird pile of rocks resembling a squatting loaded camel, is the spot where the body of Admiral Sir Cloudesley Shovel was cast ashore in October, 1707, after the fearful disaster in which four ships of his squadron were wrecked, owing to their course having been lost in foggy weather in those dangerous seas. Legends were long current that these mishaps were due entirely to the savage obstinacy of the admiral himself, who not only refused to listen to a sailor on board his flagship, who had warned him he was steering too far northward, but actually had the man hanged at the yard-arm for presuming to know better than his superiors. The story then proceeds to declare that the sailor, before he was hanged, asked to be permitted to read a portion out of the Bible. This was allowed; and read a part of one of the cursing Psalms—Psalm 109—in which occurs the passage: "Let his days be few; and let another take his office. Let his children be fatherless, and his wife a widow. . . . Let his posterity be destroyed, and in the next generation let his name be clean put out. Because his mind was not to do good, but persecuted the poor, helpless man, that he might slay him that was vexed at the heart."

One man only was saved from the admiral's ship: George Lawrence, quarter-master. He told no such story, but said only that they thought they were off Ushant; whereupon a sailor-lad declared a light they presently made was Scilly. The crew then swore at him. Nothing about any hanging. Where the admiral's body was found it was buried. Four days later it was exhumed, and lies now in Westminster Abbey. Local superstition declares that on the spot, roughly marked by a cross, grass will not grow. It will not; nor is that fact altogether remarkable, seeing that these sands are swept by salt spray.

Believe in legends, if they are old; the modern one of Dorothy Vernon, for example, does not deserve credence. But, owing to the great romantic heart of the sentimental public, it is impossible to destroy it. The steps down which she went are pointed out: it does not seem to matter that those steps were built sixty-five years after her decease!



Camel Rock, St. Mary's Island, Scilly.

The grave of Admiral Sir Cloudesley Shovel.

The Fifth of a Series of Instructive and Practical Notes for the Beginner.

Explaining in Non-technical Language Points which may have Mystified Him.

MANY motor cycle engines disgorge a proportion of their lubricant over the outside of their crank cases. This is quite unnecessary, and with a little careful attention the defect can be arrested. A dirty engine is one of the worst advertisements a motor cycle can have, because it means ruined clothes unless overalls be always worn, and no motor cyclist should be compelled to don overalls save for long journeys over bad roads. To stop "oil-slinging," first trace the principal point of leakage of the oil: wash the crank case clean with a brush and some paraffin or petrol, and then take the machine for a short run. On the return, examine the engine closely, and make a mental note of the place or places where the slightest trace of oil is apparent.

OILY ENGINES.

◈ ◈ ◈ ◈

IF oil has made its appearance around the timing cover joint, and from the tappets, detach the crank case air-release valve, which is generally fitted either on the timing cover (and may communicate with the front chain case) or on the dividing wall between the crank case and timing case. The former is usually a ball valve, the latter a disc valve. The duty of this valve is to allow oily mist to escape from the crank case on the downward strokes of the piston, and to prevent air and dust being sucked in on the upward strokes. Should the valve be jammed in its closed position it follows that the downward strokes of the piston will occasion a certain amount of compression in the crank case, and the oily mist within will tend to force its way through the various joints. and past the tappets. Even the best machines are liable to this derangement.

SOME POINTS OF LEAKAGE.

◈ ◈ ◈ ◈

SHOULD the crank case release valve be functioning correctly, however, and oil still leaks from the timing cover joint, it is probable that at some period the cover has been removed and has been replaced with a defective washer. In this case the only possible cure is to remove the cover, and to cut a brown paper, or, better still, a thin sheet fibre washer, to the exact shape. There is a number of proprietary jointing compounds on the market wherewith to smear the washer before replacing the cover, but seccotine or gold size is widely used for this purpose with most satisfactory results. Occasionally a trickle of oil will make its appearance from beneath the head of one or more of the screws which hold the timing case cover in position, and a strand of asbestos string coiled just below the head of the offending screws will result in a certain cure.

MAKING OIL-TIGHT JOINTS.

A LEAKAGE of oil from the joint between cylinder and crank case may be caused by (*a*) a defective washer, or (*b*) by the two halves of the crank case being bolted together in such a manner that they do not provide a perfectly even surface for the cylinder to pull down on to. It is sometimes possible for the latter to occur when the crank case has been taken apart and re-assembled by a not-too-expert workman. The only remedy in both cases is to renew the washer, either with brown paper or with sheet fibre.

CYLINDER JOINTS.

◈ ◈ ◈ ◈

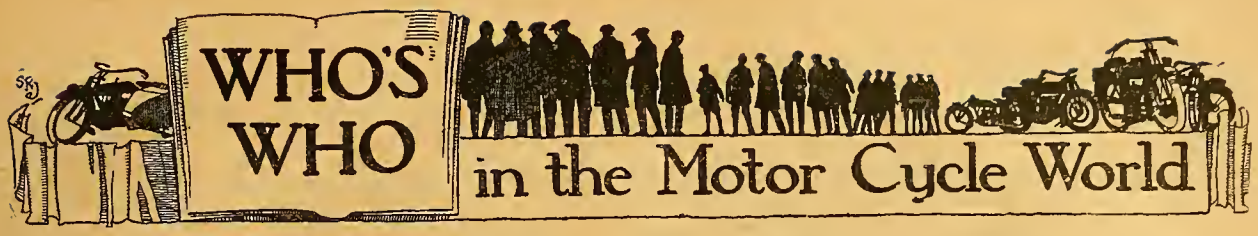
THE two halves of the crank case are generally spigoted together, which means that one has a projecting ridge formed around its circumference, while the other has a recess into which the ridge can fit snugly. No brown paper or other form of washer can, therefore, be fitted between the two halves, and the factory method adopted of making this important joint oil-tight is for the two halves to be ground together after machining and before assembly with the aid of a little abrasive paste, just as a valve is worked on to its seat. Despite this precaution, however, it sometimes happens that oil sweats out of the joint, frequently in the fore part of the crank case immediately below the cylinder, whence it can find its way over a good portion of the surface of the crank case. The only practicable cure for this, short of disassembling the crank case, is to adopt a method of "caulking." This consists of tapping the seam between the halves of the crank case, at the point where the oil exudes, with a very light instrument, such as the rounded edge of a small set spanner. The tapping surface must, of course, be perfectly smooth, otherwise the soft aluminium will be abraded. The effect is to spread the metal infinitesimally, but just sufficient to allow the minute orifice to be sealed.

OIL LEAKAGE ROUND CRANK CASE.

◈ ◈ ◈ ◈

NO motor cyclist likes to think that he is paying the petrol combines more money than he need. Aids to petrol economy are, therefore, a good selling line amongst those who believe all that the manufacturers of such accessories have to say. It is not always to the carburetter and induction system, however, that one must turn in order to obtain improved consumption. The fitting of a small jet does not necessarily mean that better petrol consumption will be the result. Nor is it possible to lay down "correct" jet sizes—every carburetter should be tuned to suit the particular engine. When in quest of improved consumption, before blaming the carburetter for an unquenchable thirst, satisfy yourself that the fault does not lie with the engine itself.

ECONOMY IN RUNNING.



Fourth of a Series of Short Biographies of Personalities Prominent in the Movement and frequently mentioned in the pages of "The Motor Cycle."

Frank Albert Applebee, Motor Engineer, London.—F. A. Applebee, who is 35 years of age, was born at Walthamstow. As the son of F. W. ("Pa") Applebee, he came into the motor cycle movement early, and over a long period before the war he was one of the most successful competitors in open events. He made his first appearance in an open competition in the A.C.C. Hill-Climb at Haslemere in 1907 recording the fastest time of the day on a twin Rex. He rode in all the T.T.'s from 1907 to 1914, attaining his greatest success in 1912, when he gained the Senior T.T. on a Scott. In 1913 he won the Spanish T.T. His present mounts are various, but favourite type is a sidecar. Hobbies: Motoring and Photography.

Thomas Rutherford, Woollen Manufacturer, Carlisle.—Mr. Rutherford was born at Bonchester, Hawick, and is 44 years of age. He has had many successes in competitions, and has rendered valuable service to motor cycling on the administrative side. He has served on the general, competitions, and touring committees of the A.C.U., and is the local consul for the Carlisle area. In 1922 Mr. Rutherford was Chief Marshal for the T.T. Outstanding performances on a motor are: 1919 A.C.U. Six Days Trials, gold medal; 1920 Scottish Six Days, silver medal; Paris to Nice, declared void, but claimed full marks; London to Edinburgh, gold medal; and numerous wins in Cumberland County trials. Present mount: Sports Sunbeam. Hobbies: Business, motoring, shooting, fishing, and golf.

Frank Smith, Engineer, Wolverhampton.—Frank Smith, who was born at Thrapston, Northamptonshire, 35 years ago, is the founder of the Clyno Co., and has done much to prove the sidecar a reliable and economical vehicle. A brief record of his major competition successes is appended: A.C.U. Quarterly Trial, 1911: Only sidecar driver awarded 1st Class Certificate M.C.C. London to Land's End, 1911: Sidecar cup (only driver of sidecar to finish); Scottish Six Days Trials, 1911: First sidecar driver to gain gold medal in this trial, no marks lost; Porlock and Lynton hills climbed for the first time by sidecar in October, 1911; M.C.C. London to Land's End, 1912: Sidecar cup; M.C.C. London to Edinburgh, 1912: Won the only two sidecar cups; Sutton Coldfield A.C. Open Trial, 1912: First sidecar to win the Colmore Cup; Liverpool One Day Trial: Only sidecar to make non-stop in entry of 104; first sidecar ascent of Honister Pass; Scottish Six Days Trial, 1912: Gold medal (only sidecar to climb Kenmore); A.C.U. One Day Trial, 1912: Best passenger performance. Present machines: 925 c.c. spring frame Clyno sidecar and 10 h.p. Clyno light car. Hobbies: Swimming, diving, and boat sailing.

George Grinton, Motor Agent, Edinburgh.—Was born at Edinburgh 30 years ago, and has been as successful in speed events as in reliability trials, in solo work as with sidecars. Is one of the best-known competition riders north of the Tweed. In the present year he was second in the Junior T.T., was Scottish speed champion (unlimited class) and winner of A.J.S. trophy in the Highland Trial, besides gaining numerous firsts in speed events and gold medals in reliability trials. Is a strong advocate of a sidecar T.T. for machines from 500 c.c. to 1,000 c.c., and suggests a championship meeting between the representatives of Scotland, England, Ireland, and Wales. Present mount: 584 c.c. Harley-Davidson, and 998 c.c. Harley-Davidson. Hobbies: Motor boating, shooting, and fishing.

Eric Williams, Motor Engineer, Worcester.—Eric Williams, one of the most popular of competition riders was born at Homer in Herefordshire 29 years ago. Has scored many notable successes, particularly on the A.J.S. machine, was first in the 1914 Junior T.T. Became a despatch rider in the Royal Engineers in 1914, and received the D.C.M. in 1915. Since the war, has accomplished many fine performances. Won the Herefordshire Auto Club Bowl, also the Colmore Cup in 1920 (on a 496 c.c. N.U.T.). In the same year gained the Reliance Cup and made fastest lap in the Junior T.T. He came first in the Junior T.T. in 1921, and in the same year and this last summer secured the first position in the 350 c.c. class of the International Six Days Trial. Present mount: A.J.S Favourite type of machine: 350 c.c. single. Hobbies: Fishing and tennis.

William Pratt, Motor Agent (Manager), London.—Billie Pratt is a Londoner, born 45 years ago, and has for many years been prominently associated with the motor cycling industry. Was a very successful competition rider. Enlisted as a despatch rider in 1914, and in 1916 transferred to the Tank Corps in a similar capacity. Was severely wounded in 1917, and had to give up motor cycle competition riding, although riding to business every day and averaging ten to fifteen thousand miles per annum. Pre-war successes include the following: 1909, 1910, 1911, and 1912 trade team (P. & M.) prize and gold medal in A.C.U. Six Days Trials; 1st prize for best performance, trade rider, Scottish Six Days Trials, and three gold medals 1910, 1911, and 1912; Land's End to John-o'-Groats A.C.U. Six Days Trial, 1910, gold medal and team prize; and several golds in M.C.C. London-Land's End, and Exeter and Edinburgh trials. Was captain of all the trade teams in the Anglo-Dutch Trials, and obtained the highest awards and the motor cycle medal. Present mount: Matchless spring frame sidecar. Favourite type of machine: Spring frame sidecar. Hobby: "Experimenting in wireless telephony."

WHAT I RODE IN 1922.

By "IXION."

Four-valve and Sleeve-valve Singles and Two-stroke Twins. Comfort and Controllability as Speed Assets. Improved Lubrication Demands.

PRIDE of place must go to the faithful 'bus on which the vast majority of my mileage was covered—an o.h.v. Triumph. For the moment I am not going to enlarge upon its power or speed, though it has plenty of both. Comfort is the supreme impression which this machine makes on its lucky owners.

The layout of the frame, the Druid forks, and the 3in. tyres combine to endow it with road-clinging and road-cushioning qualities such as exceedingly few motor cycles and very few cars possess.

Several machines are enshrined in my memory as able to make a really bad road tolerable, and an ordinarily bad road so unobtrusive that questions of comfort simply don't occur to the rider's mind. The 1914 A.B.C., the 1919 A.B.C., and the special 3in. tyred Scotts—no others ranged in the top class with me till 1922. But the o.h.v. Triumph is just about as good as any of them.

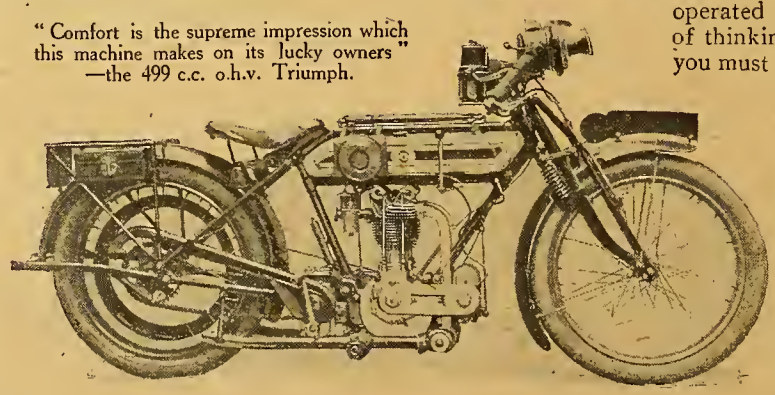
Scoring over a Car.

Almost daily I traverse one of those typical sections where a very expensive road carpet has been laid down over bad foundations, and then hammered into great ulcers by lorries and coaches. I cross it on every kind of vehicle imaginable from a Rolls-Royce to a baby two-stroke. I cross it fast only on my Triumph, and, despite the extra speed which the machine renders possible, it sits almost as well as the most costly cars. Moreover, the absence of shock and jar is accompanied by perfect steering. Whether there be potholes or not, I can guide it through the 35in. hole in the traffic which the 33in. bars demand.

Its reliability scutcheon is dimmed by one blot, for the ball bearings of a valve rocker shaft once held me up very badly indeed. The replacement set has done 3,000 miles without a hitch, and no other stoppage of any sort or kind has occurred. Nothing has come loose or fallen off or broken. There have been no punctures, though Challenger tubes have had their say in that, to judge by the nails I have pulled out. The speed is quite considerably over 60 m.p.h. on top, and the tune is held so well that no tinkering is needed between times; you can pull out that mile-a-minute roar whenever you want to. Decarbonisation is the only attention which must be given at intervals, and the makers advise it every 700 miles. I am afraid that the nefarious use of plenty of benzole in the fuel is my accomplice in waiting till 1,400 miles or so.

Ample Power.

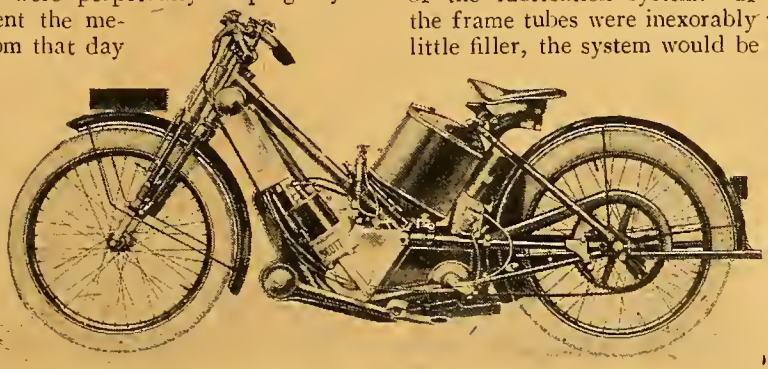
Power is such that, even on the highest set of ratios, bottom gear permits me to tick timidly up freak hills with the throttle shut. It is not a mighty top-gear stuntist, in which it corresponds to many other hot-stuff singles; the gear box is there to be used, and I use second gear more than I have ever done on a 500 c.c. solo mount. It is as necessary for a thunderclap acceleration as it is on a stiff hill. The air and spark levers also come into pretty constant use. But the gear change is as easy as slicing bacon on one of those fascinating machines which grocers use. Not for us the harassed expression of the car driver, and the subsequent sound as if one were pushing railway lines into a saw-mill. Sure, silent changes—even from top to bottom—at any speed you like to mention are the lot of the Triumph rider; furthermore, the gear lever is accessible without fouling the knee, and is operated without the necessity of thinking which side of a gate you must take. The rear brake is excellent; but I am not one of those who can make any excuses for a stirrup front brake in A.D. 1922, regarding it as an unpardonable and all but useless anachronism. Hot or cold, with or without the decompressor, the Triumph is always a



"Comfort is the supreme impression which this machine makes on its lucky owners" —the 499 c.c. o.h.v. Triumph.

What I Rode in 1922.—

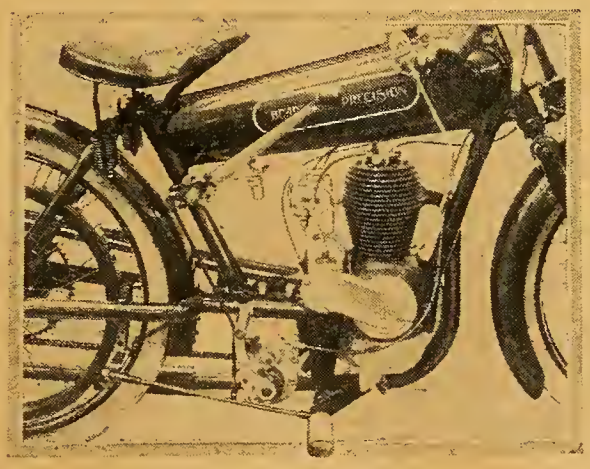
"first kick" starter. The sparking plug is, as all critics allege, somewhat inaccessible. But you can get it out—on one occasion I had to do so—with no weapons but a pocket screw-driver and a large stone. Early in the season I had to take it out pretty often, for a well-cooled plug detests oil, of which a hot-stuff engine requires full rations. Then I made the happiest discovery of my year, and put on a Best mechanical pump. Fitting it was by no means as simple a job as its vendors led me to expect, and when fitted it looks like an excrescence. Nevertheless, it has multiplied my riding pleasure by 100%. Prior to mounting it, I was eternally worrying about oil—aluminium pistons create special anxiety in that respect; memory, milestones, speedometer, engine beat, engine feel—all these factors were perpetually keeping my brain abubble. On went the mechanical pump, and from that day to this I never think of the word "oil" when once the garage door shuts behind me. It is the greatest godsend which progress has brought to motor cycles. If it will suffice for hard riding on a hot-stuff 'bus with an aluminium piston, it will suffice for anything; and it only remains for all makers to incorporate it in some safe and unostentatious cranny of the machine. Human beings do not carry their vital organs projecting from their elbows, and I resent wearing my oil pump as a sort of wart on the timing cover. An o.h.v. Triumph is quite emphatically the goods; *plus* a Best pump, it is twice itself.



"... 198 lb. all on, and 60 m.p.h. That is surely tabloided speed and power?"—the 486 c.c. Scott Squirrel.

Two-stroke Twins.

Three Scott Squirrels have enlivened my season—one of them for a substantial mileage. Any of them could quit my Triumph by a couple of hundred yards in a 2-mile friendly scrap along ordinary roads, for their natural cornering is better than a Triumph with Dance or Bennett "up." None of them could hold the Triumph on the dead straight. On the other hand, they weigh the best part of a hundredweight less, and the tax is according. They drink more petrol, and ask for a little sympathetic tinkering at times. But if you want something which is delightfully easy to handle, which holds the road, and which can mop up anything anywhere on British roads, buy a Scott Squirrel. Prof. Low says that in fifty years our food will consist exclusively of tabloids; when the tabloid era dawns, 3-cwt. solo 'buses will be obsolete, but the Squirrel will still be there—198 lb. all on, and 60 m.p.h. That is surely tabloided speed and power? If and when an unkind fate compels me to buy my last motor cycle, and to keep it until a bath chair or a hearse constitutes my sole locomotion, the final cheque will be signed to the credit of the Scott Co. The Squirrel would probably enjoy a far greater vogue if it were obtainable with a three-speed gear. It appeals to the sporting rider, who frequently ventures into the freak hill zones; but the two-speed gear is not fully suited to freak hills. Hence many riders who fancy the machine reluctantly order a three-speeded four-stroke. There is nothing to criticise about the Squirrel, except the tiresomeness of the lubrication system. If the storage of oil in the frame tubes were inexorably wedded to such a silly little filler, the system would be better scrapped; however, at the Show I saw that a more conveniently located filler was being introduced. When a single oil gauge, not requiring a glance more than once a day, suffices for eight-cylinder cars, two gauges are out of place on a twin.



"A novice can strip the engine down to its vitals in a very few minutes, and can make no error"—the 349 c.c. Beardmore-Barr and Stroud.

For two months or so I rode a Beardmore-Precision with the Barr & Stroud engine. As this frame design is applied to several different engines, the machine and power unit demand separate study. On ordinary roads the frame layout is simply perfect, but on colonial roads the fork is a shade too lively—for example, I should not pick it to lead me through a Scott trial. The principle which presumably inspired the frame at its origin seems to have been lost sight of in topping off the details. For example, it is delightful to have a tank which also forms part of the frame, and is innocent of the usual filthy chinks and crannies. "Cleanliness" seems to have been the designer's key motive. But he did not persevere. The stand is angle steel. The valve lifter and front brake—to name two instances—are quite exceptionally full of dust-traps. Nor do I quite like the way in which sundry items, vulnerable in the event of a toss, are threaded through parts of the main frame. If a toss bends a footrest, one can pick oneself up and laugh; but if it strains a frame . . .

What I Rode in 1922.—

The Barr & Stroud engine was brand new when it came into my hands, and, when it was surrendered, had not developed the running typical of its family. For example, it never did 60 m.p.h. or anything like that speed. In the absence of a speedometer I should judge that 45 m.p.h. was the fastest I touched upon it. Fuel economy, on the other hand, is even better than the maker's claim. I regularly accomplished 160 m.p.g., which is really phenomenal for 350 c.c. The engine is an easy starter, fundamentally reliable, and uniquely simple to dismantle; a novice can strip the engine down to its vitals in a very few minutes, and make no error (except a petty timing blunder) in building it up again. This is a most valuable feature. Not designed for road-burning, the machine is just a good, steady goer. It is less silent mechanically than the elimination of valve clack might lead one to expect; for when that familiar noise is gone, one hears the front chain more distinctly, and the driving gear of the sleeve valve is also audible. The engine is certainly a very welcome addition to the conventional types, and there is no snag to be recorded against it. In the way of criticism I can mention nothing except the noisiness of the release valve when opened, which naturally spits like a two-stroke; this does not concern a man who drives on clutch and throttle, as all good motor cyclists do. I had expected it to be rather a sticky starter from cold, but the first kick frees it on a cold morning, and it starts on the second kick.

None of the other machines which I rode for shorter distances justify any special mention; either they were undistinguished, or else the mileage was too brief for any opinion of value to be formed. Nor, apart from the oil pump already described, did I make the acquaintance of any accessories of really outstanding merit.

FRANCE AND THE MOTOR CYCLE.

Why the Movement has Not Developed as well as in Great Britain. Prospects for the Future

By OUR PARIS CORRESPONDENT.

SURPRISE is frequently expressed by British motor cyclists at the wide difference which exists between the development of the motor cycle movement in Great Britain and in France. While Great Britain has some 380,000 motor cycles in service and possesses a greater number of manufacturing concerns than any other country in the world, the number of motor cycles in use in France does not exceed 50,000.

In endeavouring to explain this difference critics have frequently accused the French motor cycle manufacturers of a lack of initiative, or have placed the blame on the younger generation of Frenchmen for not assisting in the development of this movement. If the trouble were taken to enquire into the matter it would be discovered that neither the maker nor the user is specifically to blame, but that there exists such a train of natural circumstances that the use of motor cycles can never attain the degree of importance in France it has reached in England.

So far as cars are concerned, the difference is very slight. The returns for 1921 showed that there were 353,500 motor cars, lorries and hackney carriages in Great Britain—approximately one for every 136 persons. For the same period there were in France 293,770 motor vehicles of the same types—also one car for 136 persons. France has nearly 5,000,000 bicycles in use. No similar returns exist for England, but it is doubtful if this figure is attained. In view of the fact that the nations are so closely matched in the two extremes as cars and bicycles, it is all the more surprising that they should show wide differences in motor cycles.

Compulsory Military Service.

The statement has been made that the young Frenchman is not as frugal as his neighbour on the other side of the Channel, and on this account rarely saves up sufficient money to purchase a motor cycle. The fact has been overlooked that the Frenchman has to put in two years' military service on coming of age, during which time he receives practically no pay. Compulsory military service alone is largely responsible for the restricted development of the motor cycle movement. Housing conditions are a further handicap. In all the big cities flats are the general rule, and in consequence it becomes necessary for the Frenchman to keep his motor cycle in a public garage, with, as a consequence, extra expense and some restriction in the use of the machine.

French roads are far from being as suitable for motor cycling as the highways of England. Around such centres as Paris, Marseilles, Lille, Lyons, and other important cities, where the greatest numbers of motor cyclists ought to be found, such rough *pavé* exists that the use of a motor cycle for utility purposes is almost impossible, and the fact that this rough zone has to be crossed in order to reach good macadam roads acts as a deterrent.

Monotonous Main Roads.

France is not lacking in beauty spots, and as a touring ground is second to no country in the world. Few people, however, even in England, become motor cyclists merely for the pleasure of an occasional tour. The monotonous nature of the main highways of France, and the big distances which separate towns and villages, contribute to rob the daily use of a motor cycle of much of its charm.

Real lightweights are being developed primarily for utility purposes, and with a wonderful potential field among the five million cyclists of France they ought to be a permanent success. During the next few years there will probably be a very considerable increase in the use of lightweights, a development of the sporting side of motor cycling which will be the corollary of the general sporting revival throughout the country, and also an extended use of the cycle car.

One number plate must be illuminated as above *vide* Road Vehicles Registration and Licensing Order (1921). According to the Lights on Vehicles Regulations (1903) the lamps ordinarily required by law may be lit half an hour later.

Veterans.

How many machines of very ancient date, say, of 1906-8, are still in regular use?

Slack Club Men.

Why do some clubs "hibernate" during the winter months? The "villainous weather" excuse is apparently found very useful by apathetic members.

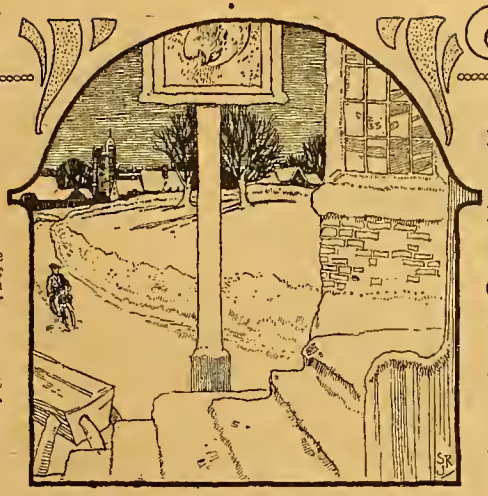
A Question of Averages.

Who makes the higher average on a long journey—the man who rides to a non-stop 28 m.p.h. or he who alternately covers a mile at full throttle and then pulls up to wipe his eyes or make a trivial adjustment?

News Item from Sweden.

Motor Cycle Club of Sweden recently arranged the great trial for the November Cup, 700 kilometres, day and night riding. All best riders taking part. Eric Westerberg, Harley-Davidson flat twin, won, taking home the cup for ever. Westerberg is a man to meet the best foreign riders when Sweden will arrange International six days trial in 1923.

We have to thank a Swedish correspondent for the above information, which, we think, the majority of our readers will appreciate more in its original form than had a sub-editor attacked it.



What to Wear.

Headgear is an unsatisfactory item in the motor cyclist's clothing—leather helmets render one deaf and caps have a habit of falling down over the face. All other forms being out of the question, the woollen "pudding basin" favoured by some competition riders seems to present the only solution.

Showing at Brussels.

At the Brussels Motor Show, which will be held from January 13th to the 24th, 1923, among the motor cycle firms exhibiting the following may be mentioned:—Gillet, Henderson, Sarolea, Ace, Omega, F.N., Roto-Sim (a Swiss edition of the Anto-Wheel), Peugeot, Harley-Davidson, S.L. cycle car, and Motosacoche.

More "Hints for Beginners."

How to make a tool roll—place it on the tank or saddle.

Ireland's Biggest Race.

Next year's Ulster Grand Prix will be held on September 15th.

Cycle Car Control.

Notwithstanding the decision arrived at by the meeting of the Association of Recognised Automobile Clubs, several Continental motor cycling organisations are continuing to cater for four-wheeled cycle cars.

All Sorts and Sizes.

The London-Exeter entry consisted of 95 solo machines, 90 sidecars, 14 three-wheelers, and 99 cars. In 1921 the numbers were: 72 solo, 110 sidecars, 18 three-wheelers, and 96 cars. 1920 saw 80 solos, 80 sidecars, 13 three-wheelers, and 64 cars, while in 1919 there were 40 solos, 67 sidecars, 1 scooter, 1 car.

New Record Rule.

One of the effects of the ruling passed at the last F.I.C.M. Congress in London that a machine in a smaller class might, owing to its superior speed, hold records in the class above it provided it conformed with the regulations regarding weight and size of tyres is that Colonel Stewart's records are thereby deleted in Class D and are held in that class, and Class C as well, by W. H. Sheraton (490 Norton). The same remarks apply to the records held by J. L. Emerson (496 Douglas).

THE SPEEDY MESSENGER. This young rider believes in combining business with pleasure for he uses his motor cycle in preference to a pedal cycle for the delivery of post office messages at Keighley.

Cars with Motor Cycle Performances.

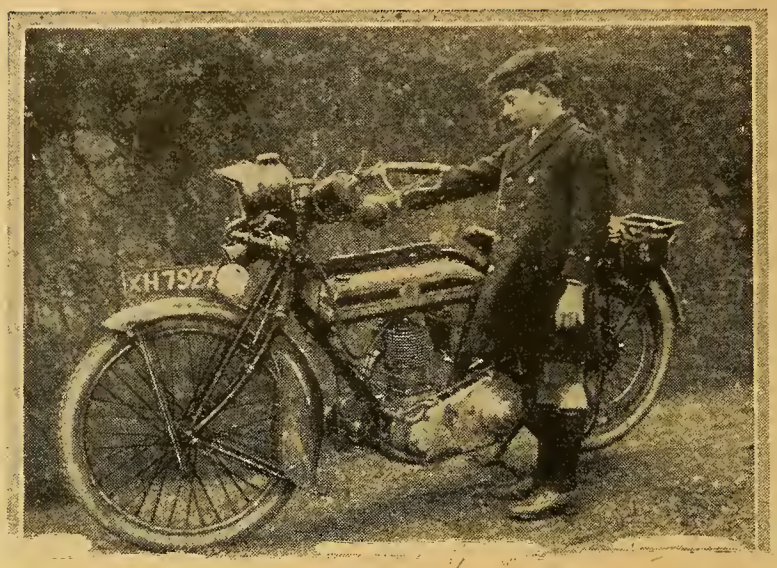
Even the keenest motor cyclist will confess an interest in cars, but usually he fails to be greatly aroused until the Bentley-Vauxhall class is reached.

Observations in the Dark.

In the interests of the long suffering press man we suggest that luminous numbers should be the order in trials including observed hills in the dark.

The Useful Lightweight.

Even in America the lightweight is not merely a runabout machine. It is now accepted as a serious touring mount, as will be appreciated from the photograph taken in the wilds of California on page 975 of this issue; the machines depicted are two-stroke Clevelands, a make not unknown in this country.



A YOUNG EXILE'S INTEREST. Prince Nicholas Galilzine, eldest son of Prince Vladimir Galilzine, regrets that the Triumph is of a size entirely useless for him at present.

Facts brought home.

One's enthusiasm for the economical motor cycle increases when it is found necessary to pay over two or three pounds sterling for the privilege of riding in a crowded railway train because the 1922 machine has been sold and the 1923 model has not been delivered.

Over 1,000 Pages.

There are over 1,000 editorial pages in the volume of *The Motor Cycle* (June to December) which this number completes.

Good Spirits.

Alcohol has always exercised a great power in making glad the heart of man. Motorists wonder when the time will come for it to be the chief source of power also in transporting them to and from their scenes of merry-making.—*The Autocar.*

The Repentant Policeman.

A motor cycling policeman has joined a flourishing club. Previously he had successfully "operated" against several members for various offences.

A Royal Motor Cyclist.

Prince Leopold of Belgium, an enthusiastic rider of an American X, will open the next Belgian Motor Cycle Exhibition

Luminous Gloves for Policemen.

So as to allow the signals of constables to be clearly seen, the police authorities at The Hague have supplied their men who regulate the traffic with luminous gloves. A small electric lamp is fixed in the centre of the palm. The light goes out as the constable lowers his hand.

Hobbies Require Careful Mixing.

An enthusiastic angler used his sidecar to carry home his haul of six pike. Later, in the evening he motored his fiancée to a dance. They left early, and with the money he had saved for a dynamo lighting set he is paying for a new dress and the cleaning of an expensive fur coat.

Comfort-loving Southerners?

With reference to the discussion about North and South country riders, it has been pointed out that, although there are comparatively few London motor cycle manufacturers, more spring frame machines have originated from the metropolitan area than from all the rest of the country.

Motor Cycle for Fire Fighting.

The latest addition to the fleet of motor vehicles in the Bloemfontein Fire Brigade is a Harley-Davidson sidecar outfit.

Beyond all Hope.

We do not know whether the following, overheard at a trial, were responsible for the disqualification of the two competitors concerned:

"Why did the watersplash?"
"Because it saw the hill climb."

When did the Valve Spring?

As soon as it saw the flywheel and felt the valve tappet.

Mud Splash Problem Not Yet Solved.

The R.A.C. judges are unable to recommend any awards as the results of the recent splashguard tests at Hendon.

Countisbury Hill.

An alternative road to Countisbury Hill is suggested by the Chairman of the Barnstaple Rural District Council.

Mr. A. I. Greenwood, of Leeds, who has ridden motor cycles since the days of the front driven Werners. The machine shown is a Singer of about 1898, with the engine in the rear wheel.

EARLY DEVOTEES OF THE PASTIME.

Mrs. Harry Reed and the Dot motor cycle which was specially made for her in 1908. Mrs. Reed was one of the first ladies to take up motor cycling as a pastime.

Contradicted.

Stranded rider (on Christmas Eve): Oh, —— this magneto, Oh ——— —— * * * ! ! !

Voices of carol-singers in distance: "No-el, No-el."

Police Activity at Matlock.

Indifferent roads and police persecution are given by various readers as reasons for avoiding Matlock.

Speed Tests in Selling Trial.

For the Worcester Spring Selling Trial the organising clubs have secured from their patron, the Earl Beauchamp, the use of the drive at Madresfield Court for high speed and low gear tests.

Applause from a Strange Quarter.

When the Ulster Grand Prix was being run (according to a correspondent to the *Children's Newspaper*) the noise of the machines in the distance was so like the croaking of frogs that a local frog joined in the chorus—quite out of season, too.

Record Entry.

Three hundred and eight was the record number of entries received for the M.C.C. Boxing Night run to Exeter from Staines and back again. In 1919 the total number was 109; in 1920, 237; and in 1921, 216. The best pre-war entry was in 1914, when the total was 231.

Popular Initials.

A French contemporary laughs at the British fashion of naming machines by initials. After quoting A.J.S., P.P., P.V., G.S.D., H.B., J.E.S., H.T., P.M., B.S.A., O.K., J.D., it goes on to say "Here is practically the whole alphabet!"

Prickly Freight.

For at least a fortnight before Christmas day nearly every week-end sidecar drivers might have been seen proceeding homeward with a heavy burden of freshly-gathered holly or mistletoe.

The Answer.

Novice wheels silent machine into garage.

Proprietor (diagnosing trouble): "Has this been to any other garage-man?"

Novice: "Yes."

Proprietor: "And what did the silly fool tell you to do?"

Novice: "To come to you."

(Collapse of proprietor.)

THE COMPETITION RIDER'S HOLIDAY! En route on the M.C.C. annual Christmas run to Exeter and back. As we go to press 185 solo riders and sidecarists are wending their way to Devonshire. The event will be reviewed in next week's issue of "The Motor Cycle."

MOTOR CYCLES FOR ALL PURSES.

In addition to the Extensive List of 680 1923 Prices which appeared in our issue of December 14th are the following Figures, which brings the total to upwards of 700.

SOLO MACHINES.

£30 9s., Coventry Eagle, 142 c.c., T.S., single spd.

£33 12s., Coventry Eagle, 142 c.c., T.S., 2 spd.

£35, J.D., 116 c.c., T.S., single spd., C.

£38 17s., Hack, 103 c.c., T.S., single spd., C.

£56, Coventry Eagle, 249 c.c., 2 spd., K.S. and C.

£56, Coventry Eagle, 293 c.c., 2 spd., K.S. and C. (J.A.P. model).

£65, H.T., 348 c.c., 2 spd., C.

£65, Coventry Eagle, 348 c.c., 3 spd., K.S. and C.

£65, Bradbury, 350 c.c., 3 spd., K.S. and C.

£67, Coventry Eagle, 346 c.c., 3 spd., K.S. and C.

£69 10s., Coventry Eagle, 346 c.c., 3 spd., K.S. and C. (sports model).

£75, P. and P., 349 c.c., 3 spd., K.S. and C.

£80, H.T., 349 c.c., 2 spd., hand starter and C.

£85, Rover, 249 c.c., 3 spd., K.S. and C.

£90, Brough, 692 c.c., 3 spd., K.S. and C.

£95, Rover, 499 c.c., 3 spd., K.S. and C. (sports model).

£95, Bradbury, 749 c.c., 3 spd., K.S. and C.

£100, Brough, 496 c.c., 3 spd., C.

£100, Rover, 499 c.c., 3 spd., K.S. and C.

£115, Rover, 654 c.c., 3 spd., K.S. and C.

£125, Coventry Eagle, 976 c.c., 3 spd., K.S. and C.

PASSENGER MACHINES.

£80, Melen, 297 c.c., T.S., 3 spd., K. S. and C., box carrier, three-wheeler.

£86, Coventry Eagle, 346 c.c., 3 spd., K.S. and C., with sidecar.

£97 10s., P. and P., 349 c.c., 3 spd., K.S. and C., with sidecar.

£115, Coventry Eagle, 549 c.c., 3 spd., K.S. and C., with sidecar.

£120, Brough, 692 c.c., 3 spd., K.S. and C., with sidecar.

£122 8s., Bradbury, 749 c.c., 3 spd., K.S. and C., with sidecar.

£125, Rover, 499 c.c., 3 spd., K.S. and C., with sidecar (sports model).

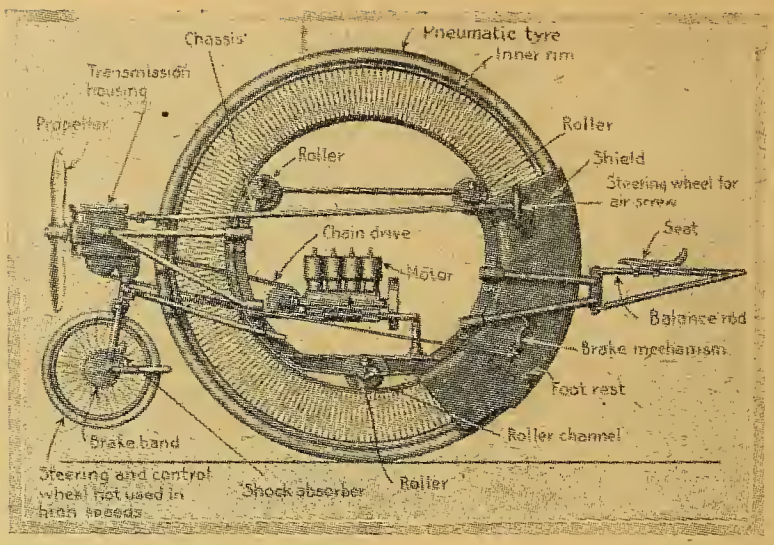
£130, Rover, 499 c.c., 3 spd., K.S. and C., with sidecar.

£145, Coventry Eagle, 976 c.c., 3 spd., K.S. and C., with sidecar.

£145, Rover, 654 c.c., 3 spd., K.S. and C., with sidecar.

UNICYCLES OF TO-DAY AND LONG AGO.

Italian Designer Revives Interest in the Single Wheel Motor Cycle. Is it Practicable?

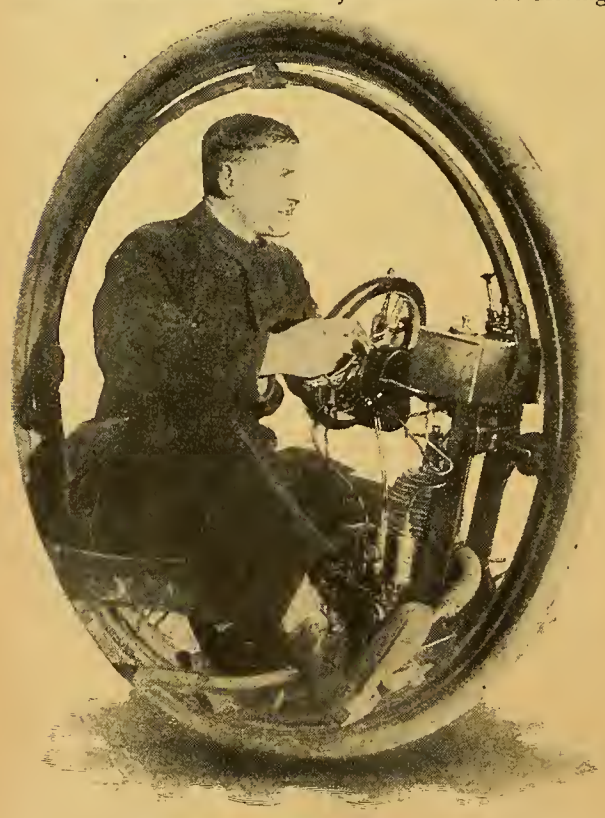


Great things were anticipated from this design.

"WHY should motor cycles have *two* wheels?" asks an Italian inventor; and, presumably without waiting for a reply, he designs the weird "unicycle" illustrated below.

As far as can be gathered, the rider and engine unit are suspended in an inner circle, as it were, making contact with the outer rim by rollers. One of these rollers is driven by the engine, the transmission being of the friction pattern.

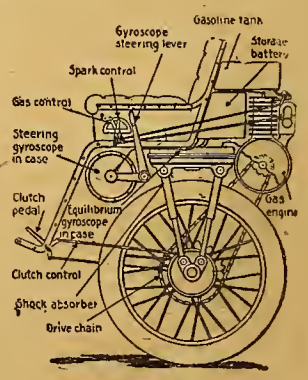
How steering is effected is not clear, but obviously the steering wheel is mere camouflage. Mudguarding will also present a difficult problem; and one does not care to visualise the effect of a jamb between the driving and driven transmission members when the vehicle is speeding hard down-hill!



The latest Italian one-wheel motor cycle.

The idea, however, is by no means new. A motor unicycle, hailing from America, was described in *The Motor Cycle* of April 4th, 1918. It consisted primarily of an enormous wheel, nine or ten feet in diameter, propelled by an air-screw, the motive power for which was supplied by a four-cylinder engine.

Another and more practicable invention of a similar nature was described in *The Motor Cycle* at the same time; here the rider was seated in a chair surmounting a wheel three or four feet in diameter. The whole was maintained in an upright position by an electrically-driven gyroscope, while a smaller gyroscope operated the steering through bell-crank levers. Imagine the driver's plight in the event of a sudden failure of the current!



Gyroscopically balanced American model.

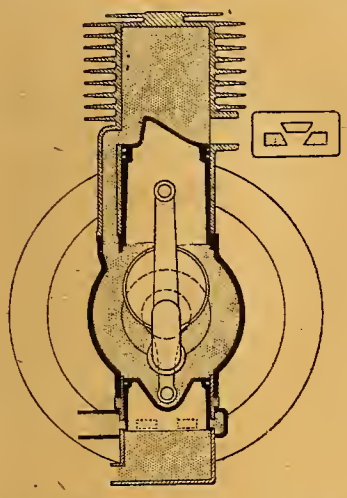
On July 4th, 1919, there was described in *The Motor Cycle* yet another example of the single-wheeled motor cycle, invented by a Mr. E. J. Christie, and patented in the United States. A working model was constructed, which bore out the inventor's claims and theories in a satisfactory manner. A large wheel, flanked on either side by a smaller one, contained an electrically-driven gyroscope. When stationary the machine rested on one of its side wheels, but righted itself when the gyroscope commenced to revolve. A speed of 540 m.p.h. was anticipated.

Just as we go to press details come to hand from a reader (Mr. G. S. Knox) of the absolute father of them all. His sketch, from an American paper of 50 years ago, shows a venerable gentleman sitting in a handle-propelled wheel constructed of wood.

SUPER-CHARGED TWO-STROKE.

EVEN the keenest two-stroke adherents have to admit that there is less possibility of change and less scope of experimental ideas in the type of engine which they favour than in the more complicated four-stroke.

Doubtless mechanical complication, or rather, increase in the number of working parts, will be inevitable if the two-stroke is to be much further developed, for



Increased crank case capacity is obtained in the Cross two-stroke design by a supplementary pump piston.

surely the simple three-port "valveless" type of engine must have reached almost to the limit of efficiency, especially in the smaller sizes.

Improving Scavenging.

A Lancashire designer (Mr. J. D. Cross) has approached the two-stroke problem with the object of super-charging and better scavenging of the exhaust, even at some increase in the number of reciprocating parts

He proposes to increase the volume of his crank case charge by a second and subsidiary piston working in opposition to the main piston. This piston is operated by eccentrics and short connecting rods, and may lie directly below the main cylinder, or, in the case of a horizontal engine, directly opposed to it.

It functions as an inlet valve, uncovering ports in its cylinder, and by carefully proportioning the subsidiary piston it is possible to obtain an increased charge of mixture for use in the working cylinder.

Advantages Claimed.

It might be thought at first that the extra piston would be better employed as a second working piston, but the designer points out that in this case one would obtain only two low-efficiency cylinders instead of one, which is more likely to function regularly even at low speeds and small throttle openings, whereas it is not necessary to construct so long an engine in the case of his design. Also, it is an extremely difficult matter to produce a satisfactory ignition for an opposed twin two-stroke, and in any case such an engine would produce two explosions at the same time and have no better torque than a single cylinder engine of the same capacity.

Large Crank case Charge.

The diagram shown is self-explanatory. The lower, or pumping, piston, when at the bottom of its stroke uncovers inlet ports, and, since it moves outwards at the same time as the working piston, a large charge is drawn into the crank case. This charge is transferred through to the combustion head when the main piston drops below the transfer port.

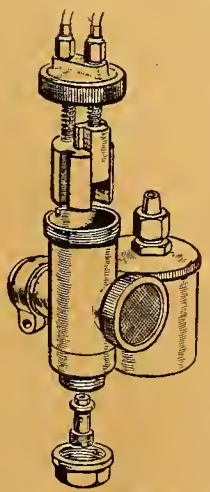
In addition to this, Mr. Cross has evolved an unusual system of exhaust ports, also shown on the diagram, in which he finds that it is necessary only to connect the upper port to the expansion chamber of the silencer, while the pipe from the lower ports enters the silencer tail pipe.

MINIATURE B. AND B. CARBURETTER.

DESIGNED to meet the demand for an efficient carburetter for use on ultra-lightweight machines, the "Baby" B. and B. is an interesting addition to a growing class.

It is a two-lever instrument of simple design, and, although of tiny proportions, is designed to allow the engine to develop full power under all conditions.

Another innovation by the same makers is a twist grip handle-bar control. It is composed of two sleeves, the inner sleeve, which is slid over and is rigid with the handle-bar, has a quick pitch worm formed on its periphery; this worm engages a similar one on the inner side of the outer sleeve. Into the inner sleeve is fitted a block which forms a cable stop and an anchorage for the wire; the end is closed by a screwed cap. This control was illustrated recently "Among the Accessories"; it is, of course, intended for single-lever carburetters.



New Miniature B. and B. Carburetter.

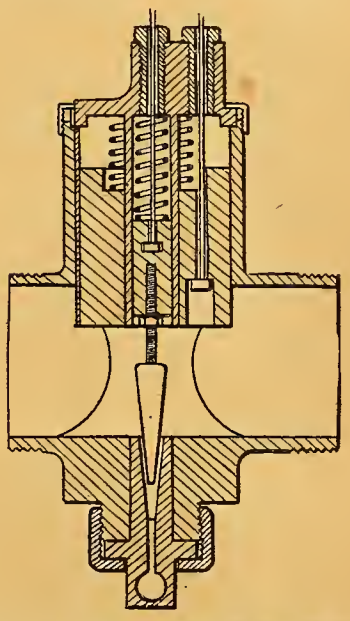
All the well-tried models of B. and B. carburetters are retained for 1923; these include pilot jet and single jet instruments, and a special model for two-strokes. Minor improvements only have been effected, all models being substantially the same as in 1922.

SIMPLE VARIABLE JET CARBURETTER.

AS a result of much experimental work a very simple carburetter has been constructed by Mr. J. T. Bradford, of Colne, Lancashire.

In broad principles it is very straightforward, since the main tube is closed or opened at will by a specially-shaped throttle barrel working vertically in a normal manner through Bowden controls.

This single slide controls both air and gas proportions, and it surrounds a central tube wherein works a plunger to which is attached a taper needle. This taper needle seats in a correspondingly tapered jet tube and can be raised or lowered at will through a second hand control. Thus it is possible to adjust the size of the jet orifice to any given conditions, and consequently no external alterations are required to suit changes in atmospheric pressure or temperature.



Section of Bradford carburetter showing the construction of the handle-bar controlled adjustable jet and the combined throttle and air barrel.

Special Controls.

It has been found that special control levers are necessary to obtain the best results with this carburetter, and, though these are equally as convenient as the ordinary type, they differ slightly in detail. We are informed by the designer that it is possible to obtain a consumption of 110 miles to the gallon regularly at normal touring speeds on a 550 c.c. Triumph, and mileages of 128 have been obtained on a gallon of spirit under favourable conditions.

A simple carburetter of this description with a handle-bar controlled jet should be suitable for most types of machines, but perhaps especially for two-strokes where a wide range of jet orifices is required for varying conditions of load.

"THE MOTOR CYCLE" FILM.

Enthusiastic Reception in Cornwall. Propaganda Value in the Midlands.

AN excellent reception was accorded the southern film at the Launceston Picture Theatre, where it was shown by the Dunheved (Launceston) and District M.C. A number of enthusiasts spent a very pleasant time watching the pictures.

Special interest was taken in that portion of the film depicting the climb of Beggar's Roost in the London-Land's End trial, especially as a local man was among the riders. The film proved that the views of the competitors, expressed when they reached Launceston, as to the surface of the hill were not exaggerated. At the conclusion of its report, the Dunheved Club states that it is hoped to make a bigger thing of the film next year.

Heavy Winter Bookings.

So far as the booking of dates is concerned, these have been very heavy for January, as for the past month, and February is a fairly busy month; but bookings have not been nearly so frequent in the case of the film which is circulating in the South as of that which is touring the North; for the latter there is hardly a vacant date right up to the middle of March. It will be on view for three days in the Isle of Man.

The Shirebrook M.C., in acknowledging the receipt of the film from Edinburgh, mentions that members turned up in force and were joined by some of the Mansfield M.C. and L.C.C. The exhibition was heartily enjoyed by all. The secretary states that there is no possible doubt but that the trials and T.T. portions of the film are particularly instructive to the non-motoring public. For instance, when Bennett's speed and the distance of the Senior T.T. were shown on a sub-title a spectator remarked that he thought it was wonderful for a motor cycle to stand the strain of 226 miles at 58 m.p.h., as he never thought it possible on ordinary roads.

Interest of Trade and Public

A grateful letter has been received from the Stafford and District M.C.C., the secretary of which writes:—"The film was pronounced a great success by all present, and all the Stafford enthusiasts agreed that it was of the greatest benefit both to clubmen and to the trade. The film must prove even to the greatest sceptic that the motor cycle is one of the most tested and tried productions on the British market." At the conclusion of the exhibition votes of thanks were accorded to the proprietors of *The Motor Cycle* and to Councillor Everton, president of the club.

Where the Southern Film is shown next week.

THURS.-SAT., DECEMBER 28th-30th.—Norfolk M.C. and L.C.C., Theatre de Luxe, St. Andrews, Norwich.

TUESDAY, JANUARY 2nd.—Loughborough and District M.C.C., Club Hqrs., Loughborough. (1921 film also.)

WEDNESDAY, JANUARY 3rd.—Bedford and District M.C.C., The Palace, High Street, Bedford.

THURSDAY, JANUARY 4th.—St. Albans and District M.C.C., The Empress Cinema, London Road, St. Albans.

The Northern Programme.

FRIDAY, DECEMBER 29th.—The West Bromwich and District M.C. and L.C.C., Imperial Picture House, Ltd., West Bromwich.

SATURDAY, DECEMBER 30th.—The Bolton Mission, King's Hall, Bolton.

SUNDAY, DECEMBER 31st.—The Barrow and District M.C., Salthouse Pavilion, Barrow-in-Furness. (1921 film also.)

MON.-WED., January 1st-3rd.—The Goldthorpe and Thurnscoe M.C.C., The Goldthorpe Empire.

IMPORTANT 1923 CONTINENTAL EVENTS.

AMONG the many races to be held during 1923 in France and on other parts of the Continent, the most important will be the Grand Prix organised by the *Union Motocycliste de France* on the Tours course, on June 24th. This race, which is combined with the French Grand Prix car races, and has the advantage of the elaborate preparation made for these events, is the blue riband of the Continent and is open to machines of 250, 350 and 500 c.c.

Road Races.

A speed championship has also been arranged, which comprises the race at Tours and four other events: the *Motocycle Club de France* Grand Prix on July 22nd and 23rd; the Lyons Grand Prix race on May 10th; the Bol d'Or 24-hour race to be held near Paris between May 17th and 23rd, and the Marseilles road race on June 17th. The rider making the best performance in these five events becomes the speed champion of the year.

In the same way there is a touring championship comprising six events, the first being the Paris-Nice reliability trial on February 16th to 19th. This run is followed by speed trials and a hill climb up La Turbie which do not figure, however, for the championship. Next comes the U.M.F. one-day trial, which doubtless will be a non-stop run in the Forest of Marly, near Paris, on March 25th. The *Tour de France* organised by the *Motocycle Club de France* from April 17th to May 6th will also count, the other three events being the Vosges circuit on May 21st, the Bordeaux to Royan trial on August 12th, and the Autumn circuit at Toulouse on September 23rd. The touring championship is open to motor cycles, sidecars, and to cycle cars, for this latter class of machine still comes under the control of the U.M.F.

The trial from Paris to the Pyrénées and back has been scheduled for June 17th to 24th, at which date it is practically certain the passes will be free of snow.

More important of course than the French trials, from an international standpoint, will be the International Six Days Trials, from August 6th to 12th, already referred to in *The Motor Cycle*.

At the Monza Track.

While the full Italian programme has not been announced, the most important event in that country appears to be the *Grand Prix des Nations*, for 500 and 1,000 c.c. machines, to be run on Monza track, near Milan, on September 8th. Other events on the Italian track will be a sidecar and cycle car race on April 29th, and a 24-hour race, with two riders per machine, on June 24th and 25th. There is a project for a reliability trial from Paris to Rome during the summer of 1923, but details of this have not been decided on.

Belgium will have its Grand Prix road race on July 15th, and on November 6th there will be a Spanish Grand Prix at Tarragona.

OVERSEAS TRADE.

IN order to obtain the latest information regarding the state of overseas markets, we took the opportunity of calling on Mr. Norman Hill, of the Coventry Chain Co., Ltd., who has just returned from a long business voyage.

After visiting Australia, New Zealand, Malay States, Dutch East Indies, the Argentine, Brazil, China and Japan, Mr. Hill gained the impression that, though there is an almost universal desire to buy British motor cycles, yet our products are entirely swamped by American goods. The reasons to which he attributes this fact are that our prices are too high, we have very inadequate spares service, and that, owing to American propaganda, only big twins are saleable in the majority of overseas markets.

Of the countries visited, only Australia and New Zealand show any considerable signs of trade revival, and we were asked to emphasise the fact that the two are separated by 1,200 miles, and therefore each requires a separate sales and service depot.

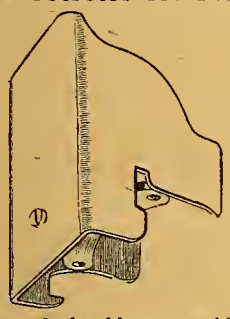
In confirmation of the opinion expressed by Mr. George Stevens, Mr. Norman Hill is emphatic as to the needs of travel for our responsible business men, who can only learn by first-hand experience the difficulties and requirements of overseas buyers.

AMONG THE ACCESSORIES

Anti-dazzle Goggles.

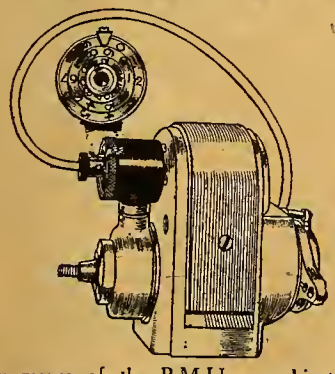
Dazzling head lamps lose their terror to those who wear the latest edition of the C.G.P. eye-screen (for attachment to helmet or peak of cap), which has an additional screen of a specially tinted material. 4s. 6d. and 5s. (P. G. Cambray, Engineer, Long Preston, S.O., Yorkshire.)

Valve Protector for Nortons.



Specially made for Norton machines, this neat aluminium valve guard is marketed by Herbert Robinson Ltd., 32-35, Green St., Cambridge.

For Locking the Ignition.



By means of the B.M.I.L. combination lock the magneto may be short circuited, and except by changing the magneto, the would-be thief is completely foiled. The inset shows the lettered face of the lock. (T. Armstrong Carter, 16 Green St., Leicester Sq., London, W.C. 2.)

Serviceable Bulb Horn.

Compactly built and finished in black, this bulb horn is representative of a wide F.R.S. range of these fitments. (F.R.S. Lamps, Beam Works, Vere Street, Birmingham).

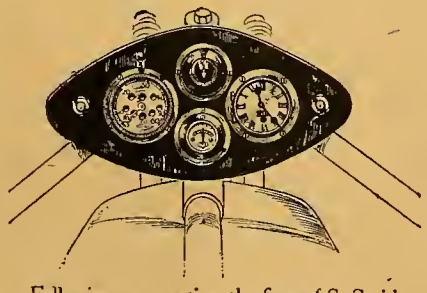
Non-slip Handle Grips.

Galirub handle-bar grips are made of rubber moulded to the imprint of a hand, so that a very comfortable grip is afforded. 3s. 6d. per pair for ⅞ in. or 1 in. handle-bars. (Gallite & Rubber Manufacturing Co., Ltd., Burlington Road, Fulham, London.)

Driving Mirror on Cap.

In appearance like a cheap tie clip with a tiny mirror hinged thereto, this patented device is a miniature driving mirror for attachment to the peak of the rider's cap. It acts quite well provided the cap does not jolt about too much. (J. Smith, 40, Upper Arcade, Bristol.)

Instrument Board for Motor Cycles.

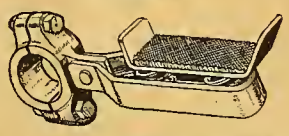


Following car practice, the firm of S. Smith & Sons, Ltd. (Cricklewood Works, London, N.W.) has introduced an instrument board for motor cycle handle-bars. It is priced at £2 10s.

Universal Box Spanners.

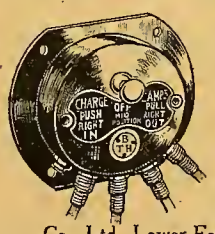
Six different sizes of nuts are fitted by the Hamilton nest of box spanners which are coupled together as shown and normally need no tommy bar. (Hamilton & Co. Ltd., Anniesland, Glasgow.)

Spring Footrests for Pillion Riders.



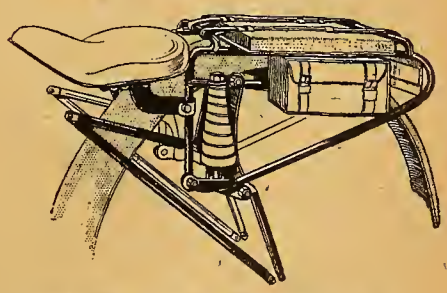
Spring footrests for pillion riders have been introduced, at 7s. 6d. per pair, by Herbert Terry & Sons, Ltd., Redditch.

Convenient Lighting Switch.



On the new B. T H. mag-generator a particularly neat switch is fitted, which may easily be manipulated by touch without the necessity of the rider peering down to see what position it is in. (B. T. H. Co., Ltd., Lower Ford Street, Coventry.)

Spring Saddle and Carrier.



Saddle and carrier are sprung together in one X-L-All design, eminently suitable for transporting fragile goods, or for use as a pillion seat. (John Leckie, Ltd., Walsall.)

THROUGH FEMININE GOGGLES.

Suitable Costumes for Wear both On and Off the Machine.

By A WOMAN MOTOR CYCLIST.

A summer-time riding costume. Miss Lempriere, of Jersey, daughter of Mr. R. B. Lempriere, the Seigneur of Rozel, is an enthusiastic owner of a New Hudson two-stroke.

THAT a woman should have to dress as a man to ride a motor cycle is an entirely mistaken idea. I often find that the sole reason for not taking up the healthy, inexpensive and exhilarating hobby of motor cycling is "because I should have to wear breeches." This is not early Victorian modesty, the point being that the possessor of a motor cycle would naturally use it for long rides, from London to the sea, or from a remote country village into a fashionable town. *En route* one would be all right, but what woman, even in these days, would face the parade of a smart watering place, or the shopping centre of a fashionable town, clad in breeches?

Riding Kit must Suit Walking.

It will be argued that a change could be carried in a suit case on the carrier; for a whole day this idea would be feasible, but a whole day at one place would not be a general rule. A couple of hours listening to the band; looking round a new place; shopping; or just lunch or tea at a cheerful *café*—these may be the objects of a ride, and to "change" would make far too great a business of the whole affair. On a tour, where several places are visited in one day, it would be ridiculous, to say nothing of the expense of hiring a room to change in.

With the right motor cycle, however, this dress drawback does not exist. I do not say that one could ride 50 miles and then compete with success in a fashion competition with a lady who had just walked 50 yards from her hotel; but I do say that, with care, one can mix with quite fashionable civilisation without feeling or looking out of place.

Low Built Machine Essential.

I have just completed 12,000 miles on a two-stroke lightweight machine. This is a man's model, but built low, which enables an everyday medium-length skirt to be worn with the same appearance as a longer one on an ordinary bicycle; the width round the bottom, however, should not be less than 70in.

My costume for short ordinary or long country non-stop rides, in the summer, is an old sports coat and skirt, too shabby for ordinary wear, but which look quite smart on a motor cycle; while for civilised jaunts, anything to suit the occasion, entirely covered up by an ample belted coat of leather or khaki cotton drill, according to the weather, with the collar turned up to keep out the dust.

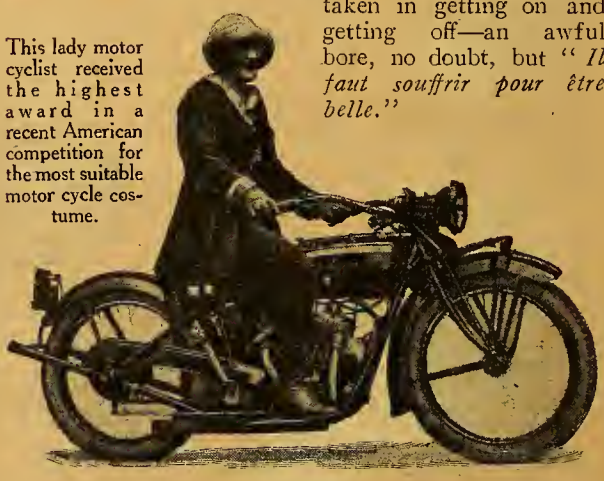
Foot-wear and Head-gear.

Dust and rain-proof leg-guards are a special feature of many modern machines; but a stray spot of oil might be damaging to smart stockings, so it is advisable to wear an extra pair, or gaiters, just for the journey. Any shoes can be worn, provided they have not too high heels, which cause difficulties in starting and brake manipulation.

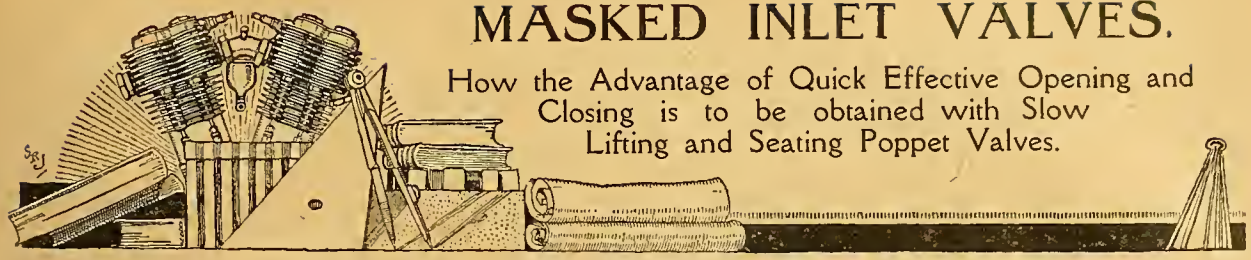
Preferably the hat should be of the pull-on tight-fitting variety, but if it is windy and there is any doubt as to its keeping firmly on, a leather strap or scarf must be wound tightly round it. This is important, as hatpins are dangerous, and having to grab at one's hat while going round a corner or at a critical moment in traffic may mean a nasty accident. For ordinary occasions nothing can beat a leather helmet strapped over the ears; it drowns the noise of the engine, so adding greatly to the enjoyment of riding, and, with a fur lining, is delightfully snug in the winter.

Leather gauntlet gloves should be worn, and a stout mackintosh and sou'wester must always be kept strapped on the back carrier in readiness for wet weather.

It must be remembered that when the rider is dressed "for show" the machine must be clean to start with, especially over the top tube and petrol tank, where the under part of the front of the skirt rests; also, the very greatest care should be taken in getting on and getting off—an awful bore, no doubt, but "*Il faut souffrir pour être belle.*"



This lady motor cyclist received the highest award in a recent American competition for the most suitable motor cycle costume.



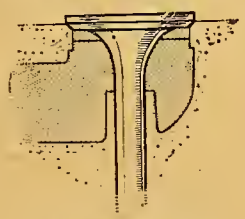
MASKED INLET VALVES.

How the Advantage of Quick Effective Opening and Closing is to be obtained with Slow Lifting and Seating Poppet Valves.

By "DUMB IRON."

THE term "valve masking" is unfamiliar to quite ninety per cent. of motor cyclists, although the idea it expresses was originated as long ago as 1905 by the German firm of Adler. It is not surprising that, in the days when mechanical inlet valves were by no means universal practice, the idea came to naught. Since then it has been, with very few exceptions, ignored by designers and journalists alike. It has been resuscitated at times, its most recent adherent being H. R. Ricardo, the designer of the four-valve Triumph engine.

The masked valve is, to some extent, a combination of poppet and sleeve valve. It differs from the standard poppet valve inasmuch as it has to rise some distance from its seat before gas can enter the cylinder. The "mask" cuts off the first part of the lift.

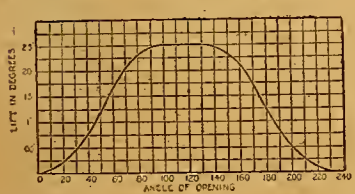


An ordinary poppet valve with seating on the surface of the valve pocket.

Before one can understand the advantages of this system, it will be necessary to recall to the reader's mind some facts concerning cam-contour and gas-lag, and the reason for "overlap."

A cam must lift the inlet valve in such a way as to allow the maximum amount of gas to enter the cylinder, with the minimum amount of jar and noise from the cam-gear. On a racing engine, where silence and longevity do not matter so much, "quick-lift" cams are employed; but on a touring or sporting engine the valve must leave its seat and return to it as slowly as possible, if noise and rapid wear are to be eliminated.

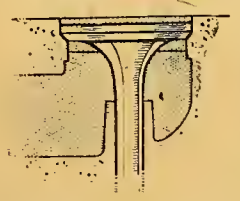
Examination of an average lift diagram will reveal that the valve lifts from, and returns to, its seat gradually. It is important to remember, though, that at 3,000 revolutions per minute the inlet stroke has to be completed in $\frac{1}{100}$th second, and during this very short time the valve must (1) leave its seat, (2) accelerate, (3) decelerate, (4) be brought to rest at maximum lift, (5) accelerate downwards, (6) decelerate, and (7) be brought to rest again on its seat.



Valve lift diagram of a standard engine, showing small amount of lift during earlier stages of crank revolution

Overlap and gas-lag must now be considered. On an average touring side-by-side valve engine the inlet valve opens at top dead centre, so that as soon as the piston begins its move down, it shall suck in gas. Just before the piston has reached the top it had begun to slow down, but the exhaust gas which it was pushing out continued its rush from the cylinder. In order to take full advantage of the momentum of the exhaust gas, and to prevent any part of it being trapped in the cylinder, *the exhaust valve is allowed to remain open for 20° after the inlet valve has opened.* By this means, both valves are open at once, and the exhaust is continuing to leave the cylinder under its own momentum, after the piston has commenced to move down and suck in new mixture.

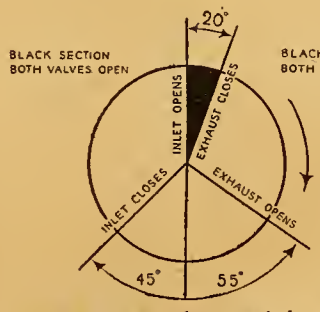
There is a similar "gas-lag" at the bottom of the inlet stroke, and it has to be allowed for once again.



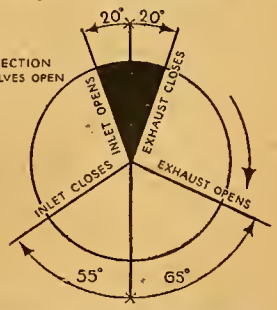
The seating of a masked valve is in a recess in which the head is a sliding fit, combines sleeve and poppet valve characteristics.

That is to say, the inlet valve allows mixture to continue to rush into the cylinder even after the piston has commenced the rise for the compression stroke. The inlet valve shuts just before the mixture's momentum has been arrested, thus preventing "blow-back" through the carburetter, but it must be remembered that gas momentum varies with engine speed; valve timing does not.

Now let us consider the state of the inlet gases at the overlap point, *i.e.*, at the beginning of the inlet stroke. Since the inlet valve must open slowly, several degrees of crankshaft rotation will have occurred before the opening is effective. If we try to make sure of an effective opening at top dead centre by opening the inlet valve early, we shall risk a "blow-back" at slow speed with its waste of valuable fuel. It will be seen, therefore, that blow-back can be caused by too early opening, as well as by too late closing.



Timing diagram of a typical touring engine.

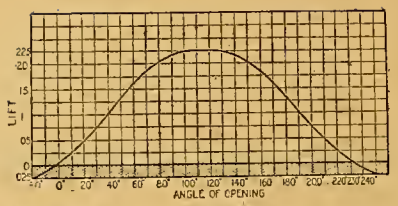


Excessive overlap and extended inlet period on a racing engine.

Masked Inlet Valves.—

In the case of a racing engine it will readily be seen that, where speeds are high, the momentum of the gases is such that considerable overlap can be allowed. Furthermore, even if slight blow-back does occur, it is of little consequence on a racing engine where economy of fuel is of little moment.

We are therefore forced to the conclusion that an engine which is designed and timed for high speeds is liable to be very wasteful at low speeds or when running free.



Lift diagram of a masked inlet valve (the shaded part of the diagram represents the mask). While the mask is only ·025 in. deep it is equal to 20° of crankshaft rotation. It will be seen that the lift is nearly double in the second 20° to that obtained in the first 20°.

Is it possible to design a cam gear which shall be suitable at all speeds? Variable timing is impossible in the restricted space available on a motor cycle engine. It is obvious that we can only fulfil all the conditions for high and low speeds if we can obtain a valve which shall occupy no space of time whatsoever in opening and closing. With such a valve it would not be necessary to open before top dead centre to ensure an effective opening at that point, because we are presuming that effective opening is instantaneous. Similarly, at the bottom of the inlet stroke we could close the valve at 20° to 30° after bottom dead centre instead of allowing 55° of crankshaft rotation to give the valve time to return to its seat.

Is there a system of valve design which will allow of a close approximation to the above ideal state of affairs? Can we have good power at 5,000 r.p.m. and economical running without blow-back at 250 r.p.m. with a timing diagram such as that of a typical sports engine?

It will be seen, by reference to the diagrams, that with an ordinary cam gear the amount of lift for the first 20° is about half the amount for the second 20°. If, therefore, we open the valve 20° too early, and "mask" off that slow first 20°, the valve will open with tremendous rapidity just at the desired point, and effective opening will occur as nearly instantaneously as possible. Similarly the valve can close with great rapidity at 30° after bottom dead centre, and the "mask" will allow it to return to its seat gently for 20° of the crankshaft rotation, after the inlet passage has been closed by the cylindrical portion of the head.

In brief, we can ensure silence and longevity by allowing the valve to accelerate and decelerate slowly, and by "masking" this ineffective part of its travel. To be effective, the mask and the valve must be made to extremely fine limits both as regards diameter and depth.

CLEANING A MOTOR CYCLE.

Thoughts and Suggestions on the Removal of Travel Stains.

EVEN in this age of abandonment it is neither necessary nor desirable to dispense altogether with the formality of cleaning motor cycles.

As a general rule the motor cycling community may be divided into two classes: (1) those who clean their machines once a week or more, and (2) those who perform the ceremony about once in every twelve months. And yet, did one but realise it, most of these are of the same opinion on one point.

"Life," they say, "is too short to permit of hours being spent in cleaning a machine. Tell us a rapid yet effective method of doing it, and then it will be done more often."

Mud left to cake on the machine indefinitely will eventually have a corroding effect on the enamel, and after that has occurred no amount of cleaning will restore the original condition.

The best preliminary advice to the novice is that he should procure an abundant supply of paraffin, which is invaluable in removing congealed oil, slight rust, and other things; a quantity of soft rags will also be needed.

If the machine is in a bad state it is advisable to sponge the whole outfit down with paraffin, soaking off the mud as far as possible without injuring the enamel. If rust has accumulated on any of the plated parts, clean them well with paraffin first, then dry them and cover with a film of vaseline or other suitable grease. The crank case and gear box should be brushed hard with paraffin.

When this has been done, perhaps the most efficient way of entering upon the next stage is with the assistance of a hose. A stream of water under pressure will work wonders in removing mud and dirt, especially in places not easily accessible with the rag or sponge, while its effect on paraffin-washed aluminium is wonderful.

The upper part of the machine, such as the lamps, handle-bars, tank, and saddle, should be subjected to special treatment at the discretion of the owner, but the remainder of the frame and the engine will benefit considerably by a free use of the hose.

After the water has dried off to a certain extent, the machine should be rubbed over with a cloth until properly dry, and finished off with a soft leather or cloth.

Some riders will say that they never bother about cleaning their motor cycles; they may always be detected by the condition of their machines. There is a subtle distinction between the dirt of several hundred miles and the filth of many thousand, and there is little doubt that an occasional "spring clean" forms an important factor in the length of service of the machine and its efficiency, quite apart from its actual appearance on the road.

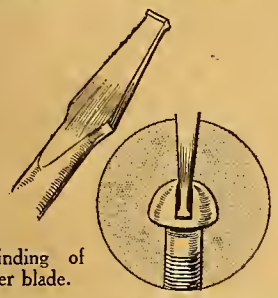
It must be strongly emphasised that it *does* pay to keep a machine reasonably clean, and this can be done without any great trouble, provided that plenty of rags, a brush or two, and a quantity of paraffin always form part of the garage equipment.

K. C. B.

IDEAS: USEFUL AND INGENIOUS.

A Selection of our Readers' Home-made "Gadgets," with Practical Hints on Work in the Garage and on the Road.

Non-Slip Screwdriver.



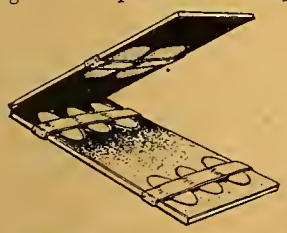
Non-slip grinding of screwdriver blade.

IF it is desired to prevent a screwdriver from slipping out of screw slots it should be ground, according to "G.W." (Sheffield), with the sides flat, and not bevelled like a cold chisel. For very tight screws, indeed, a concave form of the faces is advantageous.

Carrying Repair Patches.

UNLESS special precautions are taken inner tube patches are usually found in bad condition when the ultimate puncture occurs.

A Portsmouth motor cyclist, "G.P.," has evolved an admirable carrier for patches, made to fit the "floor" of the tool-bag. Two pieces of three-ply or



Simple carrier for repair patches.

other suitable wood are cut to shape, and each one is faced with fine emery cloth, glued on. When dry, the emery faces are brought together and the boards hinged at one end.

Three bands cut from an old cycle tube are fixed across the boards, two over one and one over the other. The patches are slipped under these bands, and the case then forms a solid base in the tool-bag, upon which its usual contents may be packed.

Repairing Bowden Cables.

IT frequently occurs that the strands at the end of a Bowden inner cable become frayed out, and with the wire in this condition it is a practical impossibility to pass the cable through the nipple which it is required to solder thereto.

This difficulty may be overcome by wrapping the wire tightly with thin copper wire at a point beyond which the fraying has taken place; the copper wire bandage should then be slipped to within $\frac{1}{16}$in. of the frayed end of the cable, and it will be found that the frayed ends will be forced together and it will then be possible to insert the projecting $\frac{1}{16}$in. of the cable into the nipple; the nipple should then be pushed back on to the cable, the wire bandage being pushed back by the nipple itself; when the nipple is in the position for soldering the copper wire may be removed.

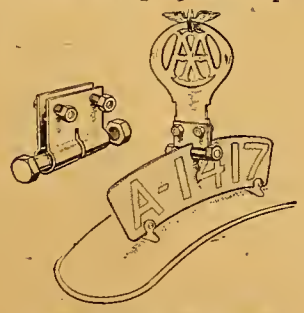
In cases where the nipple has been previously removed from the cable it is probable that the bore may be filled with solder; this will necessitate the heating of the nipple with an iron or blow-lamp to melt the solder, and the nipple should be pushed on while the solder is in a fluid state. It can then be soldered up in the usual way.

A point to remember is that, prior to the slipping forward of the copper wire bandage, the ends of the cable should be tinned, either by immersing in molten solder or by rubbing with a thoroughly tinned iron. It is of importance that any excess of solder thus applied should be shaken off whilst still molten.—C.C.R.

Badge or Licence-holder.

SIMPLICITY is the special feature of the badge or licence holder made by "A.H." (Swindon).

A piece of sheet metal is bent double round a bolt, being squeezed up in the

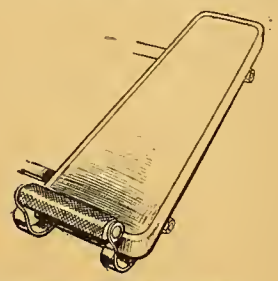


Sheet metal clip for a badge or licence plate.

vice or hammered. A transverse saw-cut and necessary holes for screws complete the fitting which is attached to the number-plate by the bolt round which it was bent.

Footboard-Footrests.

THERE are many of us who heartily detest footboards, especially on solo machines; the continual dither often experienced resulting in the foot sliding backwards, unless either the board or the boot sole be rubber covered. "C.H.H." (Derby), having a machine on which footboards are standard, has fitted to them



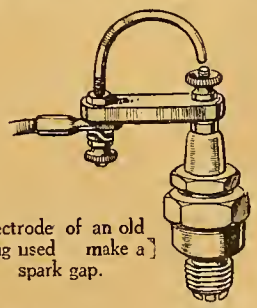
Spring mounted footrest attached to a footboard.

rearwardly extending brackets of $\frac{3}{4}$in. × 8 gauge spring-steel. Quarter bolts and nuts secure the brackets to the footboards, and between them are carried long spindles, also $\frac{1}{4}$in., over which are passed ordinary cycle pedal rubbers.

When the feet are on the boards the rubbers prevent them slipping off to the rear, or the rubbers can be used solely as footrests.

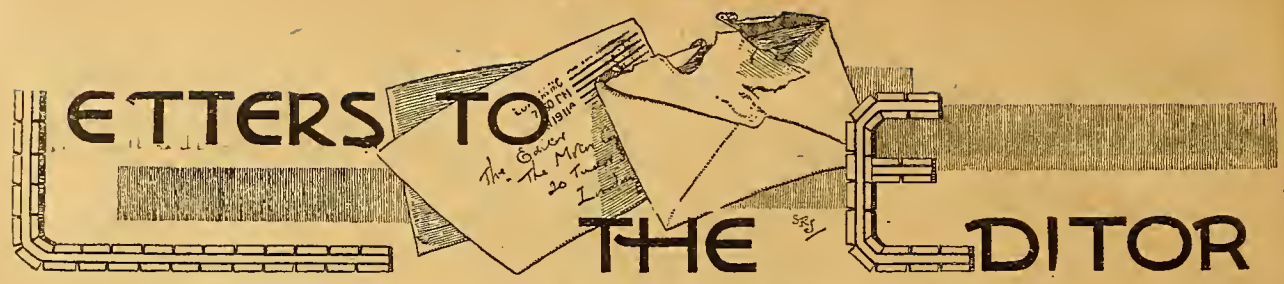
Simple Spark Gap.

THE boom in spark gaps appears to have subsided, but it is still possible to pay half-a-guinea for one if so inclined. A cheaper method is to copy the device of "J.H.," a Lancashire reader, who has turned a piece of fibre and the central electrode of a discarded



Electrode of an old plug used make a spark gap.

plug to good account. The fibre is $1\frac{7}{8}$in. long, $\frac{1}{2}$in. wide, and $\frac{5}{16}$in. thick, and the electrode is bent so that it just clears the top of the screw at the top of the plug terminal. What an opportunity, though, for spark gap publicity men, thus: "Use *our* spark gap and you will never have a discarded plug from which to make your own!"



The Editor does not hold himself responsible for the opinions of his correspondents.

Correspondence should be addressed to the Editor, "The Motor Cycle," Dorset House, Tudor Street, E.C.4, and must be accompanied by the writer's name and address.

PRICES OF ELECTRICAL GOODS.

Sir,—I had occasion a little while back to purchase a magneto condenser from a noted accessory firm; the price charged was 12s. 6d., not inclusive of fitting. My estimate of cost of manufacture, based on prices of materials (locally, retail), is as follows: Mica, 1s.; tinfoil, 2d.; two brass stampings at 2d., 4d.; base plate with threaded nipple 6d.; shellac varnish, 2d.; time for assembling at 2s. 6d. per hour, 8d.; total, 2s. 10d.

It is up to us to shout, and shout loud and long, and with "Ixion" to lead us we shall in time get reasonably priced accessories. ANTITWIST.

Brighton.

TRIALS FOR GUARANTEED SPEED MACHINES.

Sir,—In view of the fact that a large number of manufacturers are marketing sporting machines, which are advertised as being capable of certain speeds, would it not be to the advantage of the manufacturers and the buying public to have a trial of these machines on the following lines:—

A high speed reliability trial of 100 miles on Brooklands, with set speeds in each class.

Class A.	50 m.p.h.	Class C.	60 m.p.h.
„ B.	55 m.p.h.	„ D.	65 m.p.h.
„ E.	72 m.p.h.	„ F.	50 m.p.h.
„ B/S.	40 m.p.h.	„ G.	58 m.p.h.

This trial to be organised preferably by the A.C.U. in the Spring and to be open. Awards to be given to all completing the distance at or over the set speed.

If I remember correctly just such a trial was held in 1910 by the B.M.C.R.C. and proved very successful, so I claim no originality in its conception, but feel sure it would be appreciated by prospective customers and present owners. R. N. STEWART.

NAIL SCAVENGING EXTRAORDINARY.

Sir,—Is it possible to keep our roads free from iron nails, which seem to be the chief source of punctures, and so reduce this great bugbear of motorists to a minimum? I believe it is a practical proposition. In certain factories they make use of crushed coal. When first they started to break the coal up their crushing mills were being continually broken by iron bolts and nuts entering with the coal. To obviate this the coal is passed over a revolving magnetised cylinder. The coal drops away and the iron sticks to the cylinder and is automatically removed.

Now for the application.

A car could travel from London to Bath, and if it had a magnetised cylinder trailing behind it just above the road it would pick up every iron nail in its path between London and Bath. It could return and do the same for the other side of the road, and no one would have to fear a puncture from an iron nail for some time between London and Bath.

The many possibilities of the suggestion are obvious.

If the A.A. kept our roads free of nails it would be doing motorists even a greater benefit than it does at present. DONEGIAN.

Bristol.

[This letter was *not* inspired by the humorous article last week on "Accessories Before the Fact," nor was the reverse the case.—ED.]

MOTOR CYCLISTS AT HEART.

Sir,—At this season I should like to wish you and all members of *The Motor Cycle* staff, including "Ixion," a right merry Christmas and successful New Year. I should also like to thank you all sincerely for the many pleasant hours spent during the past year devouring the excellent results of your labours. Thursday morning is always pleasantly anticipated by myself, and, I am sure, hundreds of others for the welcome appearance of a new "Blue 'Un." Unfortunately, we cannot all be actual motor cyclists—for financial reasons—no matter how strongly and for how many years we have been consumed with the "stink 'bus mania," but that does not damp the ardour of a real enthusiast who continues "waiting for something to turn up"—*ad infinitum!* But it does not follow that we are useless hangers-on; for instance, only to-day I persuaded another non-financially handicapped "potential" to go in for an A.J.S.—not the first indirect order that has come through another no doubt much-despised

FOLLOWER OF THE SPORT ON PAPER.

Birkenhead.

TOO MANY T.T. RACES?

Sir,—One would assume from the vigour of Mr. Hill's argument that he is a keen motor cyclist, but his apparent lack of knowledge regarding the evolution of motor cycles rather conflicts with this. As many of your correspondents have recently emphasised, the history of motor cycle development is inseparably bound up with the records of such events as the T.T. Races and the Six Days Trials.

To reply but briefly to Mr. Hill's contention that the cost of a yearly T.T. meeting—naturally passed on by the trade to its customers—is not justified by the improvements resulting, one may recall how some of the most vital features of the present-day motor cycle have been derived through these contests. There immediately comes to mind the countershaft gear box. This reliable device was a direct outcome of the T.T. Races of about 1911-12, wherein it was proved that the glorified pedal-bicycle hub-gear would not stand up to exacting conditions. The stirrup rim brake, another survival of push-cycle days, was also disproved by the T.T., and has now been largely succeeded by more efficient and reliable internal expanding band brakes, and other systems appropriate to the types of machines on which they are fitted. It was unquestionably the T.T. Races which brought about these improvements, and if Mr. Hill had been in the Isle of Man instead of, possibly, in India when the first competing machines appeared with band brakes, he would remember the great interest that their advent evoked. Frame design, springing, steering, and other details have been vastly improved through the T.T. Races, whilst tyres of reasonable size and many other safety and comfort-providing features now universal are traceable to these contests.

The outstanding value of the T.T. has, of course, been the way in which it has led to improvement in engine design. If Mr. Hill is inclined to argue that the day has now been reached when the usefulness of the T.T. in this respect is questionable, surely he cannot have read the reports of the Races held in the past three years. These, following upon many years of steady progress attributable to the T.T., have produced the spectacle of small machines in the 250 and 350 c.c. classes putting up much finer perform-

ances than did the large machines of a few years ago. The success of the small-engined machines in 1921 and 1922 was, indeed, a wonderful testimony to the manner in which the T.T. Races of the past have "found things out." As the first people to acknowledge this are the designers and makers of the victorious machines themselves, surely Mr. Hill must see that his argument over-reaches itself.

T. W. LOUGHBOROUGH (A.C.U.).

VISCOSITY'S PART IN LUBRICATION.

Sir,—In reply to "Tan-y-Bwlch's" letter, we should like to draw his attention to a lecture on lubrication by Prof. Stanton, D.Sc., F.R.S., of the N.P.L., to the Institute of Mechanical Engineers. An account of this lecture appeared in the *Engineer* published December 8th. Dr. Stanton proved that the viscosity of an oil plays a minor part in the elimination of friction.

H. S. BRISTOWE.
G. W. LANYON.
A. L. TRUMP.

Sir,—My experience tallies to a great extent with that of "Kemist," that is, that mineral oils are far superior to castor oils for ordinary every-day lubrication. There is less carbon deposit, less corrosion, together with less sticking of valves and piston rings.

It is well known that a special tariff is offered by many oil companies to trade, and other riders who use their oils, thereby detracting very considerably from the value of the performances. Most of these racing events are run on oils specially blended for the particular events, secure in the knowledge that once the run has been completed the engine will come down for a thorough cleaning. Moreover, many of these specially blended oils could not be marketed at anything like a competitive price, and, even if they were, they would be totally unsuited to the average owner-driver.

I am not interested in the sale of lubricants in any form.

Wembley. FALCON.

Sir,—The letter by "Tan-y-Bwlch" aroused my curiosity, and I worked out the following, with results which I hope will not bring the wrath of "Tan-y-Bwlch" and Mr. Wright on my head.

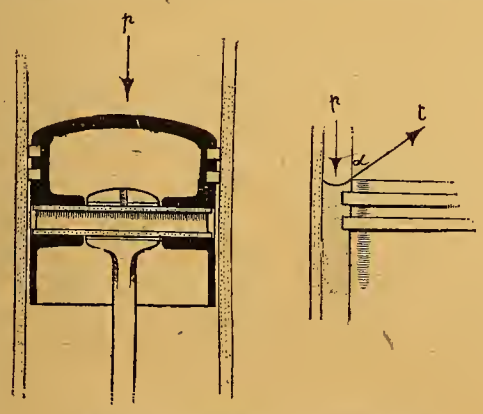


Diagram illustrating Mr. C. Jones' letter.

The left-hand sketch represents a piston and cylinder walls. On the right is an enlarged illustration of the space between the piston and the walls, the distance being exaggerated somewhat in order to make my argument more clear.

Let p=pressure/unit area of piston head exerted by exploded gases.

Let $2r$=bore of cylinder.

Let t=surface tension of lubricant used.

The lubricant being viscous it will assume the form shown, the open surface being concave.

t acts along tangent to this curve at the point where curve cuts piston.

Let α=angle which this line makes with edge of piston (called angle of contact).

Force exerted on piston head $=\pi r^2 p$.

The vertical component of t (*i.e.*, $t \cos \alpha$) acts along a circle of radius r.

$\therefore$ Force opposing motion $=2\pi r t \cos \alpha$.

Let piston move distance dx, where dx is very small. Work done by exploded gas $=\pi r^2 p dx$.

Some of this energy has been used in overcoming surface tension.

$\therefore$ Total amount of work which the piston is capable of doing $=\pi r(rp-2t \cos \alpha)dx$.

In a complete stroke this becomes :—

$$\int_0^l \pi r(rp-2t \cos \alpha)dx = \pi r l(rp-2t \cos \alpha)$$

where l=length of stroke.

Now if we increase t, α increases also, and so $\cos \alpha$ decreases, and so for a very viscous body $2t \cos \alpha$ will vanish, and the efficiency of the engine will thus increase. Hence, contrary to Mr. Wright, I maintain that viscosity does play an important part in maintenance. Again, in case of mineral oils, the viscosity decreases with increase of temperature very rapidly, but there is apparently no change in viscosity of vegetable oils, which makes the latter an ideal for speed work.

By the way, I should like to know the "iodine value" of Castrol R. and Castrol C.? Perhaps some chemist will kindly oblige. GWERFYL JONES.

BORROWED NOMENCLATURE.

Sir,—Mr. "Muggins," in your issue of December 14th, raises a vitally important question when he calls in question the terms "timing" and "tuning." The problem bristles with difficulties. Using Mr. "Muggins'" own argument, his suggested terms "setting" and "adjusting" are equally unsuitable, as a motor cycle is neither a mouse trap nor a pair of braces.

Will some philological Dr. Low help us out, or hadn't we better, perhaps, leave things as they are?

Sheffield. LITTLE EGBERT.

TAXATION BY PASSENGER CAPACITY.

Sir,—Passenger carrying should be a basis of the new tax. The lightweight machine can carry a pillion rider, and only pay £1 10s. tax, whereas the machine just over 200 lb., with a sidecar, pays £4; two persons are carried in each case. Again, the double sidecar pays the same tax—perhaps carrying three persons—as the sports sidecar, even if run empty by an elderly man for his safety.

We often see large sidecar outfits overloaded with perhaps five people and a pile of luggage, which must tell heavily on the roads compared with, say, a 350 c.c. machine with a sports sidecar. The same arguments apply to motor cars.

South Shields. "EQUITABLE TAXER."

THE FUTURE OF THE SHOW.

Sir,—I am glad that you are using your great influence in favour of continuing the Olympia Show. It would be disastrous to discontinue it and scarcely less disastrous to hold it biennially.

The objections which are urged are quite insufficient. It is said that people wait until November to purchase, and trade is held back during the autumn. Naturally; because people do not care to purchase when summer riding is over and it is too early to think of spring. The fault is not with the Show but with the seasons. On the contrary, the Show promotes trade at the end of the year which would otherwise be delayed until the New Year. December is a busy month in some works, and I doubt if this would be the case but for the 'push' of the Show.

It is said that the public waits for prices to be fixed at the Show. No doubt this is so, but if prices were not settled at a definite date, and were continually fluctuating, the public would be in a constant state of hesitation. It is regrettable that some light car firms continue to reduce prices after they have booked, or supposed to have booked, large orders at the Show. People are still wondering whether further reductions may not be made, and are actually recalling orders which they had placed. Happily this has not occurred in the motor cycle trade.

The cost of the Show is considerable, but after all the Show is a splendid advertisement (if one has anything worth

showing), and not by any means the most costly. I have reason to know that the cost can be handsomely and immediately repaid.

It is also said that motor cycles are becoming standardised and that alterations and improvements are not sufficiently striking to be attractive. The crowds at Olympia tell a different tale. Not every one is looking for novelties, and very little business is attracted by freaks. The splendid exhibition at Olympia is unique; there is nothing like it to be seen abroad. The show of French machines at the Salon was not in any way to be compared with it. It is a triumph of the British manufacturer, and it is not the fault of the Show if he fails to profit by it. H. G. MORGAN.

Sir,—I feel that the makers themselves are responsible for the fact that "a show curtails sales during the autumn months by reason of prospective buyers postponing their orders 'until after the Show.'"

This is my experience: During the last week in July I purchased a 1922 model lightweight direct from the makers, an old-established firm of motor cycle manufacturers. About six weeks later I was informed that a firm of dealers in London were offering the machine at £15 less than advertised price. The makers advertised a new model in October, and at the Show I was told they had abandoned my type of machine in favour of the new (o.h.v.) model, with shorter frame, lower saddle, modified fork with semi T.T. handlebars, in fact, a very different mount, at an advanced price of £5.

I do not suggest my 1922 machine is unsatisfactory or not worth the price charged, but had I known that it was to be abandoned entirely I should certainly have waited, and I shall want a new mount very badly before I buy one again within the three months before the Show. MUDLARK.

London, N.4.

Sir,—It may be worth while to note how the Show is regarded by our friendly critics abroad. The following is taken from *Cyclecars et Voiturettes*, a Paris organ which deals primarily with light cars and cycle cars, but is interested also in motor cycles:—

"The English show not only proves the importance of the British motor cycle industry, but is *une puissante manifestation économique*, marking the development of an industry which, having succeeded in satisfying every requirement, has reached its apogee and aims at world-wide conquest. The show gives evidence of the giant strides which have been taken towards satisfying the requirements of export trade. This statement is confirmed by the general effect of the Show, which presents the variety which is essential to the conquest of all markets. . . . It is a characteristic proof of the energy and organisation of an industry, to which it behoves us to pay attention."

If so much is gained, surely the postponement of the Show would be a serious loss. H. F. S. MORGAN,
(The Morgan Motor Co., Ltd.).

DETAIL IMPROVEMENTS AWAITED.

Sir,—Can any of your readers tell me why motor cycles improve so very slowly in certain directions?

I have in mind one particular four-stroke 499 c.c. single, put on the market last year by one of our leading manufacturers, which although an admirable production in many ways, lacks many detail improvements which would, to my mind, make it even more admirable were they included in the specification.

The improvements I suggest are:—

(*a*) An internal expanding front brake, to replace the antiquated and utterly useless horseshoe pattern at present fitted.

(*b*) Mechanical lubrication, governed by engine revolutions, instead of a hand-operated pump, which alternately flushes and starves the engine, and cannot obviously make the engine so efficient as it would be when fed by a continuous flow of oil according to load.

(*c*) A four-speed gear box which would give ratios of about 3½, 5¼, 9, and 15 to 1, instead of a three-speed box giving a top gear of not more than 4⅔ to 1. Results: Higher *average* speed, more m.p.g., and longer life to the engine, better acceleration, and greater ease of handling in traffic. T.A.869.

London, W.C.2.

STRAINS OF OVERHUNG CRANKS.

Sir,—Certain makers are introducing models with overhung crankshafts. I must say that I am rather a novice in these matters, but it seems to me that this will create an unbalanced strain on the single bearing, and that the usual two-bearing crank is a better job. NOVICE.

Manchester.

RECORD CLASSES FOR AMATEURS.

Sir,—There is little doubt that a private owner has no chance in heating, or even equalling, the speeds set up by riders with a works behind them. Should the track authorities make arrangements for a special class for real amateurs one could obtain some idea of the capabilities of a standard machine in the hands of a man of moderate means.

Lyme Regis. HUMBER SPORTS.

SCOTT-SQUIRREL GEARS.

Sir,—As another enthusiastic admirer of the Scott-Squirrel (alas! from a distance only), I should appreciate your permission to reply to Mr. Allan Hartley.

I interpret the policy which retains this machine as a two-speed close ratio one chiefly to the following:—

(1) The Squirrel is designed essentially as a sporting solo.

(2) The power-weight ratio is high.

(3) The even torque of the engine gives good pulling at low speeds.

Regarding (1), although the machine is absolutely suitable for ordinary touring, high average sustained speed is the underlying idea, and the occasions which would demand a low gear for emergency are so few and far between that the possession would be more than outweighed by the added weight and complication.

Regarding (2), it is interesting to compare this with the ordinary gear box machine. Taking 14 b.h.p. as the maximum output of a well-tuned standard Squirrel engine, and weight of machine as 210 lbs., the ratio is .067.

Assuming the same power output on a 500 c.c. three-speed gear box machine weighing 270 lbs. (a fair average weight), the ratio drops to .052, a difference very noticeable when quick acceleration is wanted.

Now the three-speed Scott would appear to be designed from an entirely different standpoint, namely, to satisfy the present tendency to cram on coachwork, passengers, and luggage. In short, designed as a sidecar machine. Admitted a sidecar can be attached to the Squirrel, but this seems like putting a racehorse between the shafts of a cab.

I for one am pleased to note that the Squirrel retains its well-tried lay-out.

To my regret, I do not write as a Scott owner, but, having swallowed much dust when being passed by many of these lucky men as I thump along on my 500 c.c. single, I sign myself. HOPETOBE.

Stockport.

Books & Maps for Motor Cyclists.

Issued in conjunction with *The Motor Cycle*.

"MOTOR CYCLES AND HOW TO MANAGE THEM."
The standard handbook of the motor cycle.
Price net, 2/6. By post, 2/10.

"TWO-STROKE MOTOR CYCLES."
Second Edition. Just Published.
Price net, 2/6. By post, 2/9.

"HINTS AND TIPS FOR MOTOR CYCLISTS."
Eighth Edition. Price net, 2/-. By post, 2/3.

"TRACING MOTOR CYCLE TROUBLES."
Fifth Edition. Just Published. Price net, 2/-. By post, 2/3.

"MOTOR CYCLE REMINISCENCES."
By "Ixion," of *The Motor Cycle*.
Cloth Bound. Price, 5/-. By post, 5/3.
Paper Boards. Price, 2/6. By post, 2/9.

"THE MOTOR CYCLE" ROAD MAPS.
Set of Three Maps—England and Wales, Scotland, London. Set of three, complete in case. Price net, 5/6. Book post, 5/10. Set of Two Maps—England and Wales, London. Price net, 4/6. By post, 4/8.

"THE MOTOR CYCLE" ROUTE BOOK.
With 32 pages of Road Maps. Price net, 2/6. By post, 2/10.

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., Dorset House, Tudor Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 1½d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the top left-hand corner of the envelope, and should be kept distinct from questions bearing on technical subjects.

ROUTES.—By special arrangement with the Automobile Association and Motor Union, readers of "The Motor Cycle" desiring routes may enjoy the benefit of the Road Service Department of that organisation. Queries should be addressed to the Editor in the ordinary way (enclosing a 1½d. stamp), and will be dealt with by the A.A. and M.U., who are regularly in receipt of reports from their representatives all over the country as to the existing state of the roads in any particular locality.

PREMIER TWO-SPEED GEAR BOX.

[?] On the Premier two-speed countershaft machine, where does one find means to adjust the clutch when it slips as mine does now, very badly?—O.E.

The clutch is inside the gear box, which must be dismantled to effect the adjustment. Probably the plates are worn.

AN UNREGISTERED MACHINE.

[?] I purchased a second-hand Rudge-Multi outfit recently, and the seller informs me that the machine has been in his works for two years or more. It has not been registered by him, and he does not now know where the previous owner is or what steps he took about the number. What should I do—try to get the number transferred to me or register the machine as one might a new one? If the former, to whom should I apply?—A.L.P.

(1.) You should write to the Clerk of the County Council where the machine was registered, explaining the circumstances fully. If the number still applies to the machine, *i.e.*, if it has not been cancelled, it will no doubt be booked to you. Alternatively, there does not appear to be any reason why you should not apply for a licence and registration as though the machine was unregistered, but it is likely that you would have to prove your right of ownership.

NEW MACHINE WON'T START.

[?] A new machine was driven to me (about twenty miles) a few days ago, and it was then, apparently, going well. I cannot now start it, even after heating the cylinder and carburetter with a blow-lamp and injecting petrol into compression tap. Can you suggest a method of starting? (2.) On pressing down the starting pedal—with all closed—there is a slight hissing noise, indicating a leakage about the top of the cylinder head, which is apparently bolted on. Does it require a new washer, and if so, of what should the washer be made?—G.J.

In all probability the fibre bush on which works the rocking arm of the magneto contact breaker has swollen through damp. You should therefore remove the contact breaker cover, rotate the engine and watch if the rocking arm is moving. (2.) Admission of air at this point may account to some extent for the difficult starting. As the machine is a new one it is likely that the cylinder head nuts require tightening? Copper and asbestos washers are generally used for head joints, and it is unlikely that a new one is needed.

Important Dates.

Fri., Jan. 5th to Wed., Jan. 24th—Italian Motor Cycle Show.
Sat., Jan. 13th to Wed., Jan. 24th—The Belgian Salon.
Fri., Jan. 26th to Sat., Feb. 3rd—Scottish Motor Show.
Sat., Feb. 24th—Colmore Cup Trial.
Wed., March 14th—A.C.U. Stock Machine Trial.
Sat., Mar. 17th—Victory Cup Trial.
Fri., Mar. 30th and Sat., Mar. 31st—M.C.C. London-Land's End Run.
Easter Monday, Apl. 2nd.—Northern Centre Hill Climb.
Fri., May 18th—M.C.C. London-Edinburgh Run.
Mon., June 11th—Junior T.T. Race.
Wed., June 13th—Lightweight T.T. Race and Sidecar T.T. Race.
Fri., June 15th—Senior T.T. Race.
Sat., July 21st—B.M.C.R.C. 500 Miles Race.

SMALL CAR PROGRESSION

"THE AUTOCAR"—published from the offices of "THE MOTOR CYCLE" and conducted on the same enterprising lines—is the complete automobile journal embracing small, medium, and large cars. Every motor cyclist contemplating the purchase of a light car should read

The Autocar

Every Friday **4d.**

Founded in 1895, *"THE AUTOCAR" is the largest and most successful automobile paper and enjoys the greatest circulation. It is universally accepted as the representative British motoring journal.*

ENGINE CAPACITY.

[?] (1) What is the bore and stroke of the four-stroke engine with overhead inlet valve which was fitted to the 1915 O.K. lightweight? (2) My crank case release is *via* the hollow crankshaft. What would cause considerable smoke to issue after three minutes' fast running?—F.C.C.

(1) The bore and stroke are 70×70 mm. The capacity therefore is 269 c.c. (2) Probably the vaporisation of the oil in the crank case, due perhaps to a slight overcharge. If the smoke is excessive there may be leakage past the rings.

SIGNS OF LONG USE.

[?] In neither top nor low gear will my 1913 499 c.c. Precision engined sidecar machine climb at all well. Frequently it gives out before the top is reached. The gear is an N.S.U. Opening the throttle does not make any difference on a slight rise but on a flat road the response is good. The engine and crank case, although lubricated well, get very hot and power seems to lag after the cylinder becomes heated. More power seems to be derived from driving with the petrol tap about ½ to ¾ turned on; when full on the engine gradually gives out and will stop. The spark has to be kept at practically a retard position to avoid knocking, and although the engine and magneto have been overhauled (a week ago) a mechanic has been unable to improve matters. What is the cause of the trouble?—F.W.

A larger jet might improve matters slightly, but it is possible that the petrol supply is partially restricted (your reference to the petrol tap confirms this). Attention should be paid to all points such as induction pipe and cylinder union and the valve guides, where air leaks can take place. The valves themselves probably require grinding in and the engine decarbonising. Be sure that the oil you are using suits the engine. The timing of the magneto is obviously too far advanced. It should be set so that the spark occurs on top dead centre with the magneto control two-thirds retarded. You do not give the top gear ratio—this may be too high. Set it at about 5 to 1; even with this the low gear of the N.S.U. device is only about 7 to 1 so that exceptional hill climbing should never be expected.

CHANGING DIRECTION OF ROTATION.

Is it possible to convert a clockwise magneto into an anti-clockwise one without any other alteration than fitting a different contact breaker?—P.W.

Single cylinder and 180° twin magnetos in most cases can be altered in direction merely by the replacement of the contact breaker (necessitating in some cases a new cam ring also). V-twin magnetos may require a new armature, and in certain instances even new magnet pole shoes would be needed.

LIABILITY FOR DAMAGED HEN.

Should a hen in running across the road collide with a motor cycle and, in consequence, die, is the rider responsible at law for the damage? Can the owner obtain its value by legal action?—D.R.

Domestic animals have an equal right, with vehicles and persons, of being on the highway, providing that they are under control. It is the duty of all drivers to exercise reasonable care in passing them, whether they are under control or not. In the circumstance described, if no negligence is proved against the rider, he would not be liable for damages.

TAX ON UNUSED MACHINE.

In January last I paid a quarter's tax on a B.S.A. motor cycle, which was used till the end of March. I then bought a lightweight, and have used this only, discontinuing the use of the B.S.A. entirely, although it is still in my possession. Am I liable to tax on the *two* motor cycles? I am under the impression that, as the one motor cycle has not been used since the second was bought, I am not. The authorities are insisting on the payment of the tax for the remainder of the year on the first machine.—A.B.G.

If you can prove that the machine has not been used (and if the authorities cannot prove otherwise) there does not appear to be any reason why you should pay. When laying the machine up, however, you should have safeguarded yourself by advising them of your intention.

EXPERIENCES WANTED.

Readers' replies to questions published under this heading should be addressed c/o The Editor, "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4, when they will be forwarded direct to the querists concerned. Requests for experiences should be accompanied by a stamp.

"R.H." (Liverpool).—349 c.c. Sports A.J.S. : performance with Binks three-jet carburetter.

"B.T." (Eccles).—Black Prince cycle car.

"D.H." (Houston).—Flywheel lighting set on Villiers two-stroke engine.

"B.P." (Otley).—143 c.c. Atlas and 165 c.c. Economic.

"W.J.R." (Bristol).—496 c.c. Lea-Francis (1920 model) : Binks carburetter and jet sizes, suitable oil (engine and clutch), spanners needed for dismantling cylinders.

"C.E.P." (Croydon).—Tuning 211 c.c. single-speed Levis for speed; suitable exhaust system.

"C.F.C." (Sheffield).—348 c.c. Raleigh and 348 c.c. Henley-Blackburne.

SPARKLETS.

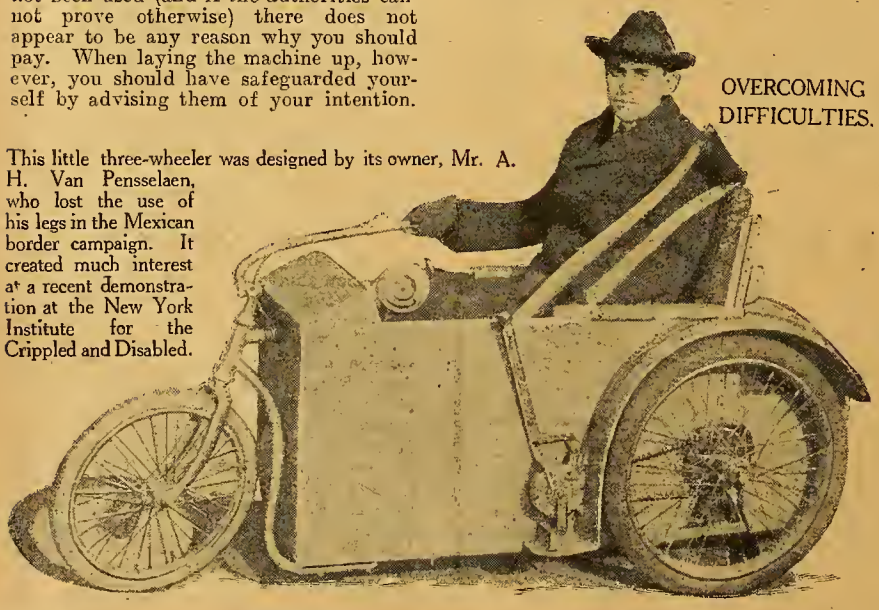
To Sleeve Valve Users.

Instruction books and lists of spare parts relating to the B. and S. sleeve valve engines are now available from Barr and Stroud, Ltd., 15, Victoria Street, London, S.W.1.

Overhead Rocker Lubrication.

Having proved its efficiency on the 350 c.c. single-cylinder models, the wick feed lubrication to the overhead valve mechanism is now to be applied to the 500 c.c. flat-twin Bradshaw units. J. Walmsley and Co. (Preston), Ltd., can supply similar gear for all 1921-22 flat-twin models.

OVERCOMING DIFFICULTIES.



This little three-wheeler was designed by its owner, Mr. A. H. Van Pensselaen, who lost the use of his legs in the Mexican border campaign. It created much interest at a recent demonstration at the New York Institute for the Crippled and Disabled.

Record Records.

In the list of records published in our last issue, it is noteworthy that the Douglas machines figure in no less than 68.

A Motor Cyclist's Calendar.

The A.C.U. has produced a motor cyclist's calendar, well illustrated, and unostentatiously setting forth the advantages of membership of the Union.

Steel Pistons.

The sale of Zephyr pistons has been taken up by Barimar, Ltd., 10, Poland Street, Oxford Street, London, W.1; sizes to suit all makes of engines can be supplied promptly.

£1,000 for Trade Fund.

Reports from the Manchester Centre of the Cycle and Motor Trades Benevolent Fund reveal that nearly £1,000 has been collected in aid of bereaved or otherwise distressed members of the cycle and motor trades.

Replacement Piston Rings.

No longer is it necessary to buy rusty piston rings which have deteriorated in some agent's stock. The British Piston Ring Co., Ltd., of Coventry, is now packing each individual ring of its vast range of sizes in a separate grease-proof bag of distinctive design.

Change of Depot Address.

In announcing the new Manchester address of Messrs. Parker's, automobile engineers, at 246-252, Deansgate, it should have been mentioned that this change of address of the Manchester depot in no way affects Messrs. Parker's parent depot at Bolton.

For Coachwork.

Free samples of Chemico car polish are available to all who forward a request to the County Chemical Co., Ltd., Chemico Works, Birmingham. The polish is admirable for sidecar and other body-work, and for polishing and preserving enamelled frames, tanks, etc.

Successful.

In sixteen speed events in the north during 1922 R. T. Cawthorne, of Meanwood, Leeds, secured 19 cups, 1 shield, 7 special awards, and 75 medals. In all but one event he made fastest time of the day. His machines are standard side-valve and o.h.v. Nortons, and it is claimed that the same C.A.V. magneto was used throughout on the side-valve model.

Carelessness.

Complaints are frequently received from advertisers in *The Motor Cycle* that letters and postcards from enquirers are received which have neither name nor address.

The writers are probably unaware of what they have omitted, and consequently think that the advertiser is to blame.

Catalogues Received.

The H. G. Hawker Engineering Co., Ltd., Canbury Park Road, Kingston-on-Thames.—Folder describing all models of the Hawker motor cycles.

Geo. Brough and Co., Haydn Road, Nottingham.—Catalogue of prices of the various Brough Superior models.

1922 A.C.U. SIX DAYS TRIALS.

"BONNIKSEN"

AGAIN AMONGST THE PRIZES.

23 GOLD MEDALS.
2 SILVER MEDALS.
1 BRONZE MEDAL.
2 CERTIFICATES.

THE RELIABILITY PREMIERSHIP.

Acknowledged to be the most accurate and reliable Speedometer on the market and a boon to Competition Riders.

PLEASURE OR DISCOMFORT

WHICH do you get from motor-cycling? There is no need to ride unprotected—"Easting" Sidecar and Handlebar screens will make riding comfortable even in Winter.

The "Easting" Tourist Handlebar screen can be fitted to any motor-cycle, and raised or lowered to suit the individual riding position of any motor-cyclist on any machine. Clips are provided for attaching to "Sterling Leg Shields" if so desired.

An extract from the "Birmingham Evening Despatch":

"It was a unique experience to bat along at 35–40 m.p.h. without watery eyes, to be able to enjoy a cigarette or pipe without the rushing wind robbing its fragrance, and above all at the end of 160 miles' run, to feel uncommonly fresh and clean."

SCREEN with APRON £2 14 0

The "Easting" Sidecar screen is adjustable to give the utmost protection in any weather conditions—Hail, Rain or Snow, and makes a sidecar as cosy as a coupe. They are made in three models:—

Reduced Prices :

ROYAL £4 12 0 **STANDARD £3 12 0**
BABY £2 15 0 for Sporting Sidecars.

EASTING WINDSCREENS, LTD.
132, Steelhouse Lane, BIRMINGHAM.
London Office:
24, Finsbury Square.

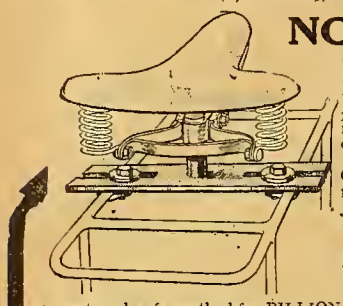
WHY

YOU should order

THE "SAFER WAY" Pillion Adaptor

(P/Pat. 20169/22)

NOW!



The big demaod for this adaptor *proves* its utility and efficieocy.

Order now for early JANUARY delivery.

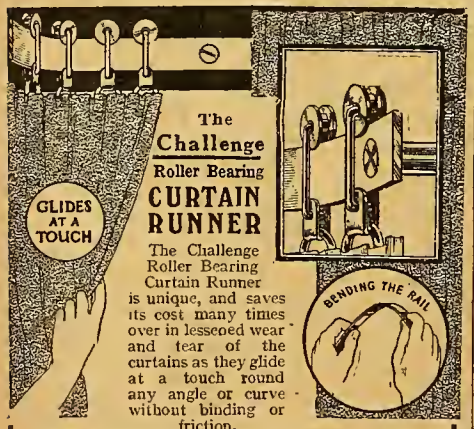
Recognised by all experts as th correct and safe method for PILLION RIDING, the "SAFER WAY" Adaptor fills a long-felt want, and gives.

1.—The **CHOICE OF A *SADDLE* SEAT**, with its luxurious springing, as a *PILLION* Seat.
2.—**COMFORT, with SAFETY.**
3.—**The ADVANTAGE OF BEING HYGIENIC. Ordinary Pillion Seats, with cheap upholstery, *hold* dampness from rain. A leather *SADDLE* is easily dried.**
4.—**A CHEAP PILLION. A discarded or borrowed saddle can be utilised with great success.**
5.—**Such Saddles as B.220, B.225 (Brooks), and Pan Seat 8 or 9 (Lycetts) with the "Safer Way" Adaptor form the IDEAL pillion.**

PRICE 7/6.

Postage 1/- extra.

Sole Mfrs.: **CUNDLES,** 'Phone:
26 & 28, BYROM ST., LIVERPOOL. North 1679



The **Challenge** Roller Bearing **CURTAIN RUNNER**

The Challenge Roller Bearing Curtain Runner is unique, and saves its cost many times over in lessened wear and tear of the curtains as they glide at a touch round any angle or curve without binding or friction.

The flexible rail can be easily bent by hand to fit *any* shaped window, and is so strong that it will carry any weight draperies. *Send for List M.C.*

CHALCO LTD., Dept. M.C., 49, Summer Row, B'HAM.

MOTOR DRIVING MADE EASY

BY B. H. DAVIES.

A simple course of instruction by an experienced owner-driver.

Price 3/- By Post 3/4.

From
ILIFFE & SONS Ltd., Dorset House, Tudor St., London, E.C.4, and leading booksellers.

THE BEST INVESTMENT FOR THE New Year is the DOUGLAS.

The 2¾ h.p. Douglas, complete with **FULL EQUIPMENT** of Lamps, Horn, Licence Holder, Tools, etc., at £50 is cheaper than pre-war.

You will never regret buying a Douglas because it is manufactured by a firm whose reputation and experience of the horizontal twin is unrivalled. It is not an experimental job, and has stood the test of years. Its merit is proved by the present rush of orders.

Don't wait until "waiting lists" prohibit prompt delivery. Make quite sure of securing a Douglas, and let me book your order NOW, either for immediate delivery or for delivery at your convenience. CASH or TERMS arranged to suit you, and arranged in the easiest possible manner.

Write me immediately for a copy of the interesting 1923 Douglas Catalogue. I will give you personal attention, and the best possible service backed by ten years experience at the Douglas Works. I will tune your new Douglas and will guarantee satisfaction.

The Special Douglas at £52, fitted with Zoom ! Zoom !! Exhaust System, my latest Alloy Air Cooled Valve Caps, Combined Aluminium Footboards and Footrests, Special Valve Springs, etc., and **GUARANTEED TO DO 55 m.p.h.**, is a wonderful attraction. Every purchaser is delighted.

HERE ARE SOME OF MY SPECIALITIES:—

THE TONY COMBINED ALUMINIUM FOOTBOARD AND FOOTRESTS. Beautifully finished—giving a natural riding position. A real solid cast job. Something that lasts for ever. Price **30/-** per pair complete.

AIR COOLED VALVE CAPS. My latest are covered by patents. They never blow out nor seize in the threads. Absolutely gas-tight. Prevent knocking and keep the engine cool. Try them on your 2¾ h.p. or 4 h.p. Douglas, and if you are not absolutely satisfied have your money back. Price **4/-** each.

BARREL VALVE SPRINGS. These springs prevent bouncing, and lighten the work on the cam. They are unbreakable and flexible. For 2¾ h.p. Dougs. Racing **2/-** per pair; touring **1/6** per pair. Do not compare these with the cheap springs that are flooding the market.

THE LUCKY SCOT. Douglas mascot in Gilt and Coloured Enamels. Real Silk Douglas Tartan Scarf, **1/3.**

The Spring in its normal position.

The Spring heavily loaded. Movement 4 ins.

UNBREAKABLE SIDECAR SPRING. GUARANTEED FOR 12 MONTHS.

Double the comfort. Actual photographs reproduced showing the wonderful 4in. movement of the spring. You can practically turn this spring inside out, and it will return to its normal setting without fracture. Its secret is in its self-shock-absorbing qualities, and it works both ways, thus taking the rebound, which is also absorbed by friction. Have one fitted to your chassis, and you'll be surprised at the added comfort. Price **17/6.**

SPECIAL LODGE PLUGS, Mica with radiating fins. The best plug for hot stuff engines. Absolutely new. W.D. surplus. List, 8/6 to clear, **2/9.**

BLACK METAL-LINED INFLATORS with long connections and foot attachment to fit Douglas Clips. List 8/6, to clear, **6/-.**

Any Spare Part by return of Post.

A complete treatise on the two-stroke motor cycle written from the point of view of the rider.

SECOND EDITION.

Price 2/6 net. By post, 2/9

From ILIFFE & SONS LTD., Dorset House, Tudor Street, London, E.C.4, and leading booksellers.

Don't let Troubles Trouble You

When anything goes wrong with the machine, consult

TRACING Motor Cycle TROUBLES

By "Road Rider"

Fifth Edition
Just Published

THE BOOK gives an ingenious method of locating any fault that may arise with a motor cycle on the road, and also shows how the trouble may be remedied.

It is equally useful, whether the rider knows what is wrong with his machine or is in doubt regarding the cause of the fault. Both four-stroke and two-stroke motor cycles are dealt with.

Price 2/- Net. By Post 2/3

Obtainable from the Publishers, ILIFFE & SONS LTD., Dorset House, Tudor Street, London, E.C.4, and Leading Booksellers.

The 21st Edition of

The "TRADER" HANDBOOK

The Standard work of Trade Reference.

Previous editions of this valuable reference book have proved that it is indispensable in every Office, Showroom and Garage.

It is essentially a book to be *used,* not put on the bookshelf. There is no need to wade through masses of useless material. "The Trader Handbook" is replete with "live information" compiled and revised with an intimate knowledge of the needs of the trade.

The 21st Edition represents a distinct advance on previous issues, new features having been incorporated, and the more important reference sections considerably extended.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words 3/-, and 3d. for every additional word. Paragraphs of under 8 words are charged double rate. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable to ILIFFE & SONS Ltd., and crossed & Co. Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle" by the first post on Friday morning previous to the day of issue. Advertisements that arrive too late for a particular issue or that are crowded out will automatically be inserted in the following issue unless accompanied by instructions to the contrary.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box ooo, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. ooo, c/o "The Motor Cycle," Dorset House, Tudor Street, London, E.C.4. *Readers who reply to Box No. advertisements are warned against sending remittance through the post except in registered envelopes; in all such cases the use of the Deposit System is recommended, and the envelope should be clearly marked "Deposit Department."*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the machine offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor. Carriage is to be paid by the buyer, but in the event of no sale each party pays carriage one way. The seller takes the risk of damage in transit. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, 1%. All deposit matters are dealt with at Dorset House, Tudor Street, London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

The Sign of G Good Service

MAKE 1923

A GODFREY'S YEAR

A New Year's Resolution easy to make and one, once made, you will have no inclination to break.

NEW MODELS.

Godfrey's can supply any make of motor cycle or light car either for cash or Deferred Payments.

SECOND-HAND MACHINES.

Godfrey's second-hand machines can always be relied upon to give good service. Their overhaul is not perfunctory adjustments just to make "the wheels go round," but a serious and thorough examination (and renewals where necessary) of all working parts.

EXCHANGES.

Godfrey's will allow you the utmost value for your old mount in part exchange for either a new motor cycle or light car.

REPAIRS.

Godfrey's are Official Repairers for London for B.S.A., INDIAN, and LEVIS motor cycles, and undertake repairs and overhauls of all makes. Free estimates can be obtained from our Works, 14, Miller Street, Camden Town, N.W. ('Phone Museum 2434.)

SPARE PARTS.

Godfrey's specialise in spare parts service and carry full range stocks for B.S.A., LEVIS, INDIAN and SCOTT machines.

Orders by post attended to same day as received.

Call and inspect our splendid stock of 1923 Models or allow us to send you catalogues.

"THEY SERVED ME WELL."

A customer once said this of Lovetts, and others are daily expressing the same opinion in various ways.

Lovett's can and will serve you well also if you will give them the opportunity.

In buying a new machine at Lovetts you simply make your choice and leave the rest to them. You are relieved of the trouble of registration, obtaining a licence, writing the number plates, insurance, &c., &c., and if you so desire an experienced mechanic is placed at your service to instruct you in driving and the care of your machine, which is eventually sent carriage paid to your door.

Lovetts also offer you the best possible selection to choose from, as their Agencies include

A.J.S.
ARIEL.
B.S.A.
DOUGLAS.
EXCELSIOR.
HAWKER.
LEVIS.
MATCHLESS.
NORTON.
NEW IMPERIAL.
ROYAL ENFIELD.

TRIUMPH.

SECONDHAND.

The customer who wishes to buy a secondhand motor cycle receives the same courtesy and attention and an equally good variety of models is available to him. Our stock is too large to detail in this column, but a complete list will be sent upon request.

An important point to be borne in mind is that Lovetts overhaul their Secondhand machines so thoroughly that they are able to issue with each a written guarantee similar to that given by the manufacturers when new.

In the matter of

DEFERRED PAYMENTS

Lovetts offer their clients the most convenient arrangements and the easiest possible terms.

Matador.

MATADOR.

WE have a job to keep stock of these machines. Everybody wants them.

DON'T be left without one. You will be sorry if you are, when you see them about.

WRITE for particulars to-day. It is fitted with 2¾h.p. o.h.v. Bradshaw engine, has an excellent finish, Burman gear box, 3-speed, clutch, and kick-starter, capable of over 60 m.p.h., and holds the road like a Rolls.

SEND your enquiry along to-day to Allan Gruzelier, Ulster Chambers, 168, Regent St., Sole Distributers. [5852

SOUTHPORT.—Kents for Matadors; immediate deliveries 1923 models.—417, Lord St., Southport. [5864

IGNITION, LIGHTING, ETC.

AN Amazing Offer.

COUNTY of London Engineering Works, Ltd.

WE hold the largest and most varied stock of magnetos and spare parts in England. Our stock comprises over 30,000 magnetos, and an inside estimate of our spares is £250,000. We would bring to your notice that these magnetos are not old discused magnetos painted on the outside to look like new, like many being offered to the public like so-called magneto specialists and experts, but are new unused Government surplus, and every magneto, previous to being sold, is thoroughly overhauled and subjected to the same test as by the makers.

GUARANTEE.—These magnetos are all fully guaranteed for 12 months against all defects, and should any magneto at any time within this period prove in any way defective, we will willingly replace or repair same free of charge. Approval.—Notice, all goods sent on approval for 14 days per return of post on receipt of cash, and in the unlikely event of these goods not meeting with your entire satisfaction, we will refund cash in full, making no deductions for packing or carriage. Magnetos despatched through this paper's deposit system if required.

BOSCH ZA1 and ZA2; £4/10.

BOSCH ZE1, ZE2 and ZEV, all degrees; £5.

BOSCH ZU1 and ZU2; £5.

BOSCH DU2, open type; £4/10.

THOMSON-BENNETT AM1, AM2, and AMV, all degrees; £2/15.

THOMSON-BENNETT AC1, AC2, and ACV, all degrees; £3/10.

THOMSON-BENNETT ASC2, for 180° 2-stroke; £4.

THOMSON-BENNETT AD2; £3/10.

C.A.V., Type 3U1. This magneto can also be supplied with Rudge spindle; £3.

C.A.V., Type 3U2; £3.

C.A.V. KU1 and KU2 pattern; £2/10.

E.I.C., Type A1, A2, and AV 2, all degrees; £3.

M-L, Type PM1; £3/5.

EISEMANN WGD2, 180°; £4/15.

MEA, Type M1; £4/15.

HECO BX2, 180°, with dist. board; £3/15.

SPLITDORF EU1 and EU2; £2/5.

SPLITDORF EUV, all degrees; £2/10.

DIXIE M20/21 and M1; £2.

BERLING N11 Single-cyl.; £2.

THESE Magnetos are all enclosed waterproof and variable ignition unless otherwise specified.

REPAIRS.—Magnetos, starters, and dynamos.

IF you have one of these for repair, save money and send it to us for an estimate. Remember, we hold the largest stock of magnetos and spare parts in Great Britain, and have one of the finest workshops fitted with the most modern appliances, especially for this type of work. All repairs guaranteed for 12 months.

SEND your next repair to us; it will pay you.

Carburet Works, Witton, Birmingham.

Telephone: East 301. Telegrams: "Carburet, Birmingham."

"Ixion" knows how to keep dry!

"Finally I bought a first-grade suit of grey Oilskins made by Barbours "of South Shields, and found I could ride my 200 miles of a trial, "stand in a steady downpour through two hill-climbs per diem, sit on "wet grass banks when my legs wearied, and get into the hotel at night "bone-dry; moreover, if the oilies were hung up over night in a wall-"less stable for the draughts to play around them, they were invariably "bone-dry long before the first competitor got away next morning."

"Ixion" in his Occasional Comments—"The Motor Cycle."

Money back in full if they go sticky, leak, or fail on any point.

Beacon Oilskins

DON'T GO STICKY OR LEAK.

The Beacon Motor Cycling Suit will keep you as dry as it does "Ixion," and will enable you to drive all day against wind-driven Rain and Sleet without letting you get wet or chilled.
Black double lightweight Jackets with Windcuffs, double fronts, and two roomy pockets, **25/-**, semi-buttoned Legging Overalls, **14/-**.

SUIT COMPLETE (post free) **39/-**

"Fairly Put New Life into the Old 'Bus'"

I say without fear of contradiction: There is no finer oil on the market than PRICE'S HUILE DE LUXE.

The hundreds of letters received by PRICE'S this season tell enthusiastically of the excellent results consistently obtained.

Delightfully clean and cool running.
Easy starting, first kick every time.
No excessive carbon deposit.
No gummy mess in the crankcase, nor stuck valves.
Better pulling and reduced fuel and oil consumption.

The secret is in the constituents they use. **Remember, Price's are practical people!**

PRICE'S PATENT CANDLE COMPANY LIMITED,
BATTERSEA, S.W. 11.

THE MOTOR CYCLE 3D

DECEMBER 28TH, 1922.

Racing *versus* Touring.

FOR motor cycle racing, plugs specially designed solely to withstand excesssive heat have to be used.

In everyday touring such plugs would be unsatisfactory because they would oil up too readily. The average well designed touring engine does not get too hot, so that a standard 3-point plug designed for maximum efficiency under the widest range of running conditions can be used.

Lodge plugs excel in both racing and touring, as the following successes gained during the past season by motor cycles fitted with Lodge plugs will testify:

Speed

27 World's records.
19 British records.

First time **100 m.p.h.** attained on 3½ machine.

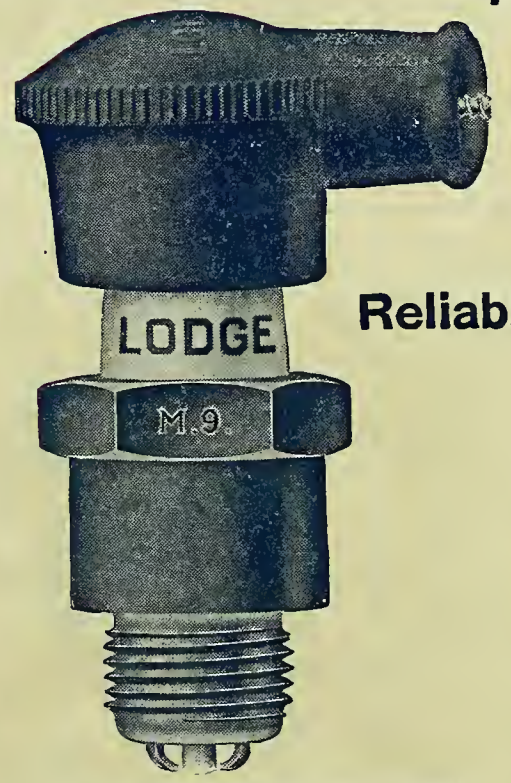
Highest speed (**100·45 m.p.h.**) on road in Great Britain.

First time Brooklands lapped at **100 m.p.h.**

Reliability

12 and **double 12 hr. records** on 2½ h.p. machine using Lodge plugs.

70% of the makes of machines exhibited at Olympia equipped with Lodge plugs.



Riders in winter reliability runs can avoid plug troubles and lost marks by fitting Lodge Weatherproof plugs.

Model M9. **6/6** Of all garages.

Packed in sealed green metal box.

LODGE

PLUGS

Designed for maximum power.
